Horse-power Rating.

A Treasury Committee has been appointed to consider the horse-power rating of motor cars and motor cycles, and the Auto Cycle Union has been invited to send a representative to give evidence on its behalf before the Committee. It is not as yet known what the intentions are with regard to the taxation of motor cycles.

THE COVENTRY AND WARWICKSHIRE MOTOR CLUB OPEN RELIABILITY TRIAL.

(1) Scene at the start. (2) Miss N. Hough (Douglas) who rode splendidly. (3) W. G. Blatch (3½ n.p. Rudge) on Ilmington Hill. (4) W. F. Newsome (Ivee and Triumph) who secured first place in Class A. (5) A. Millidge (Premier). (6) H. G. Hill (Calcott) on Sudeley Hill.

Dissolved Acetylene for Motor Cycles.

Some weeks ago I mentioned that most American riders dispense with acetylene generators, and carry tanks of dissolved acetylene, which can be relied upon to feed clean gas for many hours. Readers will be interested to hear that the well-known D.A. people are preparing to supply English riders with suitable cylinders. The first cost is rather high; I am just paying £3 15s. deposit on a test cylinder, but the cylinders contain five cubic feet of gas, sufficient for about twenty hours' night riding, and the exchange fee is only 2s. 6d., while there are exchange depots in all the large towns. The cylinders are quite compact in size, and thoroughly suited to carriage on a motor cycle, and there is not the least danger of explosion. The system is likely to be in full working order by next year, though I believe it is useless to attempt purchase immediately, as the country stockists cannot at present be provided with exchange cylinders of motor cycle size. Twenty hours' light for half a crown is by no means dear, and the cylinders will doubtless be very popular in twenty-four hours' trials next season. One cylinder would last a good many touring amateurs for an entire season.

Automatic Carburetters.

I read "E.M.O.'s" article on the above subject with great interest. I think controversialists generally overlook the fact that the choice at present is not between perfect efficiency obtained by two lever carburetters, and imperfect efficiency obtained by a single lever type; the real alternative for most riders is between imperfect efficiency with either one or two levers. Let me explain this.

The great factories very seldom send out two-lever carburetters adjusted to give perfect efficiency; if they did the control would be far too delicate and sensitive for a duffer to get good results on cornersome steep hills, and under other circumstances which constitute emergencies if the rider be timid or unskilful. At most factories the standing instructions given to fitters and testers result in a carburetter adjustment which is "rich all through." Consequently, even if we admit that existing types of automatic and semi-automatic carburetters fail to attain ideal efficiency, the standard two-lever type has real defects in practice.

Probably the only riders whose carburation at all approaches ideality are those amateurs and professionals who do not rest content with average adjustments.

Per contra, here are details of three carburetters with which I have been experimenting of late.

No. 1. Hand extra air and spring valve. Provided the spring be kept correctly adjusted, the hand extra air may be ignored and left idle, except when it is desired to obtain maximum fuel economy, or maximum speed on the level. The adjustment of the spring valve is mechanical, since the spring has to act under a given pull, and to open a given distance. This is more efficient and more suited to novices than the standard two-lever type.

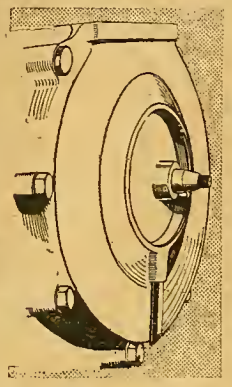
No. 2. Three-jet type, single lever. An ideal carburetter when once correctly adjusted. It meets all "E.M.O.'s" criticisms, inasmuch as the third jet, being small in proportion to the others, weakens the mixture for speed work on the level when the single lever is opened to its full extent, and if only two jets be open a rich mixture is available for slow engine speeds on medium large throttle opening, as in hill-climbing. Defect—difficulty of suiting three jets and choke tubes, in complex relationships, to different engines; need of re-adjustment to suit quality of air under diverse climatic conditions. This carburetter is not to be recommended, because of the complexity of its adjustment.

No. 3. Similar to No. 2, except that it has a plate on the spraying chamber which enables the air to be adjusted to suit different localities or different temperatures without interfering with the jets or choke tubes. This is a first-rate carburetter, absolutely economical and efficient, and may be recommended, because the complexity of the original adjustment is only a small objection, since the adjustment, once made, is final, and is modified only by altering the small plate.

These are but three out of numerous alternative designs, and two of them are equal in technical efficiency to the standard two-lever type, as adjusted by the average maker.

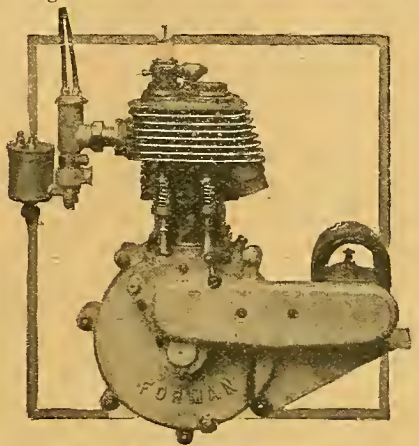
"Four Gold Medals Lost by Tyre Troubles."

The above is a pregnant sentence from the judges report on the last A.C.U. One Day Trial. How much longer is under-tyring of machines to continue? It is common in the car world as well. The fierce price competition causes manufacturers of both cars and cycles to fit as standard, tyres which are too light for their work. With luck and with attention they will cover a mileage long enough to prevent customers from clamour, and in their ignorance the purchasers remain content to buy small thin tyres, simply because they do not know that tyres are made which will take them through a season without any trouble at all. There are tyres on the market which will average 3,000 miles on the back wheel of a 3½ h.p. without more than one puncture at the outside. But these tyres are expensive, and competition prevents their being included in list prices, and many buyers are ignorant of the contrast between them and the standard light types. Here are some illustrations.

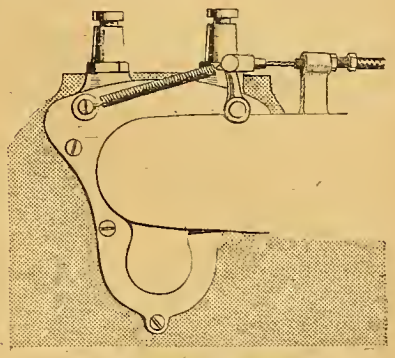


Last year I used three light covers in 1,500 miles on my back wheel, and afterwards fitted a heavy tyre which ran 3,200 miles without a puncture. The three light covers punctured on fourteen occasions before giving up the ghost for various reasons. In many cases the firms are themselves ignorant. They have large contracts for light tyres, and they are compelled to use light tyres in sprint work, so they thoughtlessly put their trade riders into the six days' events, and other smaller competitions, on the same overworked covers.

A NEW ENGINE.

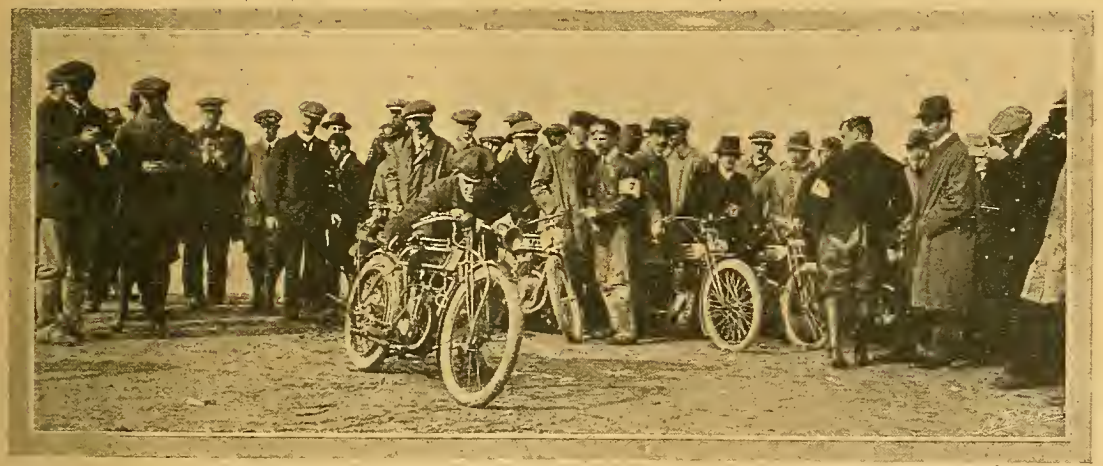


The Forman Motor Co., of Coventry, are placing on the market a very neatly designed 2½ h.p. power unit. It is primarily made to suit those motor cycle companies who do not manufacture their own engines. The bore and stroke are 70 × 76 mm. respectively, giving a cubic capacity of 292 c.c. The cylinder casting is a particularly clean one, and has the valve ports disposed at the side as in usual practice, and square radiating fins. Valves are of large diameter and very strong at the junction of stem and head; they show evidence of careful design and long experience, for though no weight is spared where it is important, the head is recessed on the under side so as to save unnecessary metal. The crank case is of aluminium fitted with chilled phosphor bronze crankshaft bearings of ample proportions, and hardened steel timing gear bushes. Only one pair of gear wheels is used, the two cams lying one behind the other and operating the tappets through rocking arms. The outer end of the camshaft carries a chain sprocket and drives the magneto in the usual way, the magneto platform being cast with the crank case. Cast with the pulley side of the crank case is a large oil catcher, having a drain pipe from the bottom, and on timing gear side is a well designed release valve, which can be easily dismantled and has no small parts to get out of order. The piston is light and fitted with two stepped rings at the top, and a wide ring retaining the gudgeon pin. The connecting rod is fitted with phosphor bronze bushes, and is a light but strong forging.



Showing design of valve head.

Oil catcher on pulley side.



New 2½ h.p. 70 x 76 mm. Forman engine.

The valve lifter mechanism.

Either Bosch, Simms, or Ruthardt magnetos can be supplied, and the Brown and Barlow carburetter is a standard fitting. Altogether we were very well impressed, both with the design and manufacture of the engine, and it should have a ready sale in these days of highly efficient 2½ lightweights. The Forman Co. were pioneers in the motor cycle engine trade, and many of the old Excelsior engines made by them are running to this day.

The firm are well-known as manufacturers of launch engines and of fire engine pumping gear, etc.

RACING AT PORTMARNOCK BEACH. J. J. Farrell (2¾ h.p. Humber) starting in the thirty miles handicap.

THE AUTO CYCLE UNION SILENCER TRIAL.

It was mentioned in our first announcement concerning the silencer trial that the standard of silence would be judged by means of a simple form of silencer, consisting of two tubes sliding one inside the other, which would allow the judges to see the capacity necessary to render the noise inoffensive in their opinion. It has now been decided to start experiments in this direction, as soon as the experimental silencers have been constructed, on two standard motor bicycles on the road. A Triumph and a Rudge will probably be chosen for the test.

As soon as the requisite standard of silence has been arrived at, full particulars will be forwarded to prospective entrants so that they have a basis on which to work. In the final test of silencers submitted, weight, volume, practicability, and silence will be taken into consideration. Those submitted must not, of course, make more noise than the standard silencer. At the last meeting of the A.C.U. Silencer Sub-committee, Messrs. F. E. Baker (Precision), C. W. Hathaway (Triumph), and John V. Pugh (Rudge) represented the Manufacturers' Union, and a vote of thanks was passed for their assistance. It is probable that representatives from the Local Government Board will be invited to witness the trial. The date of the preliminary tests will be announced later.

Registration Numbers.

Buyers and sellers of second-hand machines are advised not to neglect the necessary transferring or cancelling of the registration number. When a machine is sold, the registration becomes void unless transferred. At Ryde recently both parties to a transaction of this kind were fined 1s. and 11s. costs each.

TRICAR CONVERSIONS.

TWO INTERESTING EXAMPLES OF REJUVENATED TRICARS.

WHAT has become of all the old tricars that were built six or seven years ago? This is a question which we are often asked, and surely not without reason. The light forecar or motor bicycle attachment has died a natural death, for, though we derived much enjoyment out of this type in the early days, it must be confessed that the majority of them were most uncomfortable owing to the lack of suitable springing, under-powered, and suffered for the want of a reliable change-speed gear. Some of the better machines are still occasionally to be seen on the road, but it would be kinder not to enquire too closely into the whereabouts of the rest. But what about the heavier and expensive coach-built two or three-speed type, or the car on three wheels which appeared about 1905? Between that date and 1908 a large number of machines were manufactured by such reputable firms as the Singer, Riley, and Lagonda Cos. These were well-built machines with a fast turn of speed, and possessing good hill-climbing capabilities. Some of them certainly had their vices, as did most early machines. The steering gear on some was crude and caused one's arms to ache horribly, some were weak in the frame, and some had rear wheels which lay down round corners, but mostly they were praiseworthy machines for their day, and we cannot believe that they have already lived out their allotted time.

Since the rapid growth of the cyclecar movement a development has taken place which bears out this idea, for hardly a week goes by in which we receive no photographs or descriptions of sociable type vehicles converted from old-pattern tricars. Some are weird and wonderful contrivances, others look neat and up-to-date, but all are the genuine article rejuvenated, with side by side seats, possibly a body removed from an old two-seater car, and a new coat of paint.

TWO INTERESTING CONVERSIONS.

1 and 2 show a 9 h.p. Singer tricar converted into a sociable by A. W. Ayden, of Finsbury Park, N. The body was home made.
3 shows a side-by-side seated sociable which was once a Riley tricar, reconstructed by W. Baxter, of Morley, near Leeds.

To Obtain a Passenger Machine at Moderate Cost.

Now for the man who desires to carry a passenger in comfort and cannot afford a new machine there are great possibilities in this type. Old pattern three-wheelers up to 9 or 10 h.p., of staunch construction, can be picked up at very low prices, partly because their appearance is out of date, and partly because in the old tandem form of position, with the driver's and passenger's seats wide apart, it was not easy to carry on a conversation without the risk of a permanently cricked neck for the passenger. A little ingenuity, the assistance of the local agent, and a moderate outlay will get over both these troubles, and by attention to weight distribution, not only can greater comfort be obtained, but the upkeep can be materially reduced, as the position of the seats greatly affects the life of tyres.

On this page we reproduce photographs of two more machines, one of which is (or was) a 9 h.p. Singer, and the other a Riley tricar. These may serve to suggest fresh ideas to anyone who intends to experiment in this direction.

MILITARY MOTOR CYCLING NOTES.

Another Mobilisation Scheme. A Cyclist Battalion for Birmingham.

By "CELERITER."

TO strike whilst the iron is hot is an old precept which has the advantage of being favoured by modern men of business, and put to the proof successfully. Those who know best consider that the frostiness of the usual War Office attitude towards military cycling has been brought to at least a degree of mild temperature by the recent splendid achievements at Daventry. It is claimed and admitted that we motor cyclists have proved our willingness and ability to rush off at a moment's notice to any indicated locality, but what the authorities now want to know is, "Are the motor cyclists capable of running to a scheduled time scheme?" and it is suggested that we should prove that we are imminently capable of so doing. The Legion of Cyclists has determined to prove it beyond a shadow of a doubt, and it invites all motor cyclists to co-operate. Unlike the Daventry mobilisation on April 27th, the date of the rendezvous is not to be kept a secret. Sunday, June 9th, at 1 p.m., is the appointed day and time, and the place will be within a forty miles radius of Charing Cross.

The Crux of the Scheme.

The whole idea is to prove that motor cyclists can run to schedule time over any given course, and the scheduled times on this particular occasion are to be as follows: For distances under 50 miles, 30 m.p.h.; 80 miles, 26 m.p.h.; 120 miles, 24 m.p.h.; 150 miles, 22 m.p.h.; over 150 miles, 20 m.p.h.

The ambition of each rider will be to arrive as the clock is striking 1 p.m. on Sunday, June 9th, at this unknown rendezvous, and there he will hand in his card to the officer on duty. The ideal is to attain absolute punctuality, and it will be just as bad to be five minutes early as to be five minutes late. The names of the twenty best arrivals, their mounts, and their score will be published in *The Motor Cycle* the following Thursday, and the representatives of the daily press will also be given all facilities to attend.

In addition, *The Motor Cycle* offers a prize of a silver cigarette case to the rider who makes the best record as adjudged by the umpire.

At 2.30 p.m. precisely the cards will be handed back to competitors, and they will then return home with all speed, get a witness to their time of arrival, and return their card by post to the umpire. The event, therefore, consists of a double one—a time test and a speed test.

How to Compete.

Address a stamped postcard to yourself, and then write in on the back the following particulars:

The rendezvous is the Railway Station at .....
Approximate number of miles .....
Hour of start .....
Witness to start .....
Address .....
Make and h.p. of machine .....
Hour of arrival at rendezvous .....p.m.
Hour of return home .....
Witness to return .....
Address .....

You should then enclose this postcard, together with three penny stamps, to Capt. A. H. Trapmann, 117, Piccadilly, W., so as to reach that address *not later* than first post Friday, June 7th. The postcard will reach you on Saturday with the rendezvous filled in and the other details will be filled in by you, the witness, or the umpire. Although it is hoped that the majority of those who take part will join the Legion of Cyclists, this is by no means obligatory.

The Legion of Cyclists.

Whilst on this subject, it will interest all of our readers who happen to be members of the Legion to know that at the conference held on May 4th the following points were decided:

(1) That each corps should pay an affiliation fee of 5s. per annum.

(2) That uniform should be optional, but that no corps should adopt a uniform without sanction from headquarters.

(3) That individual members should be allowed to purchase Legion badges provided that their application was forwarded through an organising officer.

(4) That all members should be encouraged to become subscribers to the Legion official magazine, which is to make its first appearance next month. (Subscription, post free, 3s. per annum, orders to be sent to the Editor, 128, Jermyn Street, London, W.).

(5) That until the Army Council are prepared to consider the claims of the Legion for official recognition every effort should be made to impress these claims upon them.

A Cyclist Battalion for Birmingham.

It will be good news for Birmingham, Coventry, and the Midlands that the War Office has invited that district to provide a Cyclist Battalion. It has been the cry and the desire of Birmingham cyclists for many a long month—or shall I say year?—and now at last it has been granted. The offer has gone forth, and it remains to be seen whether the Warwickshire County Association will accept it. On this point there cannot be much doubt, and also there is no doubt whatever that within a very few weeks the new battalion will recruit up to full strength, for there are hundreds of cyclists and motor cyclists round about Birmingham anxious and willing to serve their country. It is not often that a weekly journal can boast of being ahead of the daily press in the matter of news, but this is the first announcement that has appeared in print of the offer made by the War Office. Those motor cyclists and cyclists who are desirous of joining the new battalion should communicate with Colonel W. R. Ludlow, C.B., V.D., or Captain J. N. Townsend, both of the 8th Battalion Warwickshire Regiment, Aston Manor, Birmingham, who are interested in the formation of the new Cyclist Midland Regiment.

Legion of Cyclists Gazette.

The following corps having attained full strength and applied for recognition, are gazetted accordingly: 1st Corps (Woolwich), date April 20th, 1912; 2nd Corps (Brighton), date May 3rd, 1912; 3rd Corps (Chertsey), date May 5th, 1912.

Readers who desire information or advice upon military matters are invited to write to 'Celeriter," c/o the Editor "The Motor Cycle."

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Hingham (Norfolk) to Malvern.

I should be much obliged if you would inform me—(1.) The best and shortest route from Hingham (Norfolk) to Malvern (Worcester). (2.) The total distance.

(1.) Your best route would be as follows: Hingham, Watton, Brandon, Mildenhall, Newmarket, Cambridge, St. Neots, Bedford, Stony Stratford, Buckingham, Aynho, Deddington, Chipping Norton, Stow-on-the-Wold, Tewkesbury, Upton, to Malvern. (2.) The distance is approximately 180 miles.

Cylinder Discoloured.

Having to remove my cylinder last week I found that there was a thin coating of burnt oil on the wall of cylinder extending 2½ inches, right under the exhaust pocket. It is the full width of exhaust pocket at the top and tapers off to a point down the cylinder. I should be glad to know the reason of this.—A. H.

The fact that the cylinder has become discoloured shows that it is not truly cylindrical, and it should be re-ground and a new piston fitted.

3½ h.p. and Sidecar.

(1.) Is the Arno machine thoroughly reliable? (2.) Is the Armstrong three-speed reliable, or would you recommend a two-speed gear in preference? (3.) Would a 3½ h.p. machine, fitted with a two or three-speed gear, and sidecar, be capable of taking two persons of average weights up Netherhall Gardens? (4.) What would be about the mileage of the back tyre? (5.) Would a leather belt (Service) last a thousand miles? (6.) What would be about the petrol consumption? (7.) Would the machine be capable of taking two people, say, to Bournemouth without dismounting (total weight about twenty stones)?—F. M. R.

(1.) The machine you mention is reliable. (2.) The gear in question is thoroughly to be recommended; it is better than a two-speed gear. (3.) Netherhall Gardens would be just about the limit for a 3½ h.p. single-cylinder. (4.) Standard cover about 2,000. (5.) Yes. (6.) Seventy to eighty miles to the gallon. (7.) The machine should certainly take you to Bournemouth without dismounting. You must, however, bear in mind that a 3½ h.p. does not allow very much reserve of power for sidecar work.

Lanark to Gravesend.

At Whitsuntide I am likely to be in Scotland, and intend riding from Lanark to Gravesend. Could you kindly advise me as to which is the best route, going through the Lake District? I shall also be glad if you can tell me how I could conveniently avoid going through London.—R. J. C. S.

Your best route would be as follows: Lanark, Symington, Abington Inn, Beattock, Lockerbie, Gretna Green, Carlisle, Bothel, Keswick, Ambleside, Windermere, Kendal, Lancaster, Garstang, Preston, Rufford, Ormskirk, Rainford, Rainhill, Widnes, by the Transporter Bridge to Runcorn, then through Northwich, Congleton, Leek, Ashbourne, Derby, Loughborough, Melton Mowbray, Oakham, Stamford, Wansford, Stilton, Huntingdon, Godmanchester, Cambridge, Chesterford, Saffron Walden, Dunmow, Chelmsford, Billericay, Tilbury, by ferry to Gravesend. It is a fairly good road all through. The distance is about 400 miles. This route is the best avoiding London.

Wear of Tyres.

Since fitting a leather belt (Whittle) to my 3½ h.p. motor cycle I find a rubber studded back tyre does not last me for more than about 500 miles, solo riding. I have been advised by one friend to use a Lomax band, and by another a "Duco" steel studded tyre, but I really want a tyre that will last. Will the ordinary motor cycle licence cover the keeping and driving of a motor cycle and ordinary push cycle coupled together, thus making a four-wheel machine?—E. J. J.

We regret that we are unable to advise any particular tyres. Both the makes mentioned have a good name. We would advise you to make certain your wheels are in track, as we have used the combination of Whittle belt and rubber studded tyre with very good mileage results for both. The addition of a push cycle coupled to a motor cycle converts the machine to a four-wheeler, or, under the present law, a car. A car licence is, therefore, necessary.

JACK SCRIVEN, ONE OF YORKSHIRE'S BEST KNOWN RIDERS.

Until his illness, Jack Scriven, of Bradford, was well nigh invincible on a motor cycle in the North. After a spell of car driving, he has returned to his first love—the motor cycle—his selection being a 1912 Scott, on which he was seen for the first time at the Leeds M.C.C. Beulah hill-climb. He is depicted chatting with Messrs. Wheater and Whittle, prominent members of the Leeds club.

Langley (Bucks.) to Helston (Cornwall).

I should be glad if you would mention the best road to Helston, Cornwall, for 8 h.p. and sidecar. —A.W.S.

Your best route would be as follows: Slough, Windsor, Egham, then take the main Exeter Road through Basingstoke, Andover, Salisbury, Wilton, Shaftesbury, Yeovil, Chard, Honiton, Exeter, Crediton, Okehampton, Launceston, Bodmin, Fraddon, Ladock, Truro, to Helston. The road through Truro is better than that through Redruth. From Fraddon to Truro *via* Ladock (not Mitchell) is one of the best roads in Cornwall or any other county.

Fitting Springs to Back Wheel.

(1.) What objection is there, if any, to springing the rear members of the Triumph after the manner of the N.S.U.? The Triumph frame is hinged near the bottom bracket, and perhaps the firm's own front fork spring and buttress could be adapted. Does any other firm supply spring attachments for Triumph? (2.) Which will last the longer, steel studs or rubber studs doing the same work and of the same size? (3.) Do you recommend the Lomax band for tyre economy? (4.) Is it detrimental to the engine to use paraffin and petrol mixed. I seem to get more power, and starting is unaffected.—L.M.B.

(1.) We do not know if there is any real objection to carrying out the modifications suggested except that it is rather a pity to try experiments with so fine a machine. You could use a spring seat-pillar fitted with steel or air springs, of which several are marketed. (2.) Probably the rubber studded tyre. (3.) We can recommend the band in question. (4.) No, provided you do not use too much paraffin there is no harm.

Care of a Clutch.

My machine is a free-engine Triumph, and in starting the clutch continues to slip for a time after I have removed my foot from the pedal. There is no sign of slipping when once the clutch is in, even on the stiffest hills. (1.) Can this be due to worn plates, or is it caused by the lubrication being too thick? If the latter, would the injection of a little paraffin put matters right? (2.) How would the injection of paraffin affect the wheel bearings? (3.) In what position should the spark be when starting by the clutch? (4.) Can this particular clutch be successfully slipped in traffic without danger of ruining it? (5.) Is the ordinary lubrication of the back wheel axle also sufficient for the needs of the clutch?—A.P.

(1.) If you put a little thin oil into the clutch we think it will cure the trouble. After all, it does not appear to be very serious. (2.) If you take our advice there will be no need to put any paraffin in the wheel bearings. It would do no harm, provided that they are properly oiled afterwards. (3.) The spark should be nearly fully advanced. (4.) The clutch will stand a good deal of slipping, but, of course, this should not be overdone. (5.) The Triumph Co.'s handbook will give you full information regarding lubricating the clutch.

Registration and Licence for A.C. Tricar.

Can you tell me where I can register an A.C. tricar as cycle, so that I may use it under the motor cycle £1 tax? The local authorities in my district will only register as car and want the car licence of £2 2s.—G.E.T.

We are afraid it is impossible at the present time to register an A.C. tricar as a motor cycle. The authorities now know a good deal more about certain motor cycles than they did a few years ago, and they all know that this machine is well over the 3 cwt. limit. The fact that the machine has not more than three wheels renders it eligible for the £1 local taxation licence, but it must be registered as a car. If the authorities in your district refuse the £1 local taxation licence they are clearly in the wrong, and we should recommend you to place the matter before the legal department of whatever motoring organisation you belong to.

Setting Plug Points.

My machine is a 1908 twin Rex de Luxe, and runs perfectly on the level at 20 to 25 m.p.h., but when I want to go faster or to climb hills I cannot get a suitable mixture to fire. What I want to know is: (1.) Should the magneto platinum points be set very fine to fire a stronger mixture with plug points as close as possible without touching, or can you give me a better setting? (2.) Do you think I should get much better results from a 1912 B. and B. carburetter in the place of the one supplied with machine?—T.H.C.

Do not have the platinum points separating very wide, but you may overdo close setting as regards the sparking plug points. You had better try the points until you find which is the best gap. You may get misfiring at slow speeds if the gap is too small. You will get better results from a modern carburetter, when properly adjusted to the engine.

READER'S REPLY.

Oiling an Engine-shaft Gear.

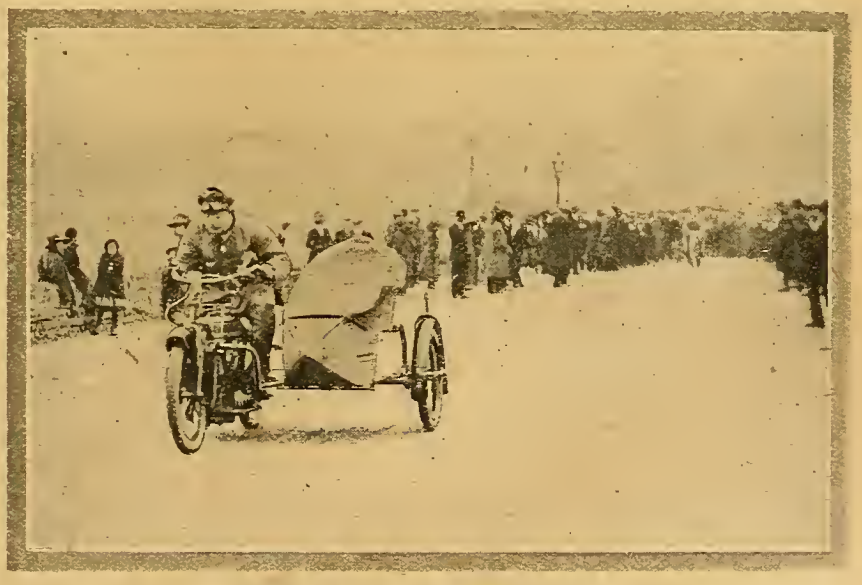
With reference to the query, "Oiling an engine-shaft gear," in the issue of the 2nd inst., the writer need have no anxiety on the point of whether the gear is getting oil, so long as he can see oil coming through the square opening on the outer side of the gear, into which the tool provided for the purpose of adjusting the gear fits, assuming, that is, that the machine is also a N.S.U., the explanation being that the shaft is hollow with the express purpose of allowing the oil pumped to the engine getting through to the gear. I rode my N.S.U., bought in August, 1909, over 8,000 miles before parting with it, and never once oiled the gear. On the other hand, if the machine is not of the same make as the gear, it is then, of course, necessary to inject oil, as you state in your answer. In the new models of this gear a long screw has been fitted by the makers to stop the oil coming out at this opening; to inject oil, this screw has to be removed by means of a thin screwdriver and oil injected with a "gun." I use Price's lubricant jelly, which must first be heated.—A.P.S.

NOTE TO QUERISTS.

If "B.F.H." (London), "J.McN." (Ballymena), "AD 2075" (Acock's Green), and "A.J.W." (Swindon) will comply with our rules and forward stamped addressed envelopes we shall be pleased to forward replies to their queries.

EXPERIENCES WANTED.

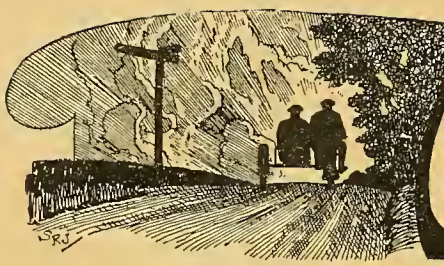
"E.K.R." (Manchester).—A.C. tricar.



"S.L." (Maidstone).—3½ h.p. T.T. Rudge.

"A.F." (St. Helens).—Jones petrol atomiser.

"C.E.R.B." (Oxford).—6 h.p. Royal Enfield with sidecar.



"R.D.C.D." (Punjab).—3½ h.p. Triumph, two or three-speed, with sidecar, in hilly country such as Devonshire.

"Rector" (London).—J.A.P. or other automatic carburetter on 3½ h.p. Bradbury and sidecar.

HANDICAP HILL-CLIMB AT BEULAH HILL.

J. Bateson (8 h.p. Chater-Lea sidecar) leads from Wilkinson (6 h.p. Matchless) in the Leeds M.C.C. contest, but is eventually overtaken higher up the hill.

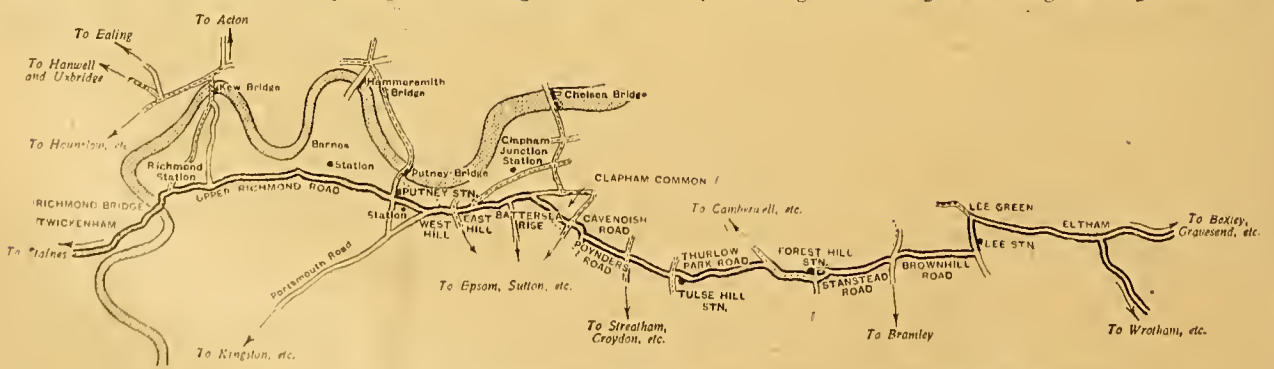
Traffic Dodging Routes Across London.

On March 14th we published a map, issued by the R.A.C., giving a circular route round London which should be useful to those who wish to avoid the Metropolis itself when riding to places beyond. The following article and maps will show the more desirable routes to take when passing through the suburbs, and should be especially useful to those who reside in the suburbs or in London itself.

AS enquiries are frequently made by riders living on the outskirts of London who wish to get across and escape the traffic, especially tramcars, as far as possible, the following routes may be useful to many. Street names are given as far as possible to allow of the routes being followed on any large scale map. The greater density of traffic in the north and east makes it inevitable for both routes to pass south and west of the central districts.

Route A. West to East.

Bearing in mind the great extension of London in a westerly direction, and the fact that the typical western road, the Bath Road, leads infallibly to Brentford, the starting point will be fixed some distance out, namely, at Staines. This is a centre easily reached from Reading, Windsor, Bagshot, etc. In the main street turn right as directed by the sign-post for Sunbury and Kingston. This road may be followed past Hampton Court and through Kingston, then joining the Portsmouth Road and proceeding over Wimbledon Common to Wandsworth. It is better, however, to turn left at Sunbury Station (four miles from Staines) for Twickenham, continuing straight on with the tramlines to Richmond Bridge, where the trams cease. Shortly before reaching the bridge, and right through Richmond, a ten-mile limit is imposed. After the short rise from the bridge, turn to the left down the slope—many maps wrongly show it proceeding straight on—then to the right at the bottom (George Street), and take the right-hand road at the fork which follows. The Upper Richmond Road is soon reached, which provides a delightful run over well-laid wood paving with scarcely a break for four miles, of which, however, the first portion is occasionally trapped. A double bend at Hogger's Corner and the crossing at Putney High Street require care. After passing East Putney Station, the alternative route *viâ* Kingston is joined.



Continuing on through Wandsworth, cross over the tramlines at Garratt Lane, and ascend East Hill, which should give no trouble. Take the right-hand side of the building which faces you at the top, thus avoiding the trams which run to the left, and proceed along past Wandsworth Common and across the railway. The road (Battersea Rise) now dips to an awkward crossing, and rises again to Clapham Common. Here turn right immediately, and proceed along a road, occasionally somewhat bumpy, which crosses the common near this edge. On the right a narrow strip forms a tennis ground. Just before leaving the common take the left-hand fork, and cross straight over the tramlines (Clapham Road) to Cavendish Road. Follow this road as it bends to the right, and then immediately turn to the left along the wide Poynder's Road, which, continuing as Queen's Road and Streatham Place, leads to the Streatham Road. Again cross straight over to Christchurch Road, which terminates at Norwood Road.

Here turn to the left for a few yards to clear Tulse Hill Station before turning to the right along Thurlow Park Road and on through Dulwich Common Lane to Lordship Lane. From this point follow the trams to Forest Hill Station, to which the road drops after a steady climb up London Road. Cross the railway and turn to the left along Stanstead Road, which soon resumes your original direction by bending to the right, and leads past Catford Station to Rushey Green (Bromley Road). Again turn to the left for a few yards and then to the right along Brownhill Road to Burntash Road, where a further sharp left-hand turn leads past Lee Station to Lee Green. Turning to the right, there is a clean run through Eltham to Maidstone, or *viâ* Bexley and Crayford, the Canterbury Road can be joined, Blackheath and Shooter's Hill having been avoided.

The Chief Feeders.

In dealing with the chief feeders, it may be assumed that riders starting from districts south and east of Kingston will follow a wider sweep than the road given. Kingston itself has been already mentioned. From Hounslow the road to Richmond is very difficult to follow, so that through Brentford to Kew Bridge seems the only course. From Hanwell, Ealing, and Acton, Kew Bridge is also easily reached. Cross the bridge, and for simplicity, follow the horse tram tracks to Richmond, where, after passing the railway station, turn to the left at the fire station into the continuation (Sheen Road) of the Upper Richmond Road. A shorter route is to turn left at the far side of Kew Green, and taking the first on the right (Sandycombe Road) cross the railway at the gasworks, taking the right-hand side of the gasometer (sign-post directs to Richmond Hill), and then joining the Upper Richmond Road at the Black Horse.

From Willesden and Harlesden there is a fairly quiet tram road to Hammersmith, where the Broadway has to be negotiated. At the present time this crossing is undergoing improvements It is then best to follow Fulham Palace Road over Putney Bridge and along the High Street. The

Route A, crossing London from West to East, avoiding most tram routes and thick traffic. The tram lines are denoted by dotted lines.

Traffic Dodging Routes Across London.—

route is joined at Putney Station, where turn left.

From districts lying north and east of these, if Route B below be followed to join the other at Clapham Common, this comparatively slight detour will enable all the worst of the central traffic to be avoided.

Route B. North to South.

In traversing London from North to South, it has been found somewhat difficult to choose the best road. Although the route given comes as near the centre of London as the Marble Arch, yet it has the great advantage of simplicity on the northern side. The recent improvements, moreover, at the Marble Arch have robbed this crossing of much of its difficulty. On the southern side, it has not been found possible to avoid trams to the same extent as on the other cross route, but those encountered are mostly newly laid on wood-paved roads, and there are very few points of difficulty.

Starting from Barnet, then, to ride across to the Brighton Road, follow the North Road to Friern Barnet, where, instead of continuing on to Highgate, take the right-hand road to Golder's Green and Child's Hill. Just after passing the tram terminus, when the road shows signs of dropping, bear right at a horse-trough, but do not turn sharply. The road bends to the left, falling rather sharply at first, and leads into West End Lane, which is followed through some variations of surface and width until it ends at the Edgware Road. At one junction the correct road is not obvious, but the name is prominently posted on the wall. The termination in the Edgware Road is rather narrow, and its position should be carefully noted with a view to the return journey. Bank premises stand at one corner, and, turning left and proceeding south along the Edgware Road, Kilburn Station is reached.

Southwards from the Marble Arch.

Now follow the Edgware Road to Marble Arch. It is a fine wide road, with very little slow traffic to cause obstruction, and none but an absolute novice need fear it. Pass across the Park to Hyde Park Corner, and proceed straight over along Grosvenor Place, keeping the wall of Buckingham Palace grounds on the left, and turn to the right along the front of Grosvenor Hotel (Victoria). Continue as straight as possible by steering round a refuge, and immediately turning to the left (Commercial Road). When further progress is barred, turn to the left over Chelsea Bridge, and follow the trams along Queen's Road, crossing other tracks in Battersea Park Road, and then Wandsworth Road, until Clapham Common is reached. On the opposite side of the Common lies the direct Epsom Road, which can be reached at once by circling round the eastern end. It is advisable, however, to make a detour by turning to the right along the north side. The first turning to the left across the Common leads direct into the Brighton Road *viâ* Cavendish Road, etc., as in Route A.

Continuing along the north side, drop down Battersea Rise and climb the other side—quite a gentle slope—until near the top a cemetery is seen, where turn left along Bolingbroke Grove, which runs beside a common similarly named. At the end of the common bear to the right across the railway, turning to the left at the foot of the bridge. (St. James's Road, leading to Trinity Road.) For Streatham and Croydon cross over the main road along Tooting Bec Road, and at the end of it make left and right round a fountain. For Epsom, Horsham, etc., turn to the right instead of crossing over. For Mitcham, Sutton, and Reigate also turn to the right as far as

Route B, crossing London from North to South.

the misnamed Tooting Broadway (tramway crossing), and then turn to the left.

This is also the commencement of a useful by-pass which avoids Croydon and joins the Brighton Road at its junction with the Eastbourne Road at Purley. At the clock-tower at Mitcham Green, soon after entering the ten-mile limit, bear to the left, and after crossing the first railway bridge turn left again. Now take the first road on the right, which passes the railway at a level crossing and continues in unmistakable fashion past Beddington to Purley Station, just at the tram terminus. At the only point where doubt might arise a sign-post points to the right fork as the road to Purley, which is finally reached by a steep drop down Plough Lane, which appears as the right hand road of a fork on the return journey after having turned left out of the Brighton Road. This road through Beddington is to be preferred to the parallel one through Wallington, which comes out farther south still.

The chief off-shoot from the main route is to join the Portsmouth Road, and is as follows: Proceeding down Grosvenor Place from Hyde Park Corner, watch the wall of Buckingham Palace on the left. When it terminates at a side road turn right directly opposite, and continue as straight as possible past Sloane Square and along King's Road, turning to the left when the tramlines are met to cross Putney Bridge. Continue straight on up the hill, turning to the right on reaching the Heath and proceeding *via* Kingston, etc.

How to Join the Route.

To join the route on the northern side make for the Edgware Road, or for Hammersmith and Putney, as indicated under Route A. To avoid trams from Hammersmith to the Portsmouth Road cross the bridge, and at the end of the broad Castelnau turn left for Barnes Station. Cross the Upper Richmond Road and follow Roehampton Lane until the Portsmouth Road is joined at the top of the hill. For the Brighton Road or the Epsom Road turn left at Putney Station along the Upper Richmond Road as far as Wandsworth, and then turn to the right along the tram track (Garratt Lane) to Tooting Broadway. Here join the Epsom Road or proceed to the Brighton Road *via* Mitcham.

From Cheshunt, Waltham Cross, Enfield, etc., riders may either strike across country to the North Road or tackle the Seven Sisters Road and Camden Road from South Tottenham, circling Regent's Park and passing Lord's cricket ground before joining the Edgware Road. R.J.T.

A CYCLOMETER TRANSMISSION.

Mr. C. C. Hawkins, C.I.E., Bridgemary, Fareham, Hants, sends us particulars of a device he has patented for driving an ordinary cyclometer on the handle-bar. The device consists of a bracket clipped to the handle-bar, which will take a Veeder or Lucas cyclometer. On the bracket is a bearing, in which runs a small flexible shaft, ending in a prong coupling, which engages the star wheel on the cyclometer. At the other end of the flexible shaft is another bracket for attaching to the front wheel spindle. This bracket also carries a bearing for the end of the flexible shaft, and on the extremity of the latter is a star wheel similar to the one on a cyclometer, and which takes the drive from the small roller fixed to the spokes of the front wheel. The cyclometer is always under the rider's eye and is away from dust and mud. The inventor informs us that he has had one of these cyclometer drives in use for a long time and has found it to work perfectly.

THE PUCH SIDECAR.

AN ORIGINAL DESIGN WITH SEVERAL NEW POINTS.

INASMUCH as the sidecar is a thoroughly British production, which only within the last few months has shown any signs of gaining favour in America and on the Continent, one would suppose that for some time to come home manufacturers will introduce new ideas in sidecar design. It is true that the sidecar has been improved very much, but except in point of body design and detail fittings not a great deal of change has taken place. Hence the new ideas which are contained in an Austrian design should not fail to be of interest.

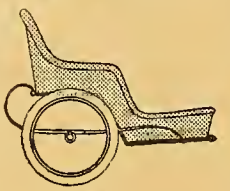


Fig. 1.

At first sight the Puch sidecar presents much the same appearance as any other, though it must be admitted that the shape of the body is not quite of the most modern type. As a matter of fact, however, its construction is quite different. In the ordinary design the "chair," or body, is slung both fore and aft upon S springs, which, in turn, are supported upon a rigid chassis. In some cases this chassis is itself sprung from the axle, but in the ordinary and most common type the frame is rigid. The principal individuality of the Puch design is that there is no rigid chassis at all. As shown in fig. 1, the chair springs, which are attached at the seat and the toe, are carried direct on the wheel axle, which is made of unusual strength, and is connected to the chain stay and back hub of the motor cycle in such a manner that it cannot possibly twist round. It is, as usual, further reinforced by a cranked diagonal tube leading from the saddle pillar clip to the stub end. The sidecar chair is made of wicker, underneath which is a light steel tubular framework, which follows its under contour and upon which it is built up. This framework is shown in bold lines in the sketch. From the

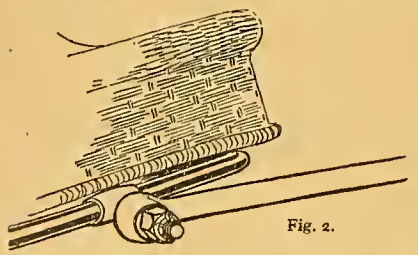

Fig. 2.

front end of it there proceeds a tubular cross-piece to the steering head of the motor cycle frame; this cross-piece acts as a coupling rod, and is jointed at each end as shown in figs. 2 and 3.

The Distribution of Weight.

The loose joints allow the "toe" of the sidecar to rock up and down quite freely under the action of the springs. At the same time they ensure that none of the passenger's weight comes upon the bicycle steering wheel, all of it being taken upon the sidecar axle.

The principal advantage of the system is that a general reduction of weight is effected, to say nothing of simplifying the whole design. The chair frame weighs, of course, very much less than the ordinary chassis. On the other hand, the system is open to some objection on the score that most of the tractive effort has to be transmitted through working joints, the wear upon which, and strain, may be somewhat excessive, and as a corollary to this the chain stays of the cycle frame may be liable to be strained. Certainly, however, there appeared to be no signs of wear or strain upon the model we have had the pleasure of inspecting, although it is quite clear that the combination has travelled a considerable distance. Another point that struck us as being open to objection was the fact that the sidecar joints are not particularly easy of detachment, as they are of the plain split-pinned nut and bolt variety.

Points for Designers.

The Puch sidecar, however, contains several points which deserve the attention of home designers, and undoubtedly

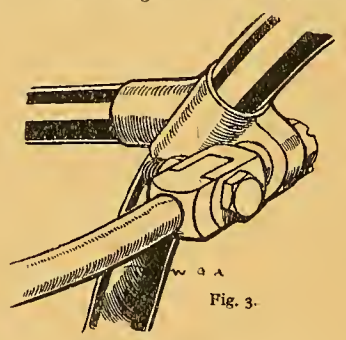

Fig. 3.

show that it has been produced by a practical man.

Point number one is that the sidecar joint lugs are made permanent attachments to the cycle frame. This, in our opinion, is far and away the best plan, as it prevents the tube being strained by careless handling with a big spanner, preserves enamel, and facilitates the initial setting and alignment.

Point number two. There is a spare petrol tank in addition to the unusually large capacity of the main one. It seems to us that there is little reason why such an eminently useful and simple attachment should not be made an integral part of every sidecar (see fig. 4). No one likes stopping for petrol, yet to carry a spare tin either inconveniences the foot room of the passenger or makes it necessary to kneel in the road when a roadside fill-up is wanted. Petrol cans are also not the last word in æstheticism. The Puch spare tank holds, we judge, about one and a half gallons—the weight of which is sprung—and is fitted with a pump connection nipple whereby the main tank can be quickly refilled through a rubber tube with no liability of wastage or danger from fire. Painted to match the rest of the machine, it is also not in the least unsightly.

Point number three consists in the fact that a very practical sprag is fitted, which is simplicity itself, and is just a fork-ended tube pivoted to the sidecar axle and normally held off the ground with a strap. Anyone who has used a sidecar in really hilly country will realise the value of this inexpensive fitting, not only in holding the machine up when it is stopped on a hill, but also

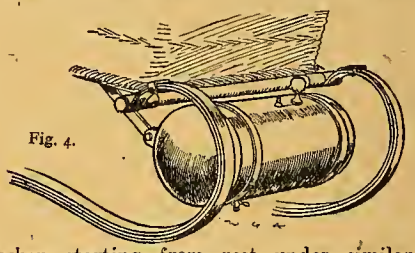

Fig. 4.

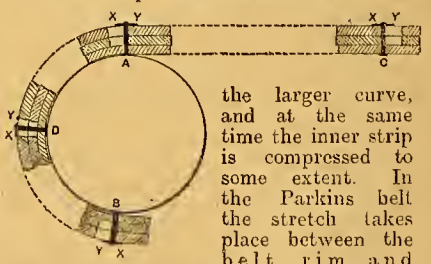
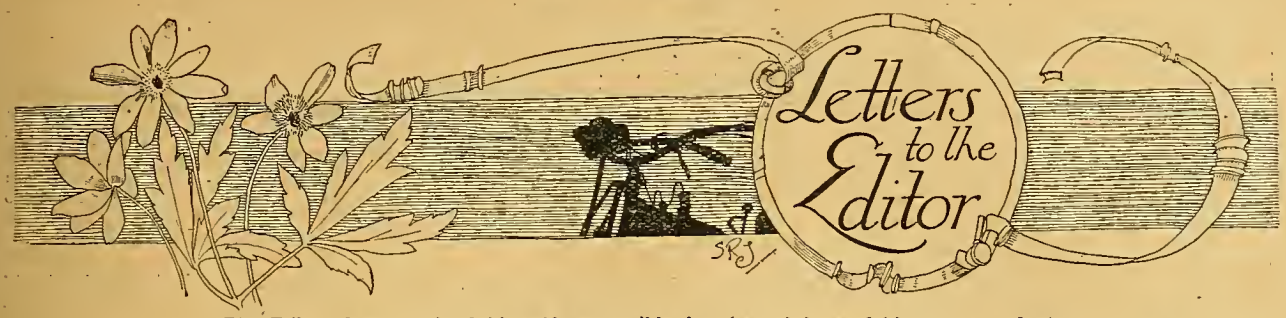
when starting from rest under similar circumstances. There is, furthermore, no reason that we can see why such a sprag should not upon occasion be made to serve the purpose of a stand, when repairing sidecar wheel punctures.



The fourth point is that the upholstery of the sidecar is carried out in really good glazed patent leather, which will stand any amount of wear and weather without looking in the least shabby. It does not scratch, nor does it tear, and can easily be cleaned up after a dusty run to look as glossy as when new. There is no doubt that its employment would add but little to the initial cost, and, in any case, the additional expense would be well justified.

Fifth point. A silencer of sensible dimensions is attached to the sidecar axle, and coupled by a long tube to a small exhaust pot near the engine.



The address of the Puch Motor Cycle and Car Agency is Ladbroke Road, Notting Hill, W.

THE PARKINS MOTOR CYCLE BELT.

The belt which we illustrate herewith is made on a new principle. When an ordinary leather belt bends over a pulley the outer strip has to stretch as it takes

the larger curve, and at the same time the inner strip is compressed to some extent. In the Parkins belt the stretch takes place between the belt rim and pulley, viz., on the straight portion of the belt instead of on the curved. This is brought about by the rivets moving in slots in the two outer strips. It will be noticed that at A, where this first contact of the pulley takes place, the point Y is next to the rivet. At D, the mid-position on the pulley, the rivet is half-way between X and Y, while at B and C, the last contacts with the pulley and belt rim, the rivet is close to X. This shows that the strips slide over one another as the belt moves round, and thus it is claimed make the belt more pliable than it would otherwise be.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street E.C., and should be accompanied by the writer's full name and address.

A Suggestion Regarding Competitions.

Sir,—As a keen motor cyclist, I write to suggest that some of the reliability trials and special events be held occasionally on another day in the week than Saturdays, say Thursdays. My business will not permit me leaving on a Saturday, and I am convinced there are thousands of business and professional men in the same position, who, if another day were fixed, would take the opportunity of taking part in or witnessing these special events.

ONE IN A THOUSAND.

Manufacturers' Resolution re Hill-climbs.

Sir,—I regret a mistake has been made in the wording of this resolution.

Will you please cancel my last communication, and accept the following amended matter:

Resolved: "That in future members of the Motor Cycle Section will not support either by entries or by contributions to prize funds any hill-climb or any reliability competition which includes 'timed' hill-climbs, unless the personal assurance of the promoters is given that the hill, in the case of a timed hill-climb, or timed hills, which may be selected in reliability trials, are free from dangerous corners or hair-pin bends." ALF. BEDNELL (Secretary),

The Cycle and Motor Cycle Manufacturers' and Traders' Union, Limited.

Washing Shower-proof Overalls.

Sir,—In answer to J. L. Hoffmann's query *re* the washing and proofing of overalls [page 494, May 2nd], they can be washed in the ordinary way. After washing, pass the garment through a warm soap bath, 1 lb. to the gallon. Leave in the soap bath for about half an hour so that the soap will penetrate; it should then be removed, wrung out, and passed into an alum solution—alum, 1 lb. to a gallon of water. After removal from the alum solution the garment should be again wrung out, passed once or twice through clean water, and then put through a mangle. The object is to get the cloth saturated with soap solution, so that the alumina soap is deposited in the fibres. It should be dried in the open air. When finished it will be quite waterproof.

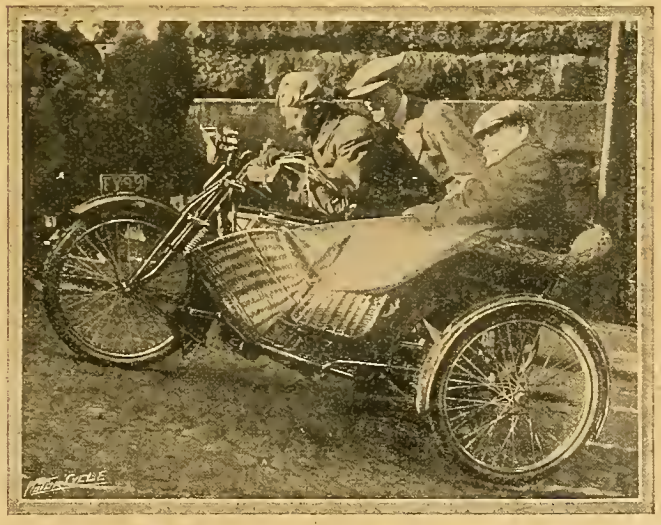
R. MASON.

Carburetter Design.

Sir,—*Re* your description of "A Simple Carburetter without a Float Chamber," page 458, issue April 25th. I do not know whether this is supposed to be a new idea for a carburetter, but I may say that my old Mitchell machine was fitted with a carburetter identical with that described by Mr. B. Cooper. I still have same in my possession, and would be pleased to submit it for your inspection. It must be about ten years old now, but still works well, though I had to give more air (about two years ago) by opening up the intake. I cannot understand this, as the carburetter worked all right up till that time, and then quite suddenly refused to supply enough air, and it still has the holes drilled to supply the needful. I find that, unless the needle valve is kept open only just sufficiently to supply enough petrol for the conditions, it is rather extravagant, but I run on just a minimum, and open the needle valve when required.

SEVEN YEARS' READER.

Sidecars and Modern Lightweights.



Sir,—It may interest some of your readers to hear the results of attaching a light sidecar to my 1911 model E Douglas.

I had not previously driven one until the 27th ult., but after a short spin without a passenger I found one sufficiently daring to trust herself in my hands. To my surprise the little twin made comparatively light of Highgate Hill on the low gear and took Barnet Hill on top, and continuing my trip to Hitchin I had only to use the low gear occasionally, and, but for a strong headwind, I think this would have been unnecessary. I might add that I have no interest other than that of a thoroughly satisfied user.

R. W. WEBB.

Dangers of Running Backwards on a Hill.

Sir,—I am the fortunate possessor of a Rudge Multi and No. 4 Gloria sidecar complete, which I have acquired for touring purposes. The total weight of combination, passengers, luggage, and tin of petrol is just over 5 cwts. With this weight my Rudge has taken White Horse Hill, Canterbury Road, at 32 m.p.h. This speaks volumes for engine power and the variable gear. There is, however, one danger always to be looked for on hill work with a combination; and that is belt breaking and the running backward of the machine. Of course prompt application of brakes may prevent this, with the prompter exit of the passenger; but promptness of the latter in a torpedo sidecar is not always possible. In order to obviate this *contretemps*, I have had a sprag fitted to the sidecar operated by a strap from the motor cycle. The sprag does not grip the ground rigidly on contact. It is bolted on the axle with a certain amount of revolving "give" thereon. The driver drops the sprag, at the same time slightly releasing foot brake pressure; allows the machine to move backward until he feels

Quite recently, Hugh Gibson (3½ h.p. two-speed Bradbury sidecar) climbed Arthur Street, Edinburgh, with three passengers whose combined weight was thirty-six stones. He also ascended the Mound with two passengers.

the sprag hold the ground. Rider and passenger can then dismount with ease. Experimental use of this sprag on a steep decline proves its efficacy, and I think sidecarists should consider the utility of the suggestion. I have communicated the idea to the makers of the Gloria sidecar, and recommend it to your readers. D 7580.

Unofficial Records.

Sir,—There seems little doubt that several attempts on long-distance records will be made during the coming summer, and it would surely be a wise move if a body were to be formed to hall-mark such performances. It may be urged that such a body would be acting illegally; but I cannot agree with this contention, since their supervision would not in any way prevent action being taken by the A.C.U. or the authorities. The time is not far distant when someone will beat the six days' record by one mile, or the End-to-end by five minutes. As things stand, it is necessary for the individual claimant to record honours to prove that he has been honest, and it speaks volumes for English sportsmanship that there has been no question of *bona-fides* up to date.

It is all very well to say that such attempts should not be permitted, but they never will be entirely suppressed so long as men wish to go one better than their predecessors, and therefore every effort should be made to check such rides. The A.C.U. could still drop heavily on to the malefactors, and would no doubt apply to the R.R.A. (Road Records Association), who would be bound to assist.

I have promised the A.C.U. that I will take no part in racing (?) on the road until June, 1913, and therefore have no interest in any proposed association, but I feel that something of the kind should be done before some dispute about time or distance arises. I. B. HART-DAVIES.

The Problem of the Automatic Carburetter.

Sir,—We seem to be hearing a lot about the automatic carburetter just now, and I should like to know what faults there are in the Fafnir carburetter and the means of control that that firm employs, namely, a variation of the lift of the inlet valve. This seems to me the right method—not to alter the quality of the charge, but the quantity sucked into the cylinder. J.G.B.

Sir,—I am particularly interested in the short article by "E.M.O." in your issue of May 2nd, and coming as it does from one who has evidently some experience of carburetters, it has some weight.

It is rather a coincidence that until a month ago I held practically the same views regarding automatic carburetters as "E.M.O.," and after studying the effects of results of various different makes of automatic carburetters, single and multiple jets, my mind was quite made up that the hand controlled carburetter was more satisfactory in the end, because it satisfied all the claims made on it by throttling, engine revolution, temperature, and density of spirit.

But just lately the Lukin carburetter has been brought before my notice and it seems to me that the vexed problem of carburation has been solved once and for all. I have personally tested almost every carburetter on the market, and no results are so satisfying as those given by the Lukin. More power and speed can be obtained than with the ordinary two lever carburetter. Dead slow running and "lightning" pick up acceleration are, perhaps, its strongest claims, where the throttle is closed a further movement of the lever allows the ports to open and cold air is drawn into the engine. This means cooling of the engine and a scavenging effect.

The Lukin principle is unlike any other, excepting that it has the ordinary float feed. The vaporisation of the mixture is proportioned "just right." Air is sucked in through the ports direct to the inlet valve, at the same time being impregnated with petrol vapour. The jet is fixed to the base of the carburetter. The petrol is sucked out of the two holes in the jet and passes through three holes in the spindle. It is obvious, therefore, that the vapour must be supplied in proportion to the port opening. This is effected by means of a second pair of plates above the jet in the top of the spindle. These provide three more ports which move simultaneously with the bottom ports, thereby increasing or decreasing the vacuum above the jet inside the spindle, and therefore the suction on the jet and the supply of vapour. At "full throttle" the top ports are dead shut, thereby causing maximum suction. As the spindle is revolved, closing the bottom ports, it proportionately opens the top ports, reducing the suction. Owing to the design of the ports the mixture is kept correct at all openings of the throttle. While I appreciate a good deal of what "E.M.O." writes, I think it is manifestly unfair to class the Lukin synchroniser among those modern "automatic" carburetters seemingly designed on the assumption that the engine speed varies always with the position of the throttle. It may be necessary to point out that I have no interest in the "Lukin device" beyond that it strongly appeals to me on scientific grounds.

W. GALLAWAY DUNCAN, M.I.M.E., M.I.A.E.

Sir,—I am flattered to think that my little article should have attracted the attention of such a well-known carburetter scientist as Mr. Charles Binks.

With regard to his first point, as to the petrol level, I contend that my statement is correct. Of course, my remark was meant more as a guide to those who use the standard two-lever carburetter, and I do not wish it to be taken as expressing a scientific dogma. The fact that an engine fitted with the Binks carburetter will go on running after the petrol tap is turned off has no bearing on the question at all. This virtue (if virtue it be) is not confined to the Binks carburetter. My Triumph runs for about 300 yards after the petrol tap is turned off, which distance would, I suppose, about empty the float chamber. It is one thing, however, for an engine to run with a low petrol level, and quite another thing for it to run well. I question very much whether Mr. Binks attaches as little importance as he pretends to the adjustment of the petrol level in the article he sells. Also, is it not one of the claims made for the Binks racing carburetter that when ascending a hill the jet at the end of the venturi tube gets an extra supply of fuel owing to the alteration in petrol level and increases speed?

With regard to my statement that on opening the extra air port, no more air is admitted to the cylinder, I cannot accept Mr. Binks's denial. While admitting that under abnormal conditions the volume may be increased, yet I maintain that in the main this is not so. I was correcting a rather prevalent notion that when the extra air lever is opened the flow of petrol remains constant, and the volume increased by the amount of the extra air admitted. This idea is incorrect, as I think Mr. Binks will admit.

As to the respective working limits of a car engine and a motor cycle engine, surely Mr. Binks does not seriously contend that a single-cylinder car engine works between such extreme limits as does a single-cylinder motor cycle? The presence of a gear box on every car shows the fallacy of this argument.

It is certainly a great achievement to have evolved a carburetter that will automatically give an explosive mixture at all speeds, but there is a great difference between an explosive mixture and a perfect mixture. E.M.O.

COVENTRY AND WARWICKSHIRE M.C. OPEN RELIABILITY TRIAL.
Climbing Saintbury Hill. V. Taylor (Rudge) is seen passing C. T. Newsome (Rover), whose belt jumped off the pulleys.

Sir,—One can hardly allow the egotism of Mr. C. Binks, as exemplified in your issue of May 9th, to pass unnoticed

I notice that he attacks your correspondent for stating "that petrol level must be kept close to the top of the jet in all carburetters with one exception," and proceeds to quote the smaller jet of a two jet carburetter.

His remarks may be true, but why do the manufacturers of these instruments take such pains to secure a constant petrol level for their instruments, and insist on this level being maintained by careful float adjustments?

In the truly automatic carburetters, constant petrol level is not essential, and, in addition to the Senspray, the makers of the Stewart-Precision and Brooke carburetters place the float bowl some inches below the top of the jet.

I seem to remember a short while ago that Mr. Binks claimed that his carburetter dribbled petrol through the jet (excluding any suction effect) when a cycle was hill-climbing. I will make no comment on this theory beyond remarking that cycles may happen to be left standing in an inclined position, and the dribble still takes place.

It is interesting to have the views of Mr. Binks on the resistance offered by a choke tube. The modern carburetter often works with an air velocity of nearly 300 feet per second, and if restriction occurs at ninety feet per second, I fail to see how Mr. Binks justifies the use of a choke tube.

I was personally of the opinion that the choke tube as understood by Mr. Binks was becoming obsolete, and it is interesting to note that in a recent classic article on carburetters by R. W. A. Brewer, a recognised authority on carburation, appearing in *The Automobile Engineer* for April, at least ten of the modern successful carburetters did not use choke tubes.

Regarding Mr. Binks's glorification of the two jet principle, I need only quote Mr. Brewer as follows:

"There is of necessity a certain amount of stopping up which is far more pronounced than in other types."

Again, two jet carburetters "have been somewhat difficult to adjust, and have not been well understood by the user."

I am a believer in the future of the automatic carburetter, but the cause is not furthered by letters of the type indicated.

F. N. PICKETT.

The Trade and the T.T.

Sir,—Unfortunately, few are aware that the letter which appeared in the last issue under the above heading is written under provocation by one who is apparently tasting "sour grapes," and who is one of a firm of motor cycle makers who make an ordinary touring machine for single and passenger work, which, in this category, we must admit has proved itself reliable, but to suggest for one moment that this type of machine would stand a ghost of a chance in the Tourist Trophy race is preposterous. Thus it goes that if a grumble is required we must go to those who feel helpless to compete. I say, without fear of contradiction, that no counter-shaft driven machine could hope to compete with the speed required of the T.T. if it is only of 3½ h.p. [We would refer our correspondent to the last T.T. Race, in which a Scott machine with counter-shaft two-speed gear accomplished the fastest lap.—ED.]

I trust, sir, you will find space to include this letter in your next issue in the interest of the sporting trade generally.

ONE OF THEM.

Sir,—The manufactures who have actual experience of the T.T. race will learn with interest from your correspondent, Mr. Marians, that, by their participation in this sporting event, they have sustained a "loss which can hardly be over-estimated," and that the race has meant "dislocation of system"—"special models, many weeks testing by the firm's most highly skilled riders and testers, the establishment of depots, and a huge stock of parts" in the island.

It would be more convincing, and certainly most interesting to your readers, if those manufacturers who have signed the bond gave us a detailed list of "that huge stock of spare parts" required for their racing machines.

A. A. SCOTT.

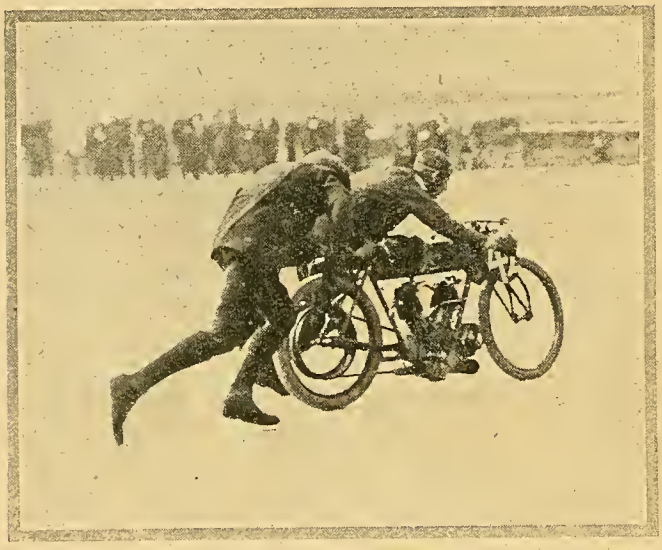
Disqualifications at Leathley Bank.

Sir,—"Iveona" requests some information on the above. In Class 3, for standard single-cylinders, the judge disqualified Mr. Newman (previous to him competing, mind you) because the machine was not, in the judge's opinion, a standard model, and according to Mr. Newman's letter the judge was correct, for does not Mr. Newman say, "I now wish to state that the engine was a standard competition Ivy-Precision engine"? He himself uses the word "competition" in describing his engine.

In Class 7, for any single-cylinder machine, Mr. Newman was disqualified for touching the ground with his feet contrary to Rule E, which reads as follows: "No pedalling will be allowed; neither may competitors place the foot or feet on the ground *under any consideration*."

Coming now to the statement, absurd by itself, but far more absurd when made by a rider of Mr. Newman's calibre, "that no ordinary touring engine could climb the hill in the time that I took, etc." Mr. Newman knows very well that in Class 3 I myself informed him he had been disqualified, and this previous to the class being run. After some talk with him over the matter I interviewed the judge, who eventually agreed to allow all competitors, whether disqualified or not, to run, and should any of them desire to object, then on the chance of their objection being upheld, the officials would be in possession of their times, etc. This decision of the judge was shouted out to the competitors before the start of Class 3. And, by the by, Mr. Newman did not object.

In Classes 1, 2, and 4, Mr. Newman was not disqualified, and as he only ran in two other classes, viz., 3 and 7, both of which I have fully dealt with, I trust the matter will now be satisfactory to the majority of your readers, including "Iveona."



H. W. FORTUNE,
Hon. Sec. for the Leathley Hill climb.

Harrogate and District M.C.C. Handicap Speed Trials. W. Faweett (6 h.p. Zenith), after passing T. C. Atkinson (2¾ h.p. New Hudson) in the final. (See Club News pages).

B.M.C.R.C. MAY MEETING.

OWING perhaps to the clashing of other week-end events, many well-known names were absent from the B.M.C.R.C.'s programme at Brooklands on Saturday last, and possibly for the same reason the spectators in point of numbers did not come up to the usual standard. The time trials, which were conducted

C. R. Collier (8 h.p. Matchless-Jap), winner of the 1,000 c.c. race, starting.

on a part of the track almost invisible from the Fork, provided no very great excitement. Saturday was well-nigh ideal for time trials conducted down the railway straight, as there was a strong wind behind the competitors, and no one was surprised, therefore, to learn that records had been broken. The following are the flying mile and the flying kilometre results :

CLASS A.—Up to 275 c.c.

Rider and machine.	Kilom. Secs.	M.P.H.	Mile. Secs.	M.P.H.
H. Martin (1 Martin-Jap) ...	37.8	=59.18	59.8	=60.2

CLASS B.—Up to 350 c.c.

G. E. Stanley (1 Singer) ...	35.	=63.91	57.	=63.16
W. Hodgkinson (1 Caeco) ...	46.4	=48.2	75.4	=47.75

CLASS C.—Up to 500 c.c.

*G. E. Stanley (1 Singer) ...	29.65	=75.45	49.30	=73.02
W. H. Elce (1 Rudge) ...	31.8	=70.34	52.4	=68.7
S. R. Axford (2 Martin-Jap)	31.2	=71.7	52.2	=68.97
W. L. T. Rhys (1 Triumph) ...	34.	=65.79	56.	=64.29

*New record. Previous best: Km. 30.2os.; mile, 49.39s.

CLASS D.—Up to 750 c.c.

*H. Hunter (2 Corah-Jap) ...	28.75	=77.8	47.34	=76.04
*R. L. Printz (2 Bat-Jap) ...	29.28	=76.3	48.26	=74.6
C. R. Collier (2 Matchless-Jap)	30.8	=72.63	50.8	=70.87
A. J. Luce (2 Bat-Jap) ...	32.	=69.9	52.8	=68.18

*New record. Previous best: Km 29.78s.; mile, 48.76s.

CLASS E.—Up to 1,000 c.c.

C. R. Collier (2 Matchless-Jap)	26.2	=85.38	43.8	=82.19

CLASS E, with sidecar.—Up to 1,000 c.c.

*G. F. Hunter (2 Zenith-Gradua)	31.	=72.15	55.6	=64.75

*New record. Previous best: Km., 37.47s.; mile, 60.99s.

Printz improved on the previous best in Class D, but did not set up new figures, as Hunter had gone before him. G. F. Hunter also set up a new record in the sidecar class, and his figures for the kilometre are certainly extraordinary. They will, we imagine, stand for some little time. The successful Corah was provided with quite a new type of J.A.P. engine, which had been specially built for this rider, though its design conforms throughout to the usual overhead J.A.P. lines.

Car Challenge Race.

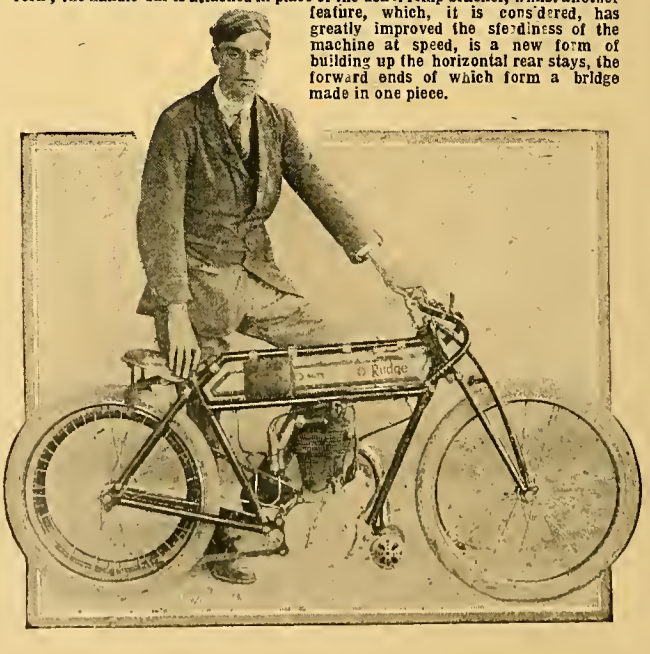
The second event was the 500 c.c. car challenge race, over a distance of three laps (8 miles 269 yards). The winners of the first and second prizes qualify for an invitation race with a selected motor car at the June Brooklands meeting.

G. E. Stanley took the lead from the start and was never seriously challenged, although Stanhope Spencer was hard on his heels at the end of the first lap. The gap between the two riders, however, slowly increased, and Stanley crossed the line 200 yards in front of Spencer, the third place being taken by Ayres, who managed to overhaul Elce in the last lap. There was a good quarter-mile between second and third. Winner's speed, 65.93 m.p.h. :

Rider and machine.	mm.	c.c.
1. G. E. Stanley (Singer)	85 × 88 ...	499
2. W. Stanhope Spencer (Rudge) ...	85 × 88 ...	499
3. N. A. Ayres (Singer)	85 × 88 ...	499
4. W. H. Elce (Rudge)	85 × 88 ...	499

Stanley's standing lap in the above race was actually done in 2m. 36s., or 62.71 m.p.h. a remarkable performance.

Cyclecar Handicap.



The third event the second five lap cyclecar handicap, distance 13 miles 1,035 yards, resulted as follows :

	mm.	c.c.	hd'cap.
1. J. T. Wood (2 G.W.K.) ...	86 × 92 ...	1,070 ...	3 0
2. F. Hill (1 A.C.)	95 × 102 ...	723 ...	3 20
3. H. Martin (2 Morgan-Jap)	90 × 77.5 ...	990 ...	scr.

Ward's Bedelia showed some disinclination to start, but when once the engine was turning got away very well. Its time allowance, however, enabled it nearly to complete a lap before the A.C. and the G.W.K. got away, which the former did in magnificent style, shooting off the mark like a stone from a catapult. Immediately it was under way the driver tucked himself down, and, except for a tuft of hair, disappeared until the end of the race. Martin also gave a good exhibition of how to get off, but in this he was helped by two stalwart pushers. Starters were not barred in the regulations for this event, but we think that in future it would be better that they should be. The A.C. and the G.W.K. were remarkably evenly matched, and lap after lap were covered with very little between them. The Bedelia after holding a

THE SINGLE CYLINDER HOUR RECORD HOLDER.

A new Rudge racer has been built for W. Stanhope Spencer. The front forks, as will be seen from the illustration, have been reversed, giving a splendid rigid fork; the handle-bar is attached in place of the usual lamp bracket, whilst another feature, which, it is considered, has greatly improved the steadiness of the machine at speed, is a new form of building up the horizontal rear stays, the forward ends of which form a bridge made in one piece.

B.M.C.R.C. May Meeting.—

rapidly decreasing lead for three laps came to a stop at some remote part of the track. Neither the Autotrix, which was the only machine carrying a passenger, nor the Morgan appeared to be going at its best. The latter passed the former at the end of two laps, and in the fourth lap lay third to the A.C. and the G.W.K. In the fifth lap the two leaders changed places, the G.W.K., which was certainly travelling very well, got to the front and won an exciting race by a matter of twenty yards, or one second, the Morgan being a long way behind. The winner's speed was 47.2 m.p.h.

The 750 c.c. Car Challenge Race.

This race immediately resolved itself into a procession, with Harry Collier in front, Printz second, and Hunter

The A.C. and G.W.K. (winner), starting in the 5-lap Cycle Car Race. C. M. Keiller on the G.W.K. was the ultimate winner.

third. This order was maintained throughout. Luce lost time through his belt coming off. The Matchless was evidently being held in a little, as when on the third lap it was challenged by Printz on the Bat, Collier had no difficulty in putting on a very marked amount of speed. The latter beat Printz by about 300 yards, or 9.3 seconds at a speed of 64.2 miles per hour.

		mm.	c.c.
1.	H. A. Collier (2 Matchless Jap) ...	85.4 × 64 ...	741
2.	R. L. Printz (2 Bat-Jap)	85.5 × 65 ...	746

The 1,000 c.c. Car Challenge Race was practically a foregone conclusion for Charlie Collier. Rhys got away from the mark with extraordinary celerity, whilst Collier was much slower away. However, C.R. had got well in front by the end of the railway straight, and with plenty of power in hand romped home an easy winner by two minutes, with Hunter a bad second. Rhys was suffering from misfiring. Winner's speed, 68.42 miles per hour.

		mm.	c.c.
1.	C. R. Collier (2 Matchless-Jap) ...	90 × 78 ...	998
2.	H. Hunter (2 Corah-Jap)	90 × 78 ...	738

The Fifty Miles Senior T.T. Race.

This event was for the "Alec Ross" Cup. Out of eleven entrants only six faced the starter.

Smith had entered a Singer, but elected to ride a S.I.A.M.T. of 216 c.c. Altogether this race was one of the most extraordinary that has yet taken place, not only for the unexpected finish, but also for the disappointing manner in which most of the machines behaved. Stanley, whose Singer was running in a really remarkable way, took the lead from the very start, the riders being sent off from the far side of the track at a point representing about the beginning of the half mile. Before many yards had been covered Foote had to retire through an unusual cause. His belt came off and the fastener struck him in the back, causing quite a nasty little wound.

At the end of the first lap Stanley was leading and drawing away from Elce, Ayres, and Haswell, all of whom were bunched closely together, whilst the tiny S.I.A.M.T. brought up the rear. Another lap saw Haswell get into second place. The gap between first and second steadily increased, and at the end of the tenth circuit the Singer lapped the Rudge. Ayres retired after four laps. At the end of twelve laps Haswell, who was nearly a whole circuit behind Stanley, gave up and came in with his tank smothered with oil; the cause of the trouble was not, however, given. Stanley's back tyre was evidently suffering from a puncture, but it looked as though it would hold him up long enough to finish. He stopped, however, on the sixteenth lap, as also did Elce. The latter was soon off again, but he did not appear to have much chance provided Stanley could get going once more, as with only two laps to go he was a lap and a half behind. Smith, whose little S.I.A.M.T. was running very steadily and fast, went to Stanley's assistance with a pump, but the tyre was evidently in need of repair and Stanley did not reappear. In consequence, Elce (Rudge) came in a winner, beating the S.I.A.M.T. by 1m. 3s. Stanley's luck was certainly execrable, as he had every chance of beating the fifty miles record. His best lap was done in 2m. 25s. at the rate of 67.47 m.p.h.

		mm.	c.c.
1.	W. H. Elce (Rudge)	85 × 88 ...	499
2.	S. C. W. Smith (S.I.A.M.T.) ...	65 × 65 ...	216

THE ARTHUR MOORHOUSE MEMORIAL FUND.

IN connection with the above fund, the decision to endeavour to endow a bed in the Weybridge Cottage Hospital is a particularly good one. It was felt that such a means of keeping alive the memory of one of our best known amateur motor cyclists would be entirely in accordance with what he himself would have wished. It will be in the shape of no lavish expenditure on wood, stone, or brass, but a lasting *monumentum aere perennius*—a sum of money year by year to benefit some poor sufferer in the Cottage Hospital at Weybridge, adjacent to the track on which Moorhouse spent so many happy hours.

Any contribution, however small, will be acceptable, and we hope all who knew Mr. Moorhouse or were pleased witnesses of his performances will subscribe of their ability. All subscriptions should be sent to the secretary of the A.C.U., Mr. T. W. Loughborough, 89, Pall Mall, S.W. The list of donations previously published amounts to £165 1s. 6d.

UNOFFICIAL RECORDS.

WE have been informed by W. J. Clarke, of Horncastle, that he has ridden 3,008 miles in six days by journeying daily round the following circuit: Horncastle, Market Rasen, Gainsborough, Doncaster, Gainsborough, Market Rasen, Mablethorpe, Louth, Horncastle. The circuit mileage (160) was officially supplied by Messrs. Bacon and Co. He tells us that he used a Win-Precision machine with Villiers free engine, Kempshall tyres, Druid spring forks, Eisemann magneto, Oleo plugs, Senspray carburetter, Garner exhaust whistle, XL'All pan seat, Parsons's repair outfit, Stanley rubber belt, Cox-Walker double electric lamp, Pratt's spirit, Wakefield Castrol oil, Bowden control, Burberry's overalls, trousers, and coat, Piggott's Motover boots, and Chappel and Co.'s goggles. His principal food was Oxo and Blakey's malted oats.

Mr. Clarke does not mention whose underclothing he wore, nor the brand of socks he favoured; there is also doubt about the name of his hatter.

EQ

M.C.C. MEMBERS' HILL-CLIMB.

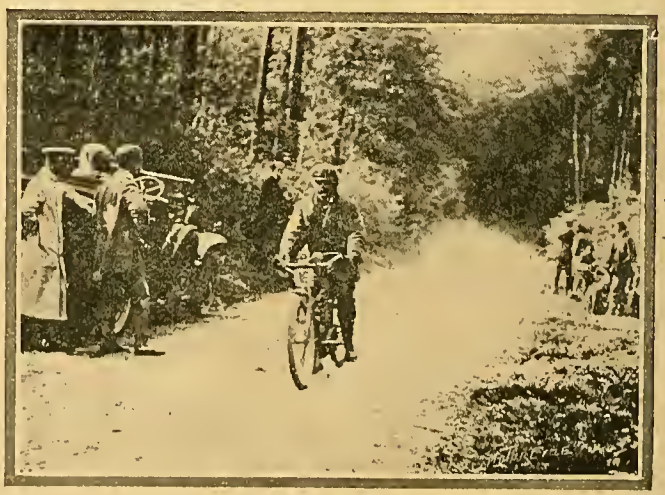
SCENE AT THE STARTING LINE. F. W. Applebee (2¾ h.p. twin Centaur) is seen waiting for the word to go.

WE were told to rendezvous on Saturday last at that well-known and picturesque hostelry, the Lambert Arms, Aston Rowant, at 1 p.m., when the venue of the climb would be announced. Our journey down from London on a new 2½ h.p. Motosacoche, that *multum in parvo* among motor bicycles, was not entirely uneventful. In Acton the back tyre caught in a dry tram rail, and for some seconds the writer wobbled twixt a tramcar and eternity in the shape of a motor omnibus until a happy recovery enabled him to pull up with the belt thrown off the pulley. Then just after the dangerous cross road at Gerrard's Cross was passed, now happily made safe by the presence of a R.A.C. touring guide, the belt pulled through, probably owing to the wrench it had had in Acton. The Motosacoche, once a mere baby, has grown greatly in strength since its birth. It is now a sturdy youngster of 2½ h.p., 64 × 90 mm., and the way the engine pulls is truly remarkable. Fitted with variable pulley gear and free engine, it is a pleasure to drive in traffic, and stops at nothing.

Another Chiltern Acclivity.

But to return to the hill-climb. The hill is of the Chiltern range, but instead of winding up gracefully like Aston Rowant, it rises abruptly from the level and reaches a maximum gradient of about 1 in 5. It possesses a fair surface which is a trifle rutty near the summit, and two easy curves, easy that is for all but the riders in the 1,000 c.c. class, who did not like the top corner, owing to it being banked the wrong way. On each side there are trees, which gave welcome shade on one of the most beautiful days of this lovely early summer.

Mr. R. H. Head, the chairman of committee, who was in charge of the start, sent up the first man at 3.10 p.m., and despatched the remainder with a safe interval between each. In the 350 c.c. class (on formula), Jacobs and Le Grand (the inseparables) did well on their Singers. With Mundy they performed a "grand slam." Fletcher made a good showing on his Douglas, changing down just as the gradient became steeper. Applebee's Centaur was also running splendidly.



CLASS 1.—Lightweights, 350 c.c.

		Fig. of merit.
1.	J. P. Le Grand (2½ Singer)	14.5
2.	W. Jacobs (2½ Singer)	14.3
3.	R. G. Mundy (2½ Singer)	13.5

Class 2, for single-cylinder machines exceeding 350 c.c. (on formula), was naturally a little more exciting. H. E. Davison (Kerry) made an excellent ascent, but he swerved badly near the top. B. Marians on a P. and M. made a good ascent, and of the four Rovers entered, C. T. Newsome and C. Q. Roberts appeared to make fastest time. F. C. North's Ariel also gave a good impression of speed.

CLASS 2.—Single-cylinders exceeding 350 c.c.

		Fig. of merit.
1.	E. A. Colliver (3½ Zenith)	13.3
2.	F. C. North (3½ Ariel)	12.8
3.	C. Q. Roberts (3½ Rover)	12.4

Dr. C. J. S. Stanley (5 h.p. Indian) making a good climb.

M.C.C. Members' Hill-climb.—

Class 3 was decided on time.

Class 3.—Single-cylinders exceeding 350 c.c.

1. C. T. Newsome (3½ Rover) ... ... 52⅖s.
2. R. Croucher (3½ Kerry) ... ... 55⅘s.
3. D. H. Noble (3½ Rover) ... ... 56⅗s.

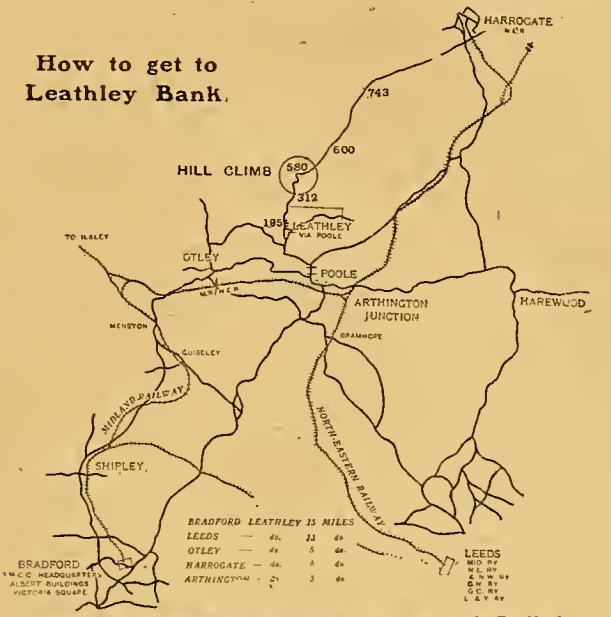
Naturally, Class 4, for multi-cylinder machines over 350 and up to 1,000 c.c. (on formula), provided some excitement. S. T. Tessier (5 h.p. Bat) and G. Brough (6 h.p. Brough) came up well. E. B. Dickson (8 h.p. Bat) rode sitting upright. F. W. Barnes and E. B. Ware (Zeniths) made splendid ascents.

Class 4.—Multi-cylinders not exceeding 1,000 c.c.

		Fig. of merit.
1.	E. B. Ware (6 Zenith)	13.4
2.	S. T. Tessier (5 Bat)	10.5
3.	F. W. Barnes (6 Zenith)	10.2

Class 5 was decided on time. Brough's machine had a weird guard over the valves, with copper pipes apparently connected to nothing at all issuing vertically therefrom. Brough said it was to keep the flies off the engine, but we venture to think otherwise.

Class 5.—Multi-cylinders not exceeding 1,000 c.c. (on time).



1. S. T. Tessier (5 Bat) ... ... 42⅖s.
2. G. Brough (6 Brough) ... ... 44⅖s.
3. F. W. Barnes (6 Zenith) ... ... 48⅗s.

The sidecar class finished the event as far as *The Motor Cycle* is concerned, as the cyclecar class was abandoned owing to lack of support. F. J. Watson (3½ h.p. Swift single-gear), with a child as passenger, made an excellent ascent. Barnes, with the faithful Weatherilt as his companion, made the star performance. Pratt, with the stentorian Cooper in the sidecar, made a good showing; while Wells, with Mrs. Wells on board, made a fast climb.

Class 6.—Sidecars not exceeding 1,000 c.c.

		Fig. of merit.
1.	F. W. Barnes (6 Zenith sc.)	11.3
2.	F. J. Watson (3½ Swift)	10.5
3.	W. Pratt (3½ P. and M.)	10.1

The awards were gold, silver, and bronze medals in each class, while gold medals were presented by Mr. E. B. Dickson to the fastest novices in Classes 3 and 5 if there were not less than six such entries.

Map showing the location of Leathley Bank, the venue of the Bradford M.C.C. open hill-climb on Saturday next.

RESULTS OF THE MERSEY M.C. 24 HOURS' RELIABILITY TRIAL.

The following riders in the Mersey Motor Club's open twenty-four hours' reliability trial (described in our last issue) have been awarded gold medals:

Winner of the Butler Cup.

Hugh Gibson (3½ h.p. Bradbury, Bradbury gear).

Gold Medals.

F. Rees (3½ h.p. Rudge, N.S.U. gear).
W. E. Rootes (3½ h.p. Singer, Sturmey-Archer gear).
N. Howarth (3½ h.p. Bradbury, N.S.U. gear).
N. H. Browne (7 h.p. Indian, Indian gear).
Alex C. Smith (3½ h.p. Rudge).
M. Rimmer (3½ h.p. Zenith, Gradua gear).
Rex G. Mundy (3½ h.p. Singer, Armstrong gear).
W. Scott Clarke (3½ h.p. Rover, Armstrong gear).
George Wray (3½ h.p. Bradbury, Wray gear).
J. Cadwallader (2¾ h.p. Enfield, Enfield gear).
A. Marston (8 h.p. Matchless).
Harry Reed (8 h.p. Dot-Jap, two-speed).
J. H. Roscoe (3½ h.p. Singer).
R. Lord (6 h.p. Rex Sidette).

Silver medals have been awarded to all who finished the course but did not keep to schedule time. They are:

W. Heaton (2¾ h.p. A.J.S., A.J.S. gear).
W. Davies (3½ h.p. Victoria-Jap).
C. Hobbs (2¾ h.p. Humber, Armstrong gear).
G. Gregson (3½ h.p. Bradbury).
A. J. Jenkins (3½ h.p. Macbeth, Armstrong gear).
W. Houghton (3½ h.p. Bradbury).

BIRMINGHAM M.C.C. MEMBERS' HILL-CLIMB.

A very successful hill-climb for members of the club only was held at Highley Hill, between Bewdley and Bridgnorth, on Saturday last. The hill is about a quarter of a mile long, and has a maximum gradient of 1 in 5, with an average of about 1 in 7.

R. H. Edwards (Triumph) and H. C. Newman (Ivy-Precision) tied for first place in Class 2. On running off, Newman improved on his first time by ⅖s., and beat Edwards by ⅖s.

In Class 1, Miss Hough and J. J. Woodgate tied, and on running off Miss Hough proved the fastest.

Electrical timing and a telephone were used, and the events were run off in seventy-six minutes. Results:

Class 1.—Lightweights.

1. F. S. Whitworth (2¾ Douglas) ... ... 22s.
2. P. W. Owen (2¾ Zenith) ... ... 22⅕s.
3. Miss Hough (2¾ Douglas) ... ... 25s.

Class 2.—Under 500 c.c.

1. H. C. Newman (3½ Ivy-Precision) ... 16⅕s.
2. R. H. Edwards (3½ Triumph) ... ... 16⅕s.
3. H. R. Fowler (3½ Norton) ... ... 17s.

Class 3.—Under 750 c.c.

1. A. D. Arter (James) ... ... 20s.
2. T. Pollock (James) ... ... 20⅕s.
3. T. F. Blumfield (Blumfield) ... ... 22⅖s.

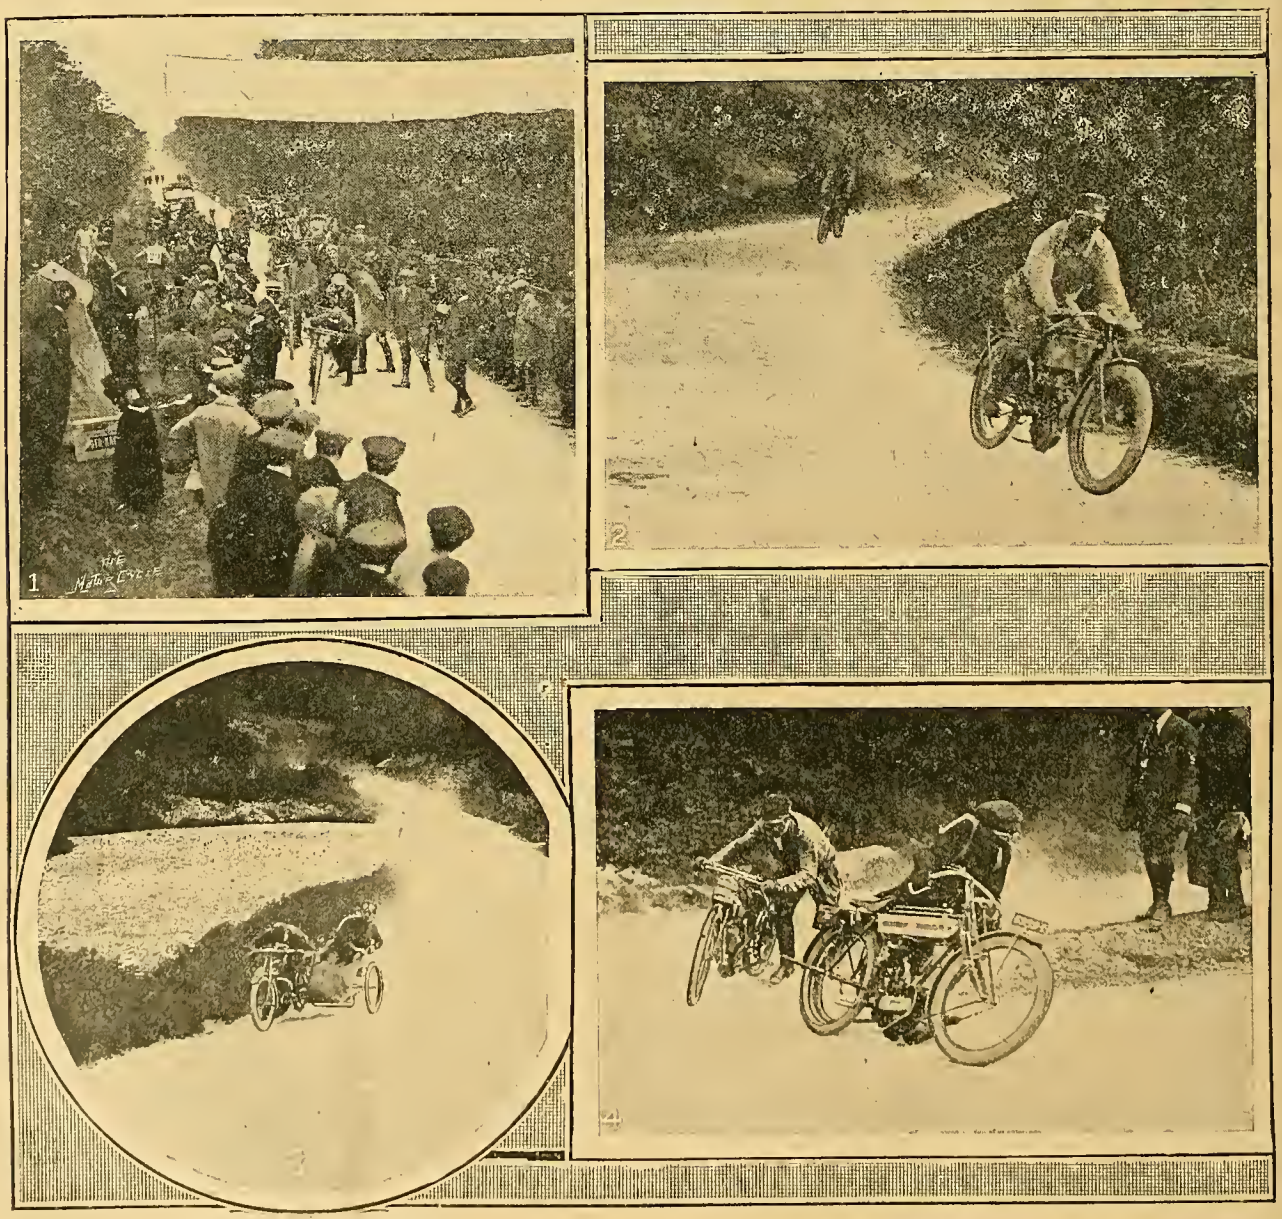
Class 4.—Under 1,000 c.c.

1. H. C. Newman (3½ Ivy-Precision) ... 16s.
2. R. H. Edwards (3½ Triumph) ... ... 16⅘s.
3. H. R. Fowler (3½ Norton) ... ... 17⅕s.

Class 5.—Single-cylinder passenger.

1. H. C. Newman (3½ Ivy-Precision sc.) ... 25s.
2. C. Smith (4¼ Regal Precision sc.) ... 31s.
3. B. Bourke (3½ New Hudson sc.) ... 34⅕s.

Class 6.—Twin-cylinder passenger.



1. F. H. Southam (6 Zenith sc.) ... ... 29⅖s.
2. E. W. Starkey (8 Morgan Runabout) ... 31⅖s.
3. Dr. B. Fawsset (8 Chater-Lea sc.) ... 32⅘s

French Road Race—The Circuit de l'Eure.

AN important road race organised by the Motocycle Club de France, over a course of 288 kilometres in length, took place on the 12th inst. Competitors to the number of thirty, whose machines had been weighed and sealed the day previous, were despatched from Vernon at half minute intervals by M. Polack. The course, although not dangerous, was hilly, and comprised several sharp corners, eleven of the latter occurring in a distance of less than a quarter of a mile. There were also two or three hair pin bends which were difficult to negotiate, so difficult, in fact, that some riders had to walk round them. The first few circuits were covered at a hot pace, ten competitors giving the impression of being likely to win. Retirements commenced in the fourth round.

Positions at half-distance showed that Péan (Peugeot) was leading, followed by Pernette and Dancart (La Française), Lacroix (Peugeot), Naas (Griffon), Gabriel (Triumph), and Chartier Devarennes (Indian), in the order named. In the eleventh circuit Devarennes broke his handle-bar, and Gabriel (Triumph) suffered a burst tyre. Pernette lost ground, and Dancart and Naas improved their positions. The winner averaged 37½ m.p.h. The results by classification are :

			h.	m.	s.
		SIDECARS.			
Trade.—		H. G. Dixon (New Hudson)	6	36	48⅗
Amateur.—		Bloch (René-Gillet)	5	45	58⅘
		MOTOR BICYCLES, 350 C.C.			
Trade.—	1.	Péan (Peugeot)	4	46	18
,,	2.	Pernette (Française)	5	16	35⅕
		MOTOR BICYCLES, 500 C.C.			
,,	1.	Dancart (Française)	5	3	57

Hill-climb in the North.

The Manchester Motor Club is to organise an open hill-climbing contest in July.

M.C.C. London to Edinburgh Run.

The entry for the London to Edinburgh run is again a record, beating last year's figures of 162. The next club run will give members an opportunity of becoming familiar with the first forty miles of the course which will have to be covered in the dark.

Police Traps.

A police trap is in operation during week-ends on the Ashford-Hythe-Folkestone road at Newing Green Corner. Motorists are warned to exercise caution when riding into Hythe on this road. At Christchurch, the police have a trap which is worked occasionally.

Imports and Exports of Motor Cycles.

Imports for the month of April and for the four months ending April 30th have increased considerably in value, while the British exports during the same period have increased to an enormous degree. Below are given the actual figures culled from the Board of Trade returns:

IMPORTS.

Month ending April 30th.

1910.	1911.	1912.
No. of machines—		
163 ...	203 ...	174
Value with parts—		
£11,020 ...	£12,106 ...	£17,534

Four months ending April 30th.

1910.	1911.	1912.
No. of machines—		
509 ...	612 ...	567
Value with parts—		
£35,817 ...	£40,661 ...	£50,721

The actual numbers of complete motor cycles imported have decreased, the increase in value being accounted for by imported parts.

EXPORTS.

Month ending April 30th.

1910.	1911.	1912.
No. of machines—		
171 ...	408 ...	779
Value with parts—		
£11,196 ...	£22,339 ...	£42,408

Four months ending April 30th.

1910.	1911.	1912.
No. of machines—		
801 ...	1,801 ...	3,483
Value with parts—		
£42,102 ...	£86,426 ...	£184,048

A.A. and M.U. Motor Cycle Members.

The increase of membership of the A.A. and M.U. in April was no less than 2,691. The total membership is well over 43,000, and it is interesting to note that of this number just under 10,000 are motor cyclists.

International Road Race in France.

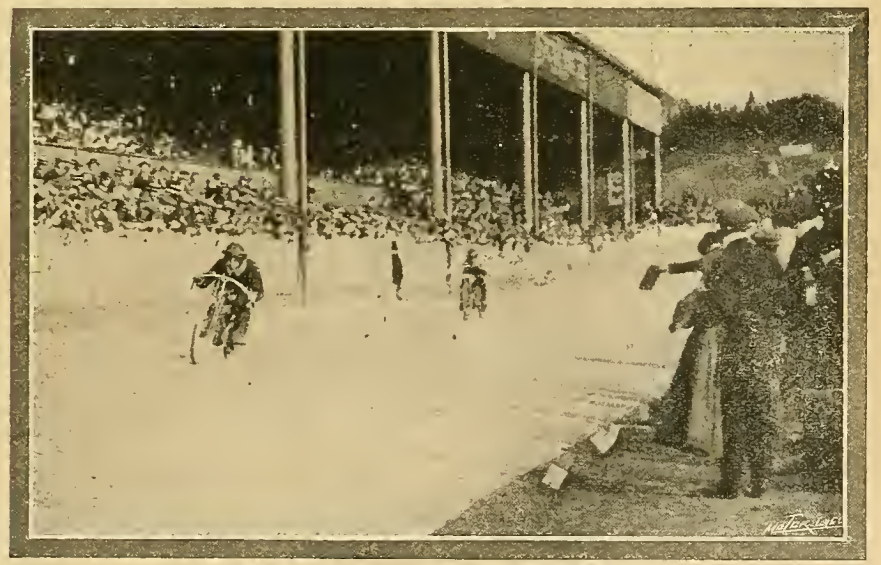
The French representative of the Singer Company, Ltd., has entered four Singer motor bicycles for Le Mans automobile meeting. Two of these will compete in the 350 c.c. class and two in the 500 c.c. class. Entries close on the 19th inst., and should be sent to the Secretary of the Automobile Club de Seine et Oise, Le Mans, or the Manager of *L'Auto*, 10, Rue de Faubourg Montmartre, Paris.

The Team Trial.

Daventry (Northants) has been selected by the M.C.C. as the centre for the team trials on June 15th.

Further clubs which have notified the trials hon. secretary, Mr. F. J. Jenkins, of their intention to compete in the team trials are the North Middlesex M.C.C., the South Birmingham M.C.C., and the Walthamstow M.C., bringing the total number of teams to twenty-four—an easy record. It would appear that the Derby and District M.C.C. will have some difficulty in retaining possession of *The Motor Cycle* fifty-guinea cup in face of such opposition.

SPECIAL FEATURES.



IMPORTANT FRENCH ROAD RACE.
(Illustrated.)

A SECOND MOBILISATION TEST.

WEEK-END COMPETITIONS.
(Described and Illustrated.)

Lightweight Racing at Aston.

The races arranged by the Sutton Coldfield and Mid-Warwickshire A.C., and which were to have been held on the 4th inst., were run off on the Aston track last Saturday. The first event was a three miles scratch race for lightweights not exceeding 350 c.c. The winners of the heats were as follow: Heat 1.—J. Woodhouse (2½ h.p. Regal-Precision), 4m. 3⅕s. Heat 2.—S. L. Bailey (2¾ h.p. Humber), 3m. 58⅘s. Heat 3.—F. W. Dayrell (2¾ h.p. Martin-Jap), 4m. Final.—1, Bailey; 2, Woodhouse. Winner's time, 3m. 50⅗s. This race was followed by a five-mile handicap for T.T. lightweights and resulted as follows: Heat 1.—S. L. Bailey, 6m. 8⅖s., handicap 7½s. Heat 2.—J. St. John (2 h.p. Humber), 8m. 32⅖s., handicap 10s. Heat 3.—J. Woodhouse, 6m. 46⅗s., handicap 3½s. Final.—1, S. L. Bailey, 7m. 50⅗s.; 2, J. Woodhouse, 8m. 0⅕s.; 3, J. St. John, 8m. 7⅘s. J. St. John won a gold medal in each event for best amateur performance. S. L. Bailey's riding was warmly applauded by the big crowd; he rode his T.T. Humber in fine style. Gears were restricted to 5 to 1.

SATURDAY'S ASTON TRACK RACE MEETING.

S. L. Bailey (twin Humber) lapping J. W. Woodhouse (Regal-Precision) in the last lap at Aston track, and making fastest time. Bailey, who is a well known Australian rider, won both the three miles scratch race and the five miles handicap, riding in superb style.

Proposed Ten-mile Limit.

The local tradesmen's association in Fulham is proposing a ten-mile limit along Fulham Road, and is canvassing householders for signatures.

Amalgamation of French Clubs.

The Touring Moto Club de France received the other evening a delegation from the Moto Club de France proposing that the two bodies should amalgamate. It appears probable that this amalgamation will actually take place.

Another Mobilisation Scheme.

The next mobilisation test of motor cyclists is arranged for Sunday, June 9th, at 1 p.m. The scheme is explained by "Celeriter" in another part of this issue. An exclusive announcement in the same article refers to a Cyclist Battalion for Birmingham.

French Motor Cycle Derby.

The Grand Prix de Champagne, to which we referred in our last week's issue, certainly promises to be an interesting event. Numerous competitors, we learn, have already begun to practise on the course.

T.T. Race Fund.

The following additional donations have been made to the above fund:

Price's Patent Candle Co. ...	5	5	0
Vacuum Oil Co.	5	5	0
Cambridge U.M.C.C.	1	1	0
E. M. P. Boileau	10	0	

The total amount subscribed is just under £31.

Prodigious Speed for a 3½ h.p.

The fastest speed accomplished on a 3½ h.p. single-cylinder machine was raised to 75½ m.p.h. by G. E. Stanley, riding a Singer, at Brooklands, last Saturday. It is not generally known that Stanley takes his inlet valve cam to all race meetings in his pocket, fits it on the spot, and removes it again immediately the event is over.

Open Amateur Hill-climb.

The Sutton Coldfield and Mid-Warwickshire A.C. have received good entries for each class for their open amateur hill-climb at Wenlock Edge on Saturday. Class I., for single-cylinder touring machines up to 520 c.c., has drawn sixteen entrants; Class II., twin and single tourist up to 350 c.c., 12; Class III., T.T. twins and singles up to 500 c.c., 27; and Class IV., unlimited, 15. The events will be run off on the knock-out system, and some good sport should be witnessed.

T.T. Entrants and the Olympia Show.

The Scott Engineering Co., Ltd., have sent us a copy of a resolution passed at the meeting of the Manufacturers' Union on the 1st inst., with a request that we give it publicity. The resolution reads as follows: "That in all cases where a bond is adopted by 80 per cent. of the members of any section those members of that section refusing to sign such bond shall be excluded the first ballot for space at any exhibition which may hereafter be promoted by the Union, and from all benefits as to rebates or allowances in respect of show charges." It will be remembered that the Scott Engineering Co., Ltd., and Messrs. H. Collier and Sons, Ltd., declined to sign the T.T. bond.

FUTURE EVENTS

May 18.—North West London M.C.C. Passenger Trial to Coventry and back.
„ 18.—Birmingham M.C.C. Open Cyclecar Reliability Trial.
„ 18.—Bradford M.C.C. Annual Open Hill-climb.
„ 18.—Sutton Coldfield and Mid-Warwickshire A.C. Open Amateur Hill-climb.
„ 24 to 27.—M.C.C. London to Edinburgh Run.
„ 27.—Dublin M.C.C. Open Reliability Trial and Sidecar Competition.
June 15.—M.C.C. TEAM TRIAL.

Remarkable Results in Consumption Test.

In the Oxford M.C.C. petrol consumption test on Saturday, H. S. Askew (3½ Triumph, single-gear, and sidecar), total weight 670 lbs., covered 36 miles with a petrol consumption of 31 ozs. 2 drams = 186 miles to the gallon. H. G. Hill (2½ Calcott) was first in the single class.

M.C.U. of Ireland (Ulster Centre).

An open reliability trial will take place on the 18th inst. The start will be from Fortwilliam Park, and the route *via* Cushendun and the Cush Lake Road to Ballycastle. There will be a non-stop from Cushendun to Ballycastle, and observers will be posted on the hills.

The T.T. Races.

Up to the present, nineteen machines have been entered for the Junior and thirty-three for the Senior Tourist Trophy Races, to be held in the Isle of Man on June 28th and July 1st respectively. The Auto Cycle Union, which is organising the contests, anticipates that by June 1st, the date for closing of entries, the total will reach between fifty and sixty for the Senior and thirty for the Junior.

20,000 Miles on a Singer Sidecar.

Harry Long completed the first 5,000 miles of his trip in Bristol on the 14th inst. He is now in Cornwall. Most of his ride so far has been in the North, and he has visited thirty-six counties. He has had no trouble with his engine or with the police, though he has passed through many police traps.

English-Dutch Reliability Trial.

Only a few voting sheets circulated among the clubs are still outstanding, and it is hoped to be able to announce the composition of the British teams by the end of the month. Club secretaries will oblige by bringing the names of the entrants to the notice of their respective committees at the earliest opportunity.

The R.A.C. and A.C.U. Guides.

Numerous R.A.C. road guides are now to be found on our highways. The services of these guides are at the disposal of all motor cyclists bearing the badge of the A.C.U. and affiliated clubs. Each guide is well acquainted with the district in which he is on duty, and will gladly give information and assistance to all who are in need.

Hammersmith Speed Limit Application Refused.

It will be remembered that a Local Government Board inquiry was held in February last into an application made by the London County Council for the imposition of a speed limit of five miles an hour at Hammersmith Broadway and its immediate approaches, and for a ten-mile speed limit along Hammersmith Road from its junction with Hammersmith Broadway to its junction with Brook Green. The application was strongly opposed by the Royal Automobile Club and the Automobile Association and Motor Union, and it is gratifying to record that the Local Government Board has refused the application.

M.C.C. MEMBERS' HILL-CLIMB NEAR ASTON ROWANT.
S. T. Tossier (Bat-Jap) at full speed past the bend. He was the winner of two classes.

Edinburgh and District M.C. Open Hill-climb.

The meeting at Manor Hill, near Peebles. Scene at the start.

THE above annual contest took place at Manor Hill, Peebles, on Saturday last, in indifferent weather. Rain threatened in the earlier part of the day, and gradually gave way to a strong westerly wind, which helped the competitors to some extent. The surface of the road had been specially swept overnight in readiness for the contest, but, in spite of this, it appeared somewhat loose in parts. The attendance proved to be the best the club has had at Manor Hill, and a greatly increased number of spectators, mostly from the adjacent districts, viewed the competition. As usual with the Edinburgh meetings, the contest started promptly at 4 p.m., and finished in good time.

Lindsay (2¾ h.p. New Hudson) made a very fine ascent, his time being better than many larger machines, and his figure of merit was the highest for the day. In the open scratch class, R. S. Morrison (5 h.p. Bat) and A. H. Alexander (7 h.p. Indian) tied for first place, but on a re-run the former improved his time by ⅗s., and so won. Reference must also be made to the performance of J. Donaldson (3½ h.p. Matchless), who in the open scratch class, competing against big twins, tied for third place.

A. H. Alexander (2¾ h.p. Douglas) awaiting the signal to start.

The Results.

CLASS I.—Formula. Not exceeding 400 c.c.

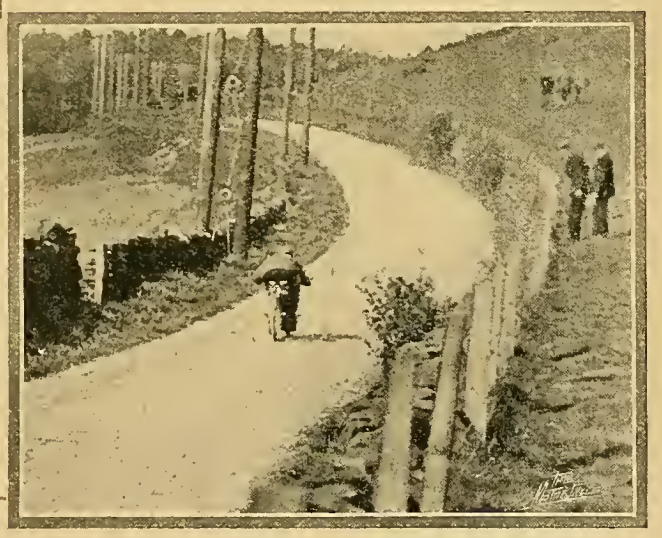
	Fig. of merit.	Time.
1. A. J. C. Lindsay (2¾ New Hudson)	1,019	35.2s.
2. H. Berwick (2¾ New Hudson)	710	40.4s.
3. A. H. Alexander (2¾ Douglas)	708	40.8s.

CLASS II.—Formula. Exceeding 400 and not exceeding 600 c.c.

1. P. E. Tolfree (3½ Matchless)	754	32.4s.
2. H. Berwick (3½ New Hudson)	665	34.8s.
3. O. G. Braid (3½ Norton)	652	35.2s.

CLASS III.—Formula. Exceeding 600 c.c.

1. J. D. Morrison (5-6 Bat)	619	28.8s.
2. J. Steele (5 Indian)	581	35.6s.
3. A. J. C. Lindsay (5-6 Matchless)	580	30.4s.



The results of Class IV. are withheld owing to a protest having been lodged.

CLASS V.—Formula. Passenger machines, any size engine.

1. H. Berwick (3½ New Hudson)	736	57.6s.
2. J. R. Alexander, jun. (7 Indian)	527	52.2s.
3. F. J. Hutchison (5-6 Rex-Jap)	459	64.6s.

CLASS VI.—On time only. Not exceeding 600 c.c.

1. P. E. Tolfree (3½ Matchless)	30.8s.
2. J. Gerard (3½ Bradbury)	33s.
3. A. B. Lindsay (3½ Triumph)	35s.

A. B. Lindsay (3½ h.p. Triumph) negotiating the bend.

CLASS VII.—Time only. Exceeding 600 c.c.

1. H. S. Morrison (5-6 Bat)	26.2s.
2. A. H. Alexander (7 Indian)	26.6s.
3. J. Donaldson, jun. (3½ Matchless)	28.4s.
3. A. J. C. Lindsay (5-6 Matchless)	28.4s.

It is an item of interest in connection with this hill-climb that each competitor was allotted a starting time in the programme, the exact time being printed alongside each name. It was also one of the rules of the competition that riders who were not ready to start at the appointed time would not be allowed to take part.

COVENTRY CLUB'S OPEN RELIABILITY TRIAL.

In our description of the above trial in last week's issue, we ascribed J. W. F. Crouch's stops on the hills to insufficient weight on the back wheel of his C.M.C. carette. Mr. Crouch differs in his opinion, being confident that the stops were due to the use of a plain driving tyre.

C. Q. Roberts (Rover) was stated to have pedalled on Ilmington Hill in the official results. We are asked to state that this was an error, Mr. Roberts in fact climbing the hill on the middle gear of his Armstrong.

It appears that H. G. Hill rode a single-geared Calcott lightweight, and not a three-speed as stated.

RACING AT PORTMARNOCK.

A VERY good entry was secured for the supplementary meeting of the Dublin and District M.C.C. at Portmarnock on Saturday last, and some good racing was seen. T. Summerfield, a novice, got into some loose sand, wabbled badly, and fell. He was unconscious for some time, but was ultimately able to ride home. This is the first accident at Portmarnock in ten years' racing. Results :

SIX MILES NOVICE HANDICAP.

		Handicap.
1.	J. L. Walshe (3½ h.p. Triumph) ...	1m. 0s.
2.	A. J. Read (3½ h.p. Indian) ...	1m. 30s.
3.	O. G. Price (3½ h.p. Rudge) ...	1m. 30s.

Twelve others competed; the winner finished 15s. in front of the second man, third close up.

FOUR MILES SCRATCH.—Engines under 520 c.c.

		Time.
1.	T. E. Greene (3½ h.p. Rudge) ...	5m. 19⅗s.
2.	F. J. Walker (3½ h.p. Rudge) ...	5m. 22s.
3.	J. Healy (3½ h.p. Rudge) ...	5m. 33s.

Four others rode.

TWENTY MILES HANDICAP.

		Handicap.	Time.
1.	O. G. Price (3½ h.p. Rudge)	6m. 0s. ...	31m. 27⅕s.
2.	T. E. Greene (3½ h.p. Rudge)	2m. 30s. ...	28m. 52s.
3.	F. J. Walker (3½ h.p. Rudge)	20s. ...	27m. 2s.

Eight others also rode. Won by 55s., 20s. between second and third.

OPEN HILL-CLIMB AT RHUBINA.

The annual event organised by the Cardiff Motor Club took place at Rhubina, near Cardiff, on Saturday. The feature of this year's contest was the invitation extended by the club to other clubs in South Wales for their members to compete. The entries numbered fifty-five, and a start was made about 3 p.m. The course was about 2,880 feet long, with an average gradient of 1 in 14.6, the steepest part being 1 in 7.8. The results in Classes 3, 5, 6, 7, and 8 being on the following formula $\frac{C \times T^2}{W}$, as recommended by *The Motor Cycle*; the results in Class 4 being on time only.

Some exceedingly close times were recorded, and as many as three competitors in Class 4 tied for fastest time. This necessitated a run off to decide the winner.

The results were as follows :

Classes 1 and 2.—Cancelled for want of entries.

In Class 3 (touring single-cylinders up to 560) there were twelve entries. Results.

		Time.	Fig. of merit.
1.	F. J. Tanner (3½ Triumph) ...	51⅗s. ...	253
2.	S. Davies (3½ Triumph) ...	55s. ...	246
3.	A. W. Jones (3½ Rudge) ...	55⅗s. ...	213

Fastest time : F. J. Tanner.

Class 4 (Tourist Trophy machines not exceeding 500 c.c.), also twelve competitors :

1.	J. C. Moore (3½ Rudge)	44⅗s.
2.	H. Britton (3 Pioneer)	45⅗s.
3.	H. Wessendorf (3½ Premier)	46s.

Class 5 (twin-cylinder machines exceeding 480):

		Time.	Fig. of merit.
1.	A. B. Wade (6 Zenith)	44⅘s. ...	252
2.	E. Chapman (6 Zenith)	45⅘s. ...	242
3.	A. V. Shirley (7 Indian) ...	44⅖s. ...	208

Fastest time: A. V. Shirley.

Class 8 (motor cycles with sidecar attachments):

1.	A. B. Wade (6 Zenith) ...	58⅗s. ...	239
2.	F. J. Tanner (3½ Triumph) ...	68s. ...	233
3.	E. Chapman (6 Zenith) ...	61⅕s. ...	215
4.	G. H. Smith (8 J.A.P.) ...	58⅖s. ...	208

Fastest time: G. H. Smith.

Winner of the Humber Cup, presented by Humber, Ltd., Coventry, awarded for the fastest time of the day: A. V. Shirley (7 h.p. Indian).

Winner of the Rudge Cup, presented by Rudge-Whitworth, Ltd., for the best figure of merit in Class 3 or 5 : Sylvanus Davies (3½ Triumph).

CLUB NEWS.

North Staffordshire M.C.C.

The members' reliability team trial took place last week in bad weather over a difficult course. Four teams, each made up of four riders, started, but only five men got through. The route was *viâ* Newcastle-under-Lyme, Cobridge, Leek, Burbage, Cat and Fiddle, Macclesfield, Congleton, Barbage, and back to Whitmore, and in the afternoon through Newport, Shrewsbury, and Market Drayton. Results :

		Marks lost.
	G. Jones (3½ Zenith)	0
	P. S. Clewes (2¾ Enfield)	6
	W. Baines (3½ Triumph)	12
	J. A Prendergast (3½ Rudge)	16
	E. Bailey (6 Matchless)	50

Westmorland M.C.C.

A successful hill-climb was held on Aughton Hill on the 8th inst. Results :

LIGHTWEIGHTS.

		Formula.
1.	L. L. Pearce (2¾ Humber)	50.1
2.	F. Burn (2¾ New Hudson)	77.2

SINGLES.

1.	B. Jeffreys (3½ Triumph)	63.6
2.	G. W. Braithwaite (3½ Zenith)	64.8
3.	R. Bowness (3½ Matchless)	70.4

TWIN CLASS.

1.	L. S. Parker (3¾ Scott)	76.8
2.	E. Jeffreys (5 Indian)	84.3
3.	E. F. Baxter (6 Rex)	108.

Fastest time: Robin Bowness (3½ T.T. Matchless).

Nottingham and District M.C.C.

Results of the hill-climb, held at Hardwick on the 4th inst. :

	TOURING CLASS.	Time. m. s.	Fig. of merit.
1.	Reg. Holloway (2½ Premier) ...	2 3⅕ ...	106.95
2.	J. King (2½ Premier)	2 21⅖ ...	111.3
3.	J. R. Sylvester (2¾ New Hudson) ...	2 5⅕ ...	130.1
	T.T. CLASS.		
1.	J. R. Sylvester (2¾ New Hudson) ...	1 53⅘ ...	117.2
2.	J. J. Kelly (3½ Rudge)	1 53 ...	156.2
3.	*Reg. Holloway (3½ Premier) ...	1 48⅕ ...	159.

*Fastest time of the day.

Walthamstow M.C.

A non-stop and speed-judging competition was held on the Cambridge Road over a distance of fifty-one miles, which had to be covered at a speed of 20 m.p.h. Results :

	PASSENGER CLASS.	Time error. m. s.
1.	G. West (5 A.C. tricar)	1 50⅘
2.	— Shelley (3½ Humber sc.)	2 22
3.	G. Henbrey (5 A.C. tricar)	2 59
	MOTOR BICYCLE CLASS.	
1.	J. Beal (3½ N.S.U.)	2 54
2.	F. W. Applebee (3½ Centaur)	3 43⅗
3.	F. Gallehawk (3½ Rex)	5 33⅖

Essex M.C.

On the 28th ult. a club run took place to Laindon Hills, and an impromptu fast and slow hill-climb was held. Results : D. S. Kapadia (8 h.p. Rex-Jap and sc.), difference 10m. 5s.; F. W. Applebee (2¾ Centaur), 6m. 25s.; B. Alan Hill (7 h.p. Indian and sc.), 4m. 4s.

BRADFORD M.C.C. RELIABILITY RUN TO KESWICK AND BACK FOR THE N.S.U. CUP. J. Norman Longfield (Scott) starting. The results are not known as yet.

Ipswich and District M.C.C.

Results of members' hill-climb held on the 11th inst., in Woolverstone Park, by kind permission of Mr. Chas. Hugh Berners, J.P.:

CLASS I.—Single-cylinder Touring Models up to 500 c.c.
1. W. J. Coe (1909 Triumph) ... ... 24⅕s.
2. K. Portway (1911 B.S.A.) ... ... 26⅗s.
3. W. Sneezum (1912 L.M.C.) ... ... 28⅕s.

CLASS II.—Single-cylinder T.T. Models up to 500 c.c.
1. E. Herdman (1912 Rudge) ... ... 22⅗s.
2. D. Popplewell (1912 Triumph) ... ... 23⅗s.
3. W. Sneezum (1911 L.M.C.) ... ... 24⅖s.

CLASS III.—Any machine up to 500 c.c.
1. W. Sneezum (1911 L.M.C.) ... ... 23⅗s.
2. E. Herdman (1912 Rudge) ... ... 24s.
3. D. Popplewell (1912 Triumph) ... ... 24⅗s.

CLASSES IV. AND V.—Lightweights up to 400 c.c.
1. D. Popplewell (1912 Singer) ... ... 25⅕s.
2. F. G. Hammond (1911 Douglas) ... ... 35⅕s.
3. Dr. Hoyland (1912 Singer) ... ... 36s.

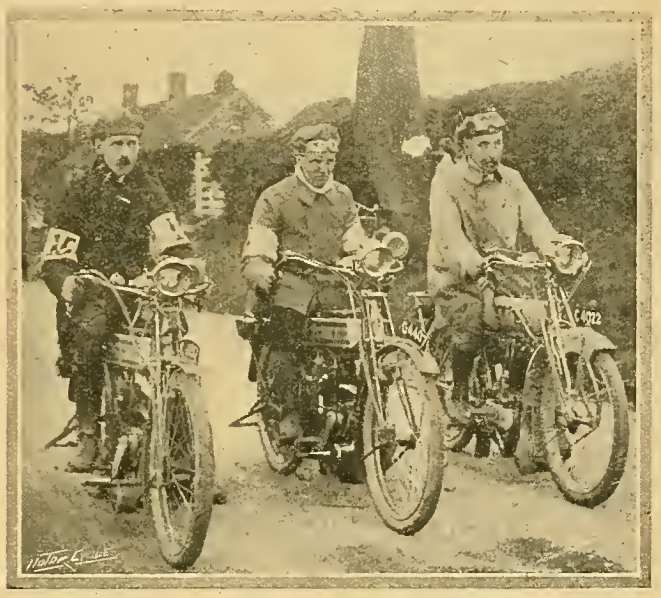
CLASS VI.—Any Machine up to 1,000 c.c.
1. E. Herdman (1912 Rudge) ... ... 22⅕s.
2. D. Popplewell (1912 Triumph) ... ... 23⅕s.
3. W. Sneezum (1911 L.M.C.) ... ... 24⅖s.

CLASS VII.—Slow Climb (knock-out).
1. D. Popplewell (1912 Singer)
2. Dr. S. S. Hoyland (1912 Singer)
3. W. E. Sneezum (1912 L.M.C.)

Fastest time of the day: E. Herdman (T.T. Rudge), 22⅕s. Course, 400 yards in length; hill with severe "S" bend.

Harrogate and District M.C.C.

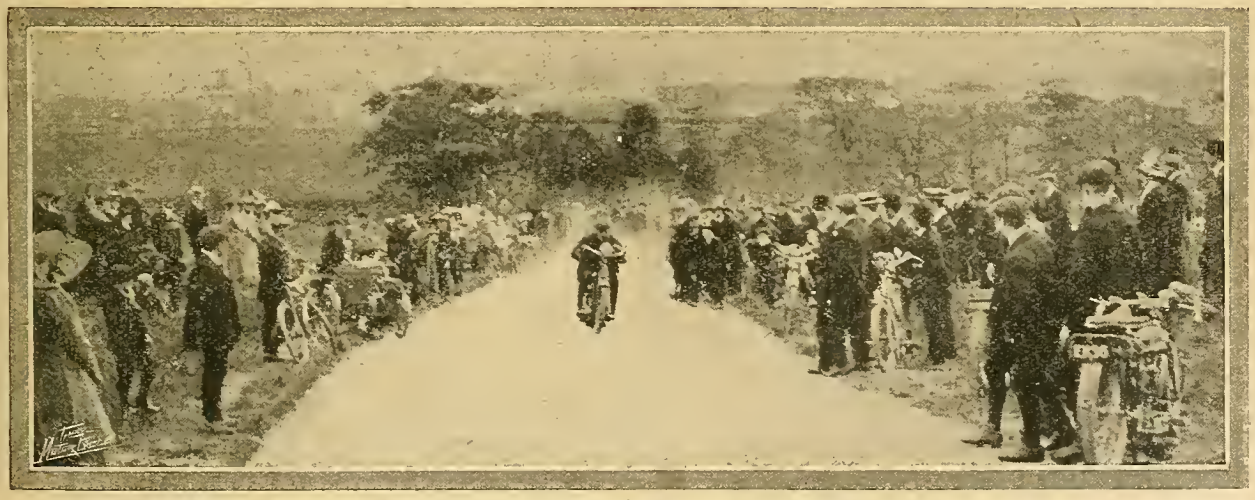
A handicap speed trial was held on the 11th inst. The result was as follows: Semi-final.—T. C. Atkinson (2¾ New Hudson) a bye; W. Fawcett (6 Zenith), beat H. W. Fortune (3½ Brown). Final.—Fawcett beat Atkinson. W. Fawcett therefore holds the cup, and can now be challenged by any member to contest his position.



Sheffield University M.C.C.

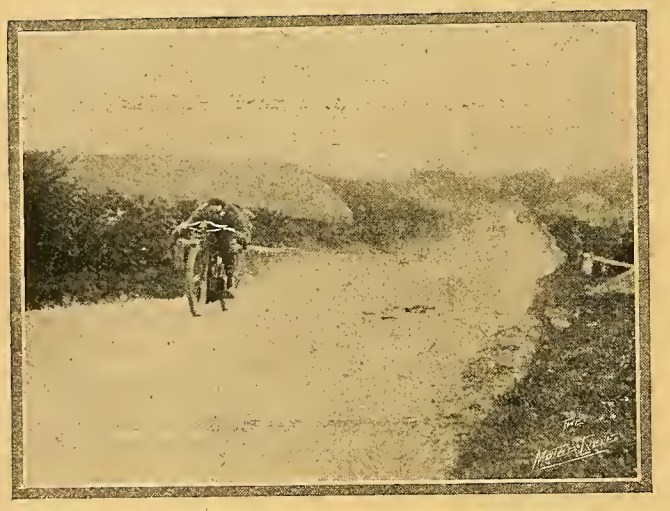
The newly formed Motor Cycle Association of Sheffield University held its inaugural competition on the 11th inst. at Redmires, on a steep by-road having a gradient of 1 in 5. The results are as follow:

Heavyweights.—1, E. L. Moxey (8 h.p. Matchless), 40s.; 2, H. Hart-Davies (5 h.p. twin Rex), 53⅕s.



Medium Class (Singles).—1, H. Eardley (3½ h.p. T.T. Premier), 32⅖s.; 2, J. W. Gould (3½ h.p. Premier), 39⅖s.; 3, R. B. Nicholson (4 h.p. Campion), 40s.

Lightweights.—1, T. G. Hall (2¾ h.p. Minerva), 71⅕s.; 2, Birch (2¾ h.p. Douglas), 83s.



THREE ENTHUSIASTIC MEMBERS OF THE DONCASTER AND DISTRICT M.C.C.

E. Goult, the club secretary, is in the centre, F. H. Dunstan and J. Wilkinson to the left and right of him. The trio rode from Doncaster and took part in the Middlesbrough M.C.C. flexibility hill-climb at Yearby Bank the same evening, J. Wilkinson (5 h.p. Matchless-Jap) making fastest time, and Goult (3½ h.p. Rudge) being fastest of the single cylinder riders.

WIGAN M.C.C. HILL-CLIMB AT RIVINGTON PIKE.

Bolton (6 h.p. Enfield) making a good ascent. This competition was held on the 12th inst., and a big crowd was present.

E. H. Lees (7 h.p. Indian) at speed. He was winner of the All-comers' Class at the Cambridge University M.C.C. hill climb.

Cambridge University M.C.C.

A very successful hill-climb on the knock-out principle was held on Onvell Hill, near Cambridge, on the 8th inst. The hill is about five-eighths of a mile long and quite straight. Results:

Class I. (Standard Touring Singles), Final.—T. Reid (Triumph) beat N. B. Stewart (Zenith).

Class II. (Tourist Trophy Singles), Final.—E. S. Brittain (Triumph) beat J. Reid (Triumph) fairly easily.

Class III. (All Comers), Final.—E. H. Lees (Indian) beat G. F. Randall (Bat). Both started well, but the Indian drew away and romped home an easy winner.

Belfast and District M.C.

This club held a very successful hill-climb on Saturday last at Bangor, Co. Down. The afternoon was most favourable, and the hill, which measures a little over half a mile, was in capital condition. The result, which was based on A.C.U. formula, was very close. S. Corry (3½ h.p. Matchless), in addition to making the fastest time, won on formula, the placings being as follows:

	Time.	Fig. of merit.
1. S. P. Corry (3½ Matchless) ...	29s. ...	42.40
2. P. H. Dods (2¾ New Hudson-Jap)	44⅖s. ...	43.51
3. W. A. Conn (2¾ Humber twin) ...	41s. ...	43.57

DERBY AND NORTH STAFFS. A.C. SPEED TRIALS AT ETWELL, NEAR DERBY, LAST SATURDAY.

A. F. Wellesley Greeves (T.T. Triumph) on the right, winner of two events out of three. A. B. Bennett, the club secretary, is seen on the left astride his twin Brough.

Streatham and District M.C.C.

A trip to Ostend and Bruges is being held at Whitsun. The open speed trials have had to be cancelled, no course having been found suitable for the event.

Taunton and District M.C.C.

Owing to the recent decision of the Cycle and Motor Cycle Manufacturers' and Traders' Union, the hill-climb arranged to take place on Cothelstone to-day (the 16th inst.) has been indefinitely postponed and a hidden treasure hunt will take its place.

Doncaster and District M.C.C.

A paperchase was held on the 9th inst., in which twelve competitors took part. The hares (E. Goult and E. R. Scott) were caught fifteen minutes after they arrived at their destination. A good trail was laid with confetti over a very hilly course. C. Barnsdale (3½ h.p. Rex) and G. Brenchley (A.J.S.) divide the prize.

Wimbledon M.C.C.

This club held its first reliability trial on the 4th inst. The course was from Wimbledon to Hastings and back, including Westerham and Titsey Hills. The results are as follow:

Solo machines.—1, E. P. Lyon (3½ h.p. Triumph); 2, F. C. Neave (2¾ h.p. Douglas); 3, C. Stacy (3½ h.p. Kerry-Abingdon); 4, G. Cann (3½ h.p. Bradbury).

Sidecar Class.—1, E. Vallis (5-6 h.p. Clyno); 2, B. Williams (4 h.p. Matchless three-speed).

Leeds M.C.C. Hill-climb at Beulah Hill. Scene at the start (see last week's issue.)

Derby and District M.C.C.

The result of the reliability trial held on the 8th inst. was: 1, E. Horton (3½ h.p. Horton); 2, W. Cragg (3½ h.p. Singer).

Cork and District M.C.C.

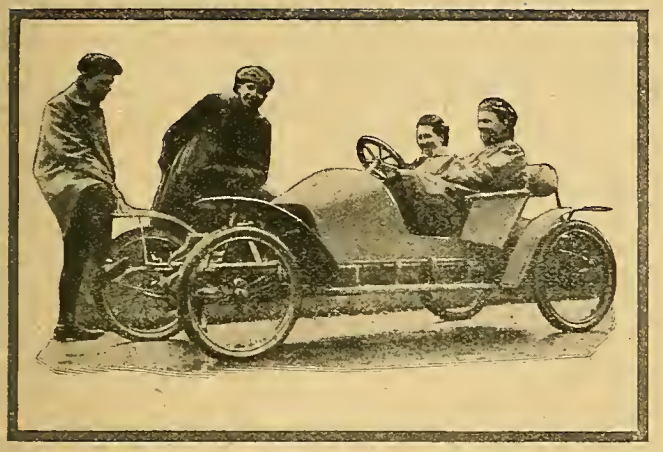
The run off between the six riders who gained full marks in the Pohlmann Cup competition trial took place on the 8th inst. over a secret course of 38½ miles, speedometers and watches barred. There were six checks. Result:

	Total variation.
1. R. S. Russell (3½ T.T. Matchless) ...	5m. 30s.
2. W. J. O'Callaghan (3½ Zenith and sc.)	7m. 15s.
3. L. Dobbin (8 Matchless)	8m. 0s.
4. P. A. Egan (3½ T.T. Bradbury) ...	10m. 30s.

Russell also wins the Hutchinson Tyre Co.'s prize for best performance by an amateur, and O'Callaghan the special sidecar prize.

Burnley A.C.

The results of the hill-climb at Crown Point were:



Class 1 (lightweights).—1, J. Hebden (2¾ Humber); 2, A. Clegg (2¾ N.S.U.).

Class 2 (members' class).—1, W. Simpson (3½ Rudge); 2, R. Winterbottom (3½ Rudge).

Class 3 (open class).—1, R. Winterbottom (3½ Rudge); 2, J. Hodkinson (3½ Precision).

Class 4 (open unlimited).—1, C. Smith (8 Matchless-Jap); 2, J. Hodkinson (3½ Precision).

Smith made the fastest time of the day, climbing the gradient of over half a mile in 35s. There was about sixty entries for the hill-climb, and over 1,000 spectators.

The Buck cyclecar which was out for the first time at the Notts Hill-climb at Hardwick. It is fitted with a Buck 8 h.p. twin engine (fan cooled), Buck two-speed gear, bevel drive, light back axle, Amac carburetter, and has ball bearings to most moving parts and automatic lubrication to the engine. The bonnet was not completed in time for the hill-climb.

Armagh and District M.C.

This club, which now has a membership of sixty-five, held a successful run to Newcastle Co. Down. The captain is Mr. D. H. McDowell, and the hon. secretary Mr. S. S. Sloane.

Fulham and District M.C.C.

A motor cycle club is being formed under the above title. The club is already assured of considerable support. Full particulars will be gladly sent to anyone interested by Mr. F. E. Morse, 76, Bishop's Road, Fulham, S.W.

Birmingham M.C.C.

The second annual competition for the Lycett Trophy will take place at Whitsuntide, the 25th and 27th inst. The route is to be *via* Cheltenham, Stroud, Bath, Shepton Mallet, Taunton, Exeter, Moreton Hampstead, Two Bridges, Tavistock, St. Austell, Truro, Redruth, Penzance, and Land's End. The schedule will be 20 m.p.h., and for passenger machines under 5 h.p., 18 m.p.h. Intending competitors should write at once to the Union Hotel or Perrow's Hotel for rooms, as the hotels in Penzance are likely to be very full at Whitsuntide.

Putney and District M.C.C.

A good entry was obtained for the reliability trial at Worthing, the winners being:

	Total error.
T. F. Agar (6 Zenith)	31½s.
F. R. Tillman (6 Zenith and sc.)	32⅝s.

Members are reminded that a tour to the Wye Valley is fixed for Whitsuntide.

Derby and District M.C.C.

Speed-judging trials were held on the 4th inst., starting from Dalbury Lees. Rain poured ceaselessly the whole of the afternoon, and no doubt this accounted for only a small number turning out. The result of the trial was a win for the secretary, A. B. Bennett (6 h.p. Brough); second, A. L. Spriggs (3½ h.p. Bradbury).

Purley and District M.C.C.

The hill-climb at Pebblecombe attracted thirty-seven entries. The results were as under:

Class 1. Lightweights up to 350 c.c.—1, L. F. Ebbutt (2¾ Humber); 2, S. J. Tayler (2½ A.J.S.).

Class 2. Touring and T. T. Machines up to 600 c.c.—1, H. E. Startin (Ivy-Precision); 2, V. Tomkins (Rover); 3, R. W. Gaskins (Rudge).

Class 3. Multi-cylinders up to 1,000 c.c.—1, L. F. Ebbutt (2¾ Humber); 2, C. M. Webster (8 Matchless).

Class 4. Passenger machines up to 1,100 c.c.—1, T. L. Kemp (6 Zenith and sc.); 2, D. H. Ebbutt (A.C. Sociable).

Class 5. Any machine ridden in one of the previous classes.—1, H. E. Startin (Ivy-Precision); 2, E. M. Oliver (Trinmph); 3, H. B. Willoughby (Rudge).

Silver cup for fastest time, presented by Mr P. J. Collins.—E. J. Webster (8 Matchless)

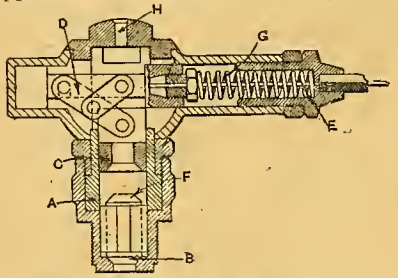
Gold medal (presented by Mr. F. Straight) for best result on *The Motor Cycle* formula $\frac{C \times T^2}{W}$.—H. E. Startin (Ivy-Precision).

North Middlesex M.C.C.

The annual reliability trial to Stratford-on-Avon and back for the Premier trophy was held on the 5th inst., twenty-two of the twenty-eight entrants starting. The course for the outward journey was East Finchley, Hendon, Edgware, Watford, Berkhampstead, Tring, Aylesbury, Bicester, Banbury, Sunrising Hill, to Stratford. From Banbury to Stratford was a non-stop section.

The return journey was Sunrising Hill, Banbury, Buckingham, Bedford, Hitchin, Hatfield, Barnet, to Highgate. From Stratford to Banbury was a non-stop section. The following observations were made on Sunrising Hill: Jennings (Win-Precision), pedalled; Hemy (Service-Jap), failed; Lloyd (Rudge), ran; Parker (N.L.G.), failed; Hilger (Premier), ran; Porterfield (Triumph), stopped with sooted plug; Carodus (P. and M. and sc.), failed. Other ascents were good, Bennett (Norton) and Fletcher (Douglas making fine performances.

The awards are as follow: H. C. Mills (3½ h.p. Premier), Premier trophy and medal. Silver medals: Noble (Rover), Jennings (Win-Precision), Lambert (Chater-Lea and sc.), Dangerfield (Premier), Bennett (Norton), A. Cass (Quadrant), and Miss Hammett (Douglas). Bronze medals: Fletcher (Douglas), Lloyd (Rudge), and Carodus (P. and M.). Mills wins the trophy for the second year in succession.

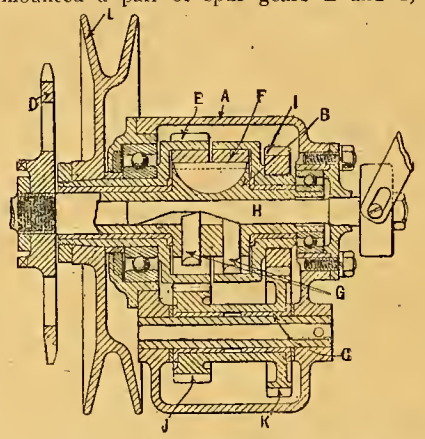


A fancy dress run and competition will be held on Saturday, June 1st, starting from Ye Olde Gatehouse, Highgate, at 3 p.m. This will be open to any motor cyclist, and awards will be made to competitors having the most original costume relative to the motor cycle.

MOTOR CYCLISTS EMPLOYED IN THE CAR INDUSTRY. Group of members of the Daimler M.C.C. at the start of the opening run to Leicester on the 4th inst.

The Amac Decompressor.

This decompressor is arranged to screw into a valve cap or other convenient aperture in the cylinder. Within the body A is arranged a fixing seat B and a seating C, which is movable by means of the irreversible toggle mechanism D and Bowden cable E. Between the seatings A and B is arranged a double-faced valve member F. When the movable seating C is allowed to be moved by the spring G into its lowest position, the movable valve member F is forced down on the seating B closing the passage, the irreversible toggle mechanism preventing accidental movement of the parts. When the Bowden mechanism is operated to raise the movable seating, the compression of the engine causes the movable valve F to travel from the seating B until its opposite face comes into contact with

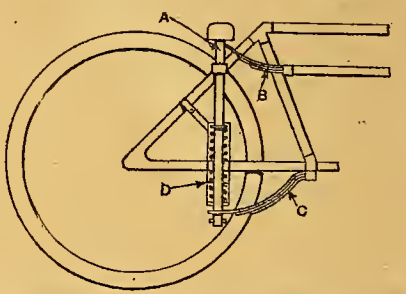


the seating C, and during this time a portion of the gas being compressed in the cylinder is allowed to escape past the seating issuing from the aperture H, and so relieving the compression with the well known advantages.—F. H. de Veulle, No. 13,953, 1911.

PATENTS

by Eric W. Walford A.C.I.P.A.

A Two-speed Countershaft Gear.



Within a casing A is arranged a shaft B and a layshaft C. Motion is transmitted from the engine to the chain wheel D driving the shaft B upon which are mounted a pair of spur gears E and I,

which are carried by drums, within which are arranged expanding brake bands F. These brake bands are operated by suitably shaped segments G, operated by incines on a movable rod H. The spur gears E and I gear with corresponding wheels J and K on the layshaft C, and the wheel E is positively connected to the belt-driving pulley L. In operation, when the brake band holding the gear wheel E is expanded, the motion is direct from the shaft B to the gear E, and thence to the belt pulley L. To obtain a reduced gear the brake band wheel F is released, and that holding the gear wheel I is operated. Motion is now from the chain wheel D to the shaft B, thus driving the gear wheel I, thence to the layshaft gears K and J, and from J to the gear wheel E, again rotating the pulley L, but at a reduced speed.—The Minstrel and Rea Cycle Co., Ltd., and G. W. Hands, No. 5,927, 1911.

An Anti-vibratory Seat Support.

The drawing illustrates a method for carrying the seat supporting pillar A by means of a pair of laminated springs B C,

supplementary spiral springs D being employed to take the lighter shocks.—F. A. E. Nicholson, No. 15,359, 1911.

Change of Address.

Owing to the demand for Stewart magnetic speedometers the Cooper Stewart Engineering Co. have been compelled to remove to larger premises at 11, Broad Street, Bloomsbury, W.C.

Boscombe Garage.

An up-to-date garage recently opened at Boscombe, on the main road from Christchurch to Bournemouth, is Messrs. Hart and Lord's, where motor cyclists will receive every attention at moderate charges.

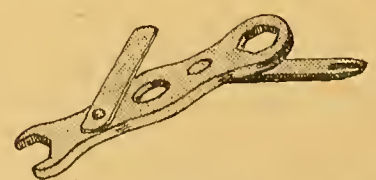
Inner Tube Specialists.

The Standard Rubber Co., Berner's Place, Berner's Street, W., are making a speciality of inner tubes for motor cycles of the highest possible grade. They are constructed of almost pure Para rubber, are black in colour, and of great strength and elasticity. Though of ample thickness they are not heavy.

A Successful Lightweight.

The lightweight Alcyon, which did so well in the various trials and competitions during last season, has been considerably improved for this year. The machine is now fitted with wider and more substantial mudguards, with side flaps to the front mudguard, stronger carrier, rubber covered foot-rests, a new frame, and a larger silencer. A Claudel-Hobson carburetter is fitted. This carburetter is, we understand, most successful and renders the engine extremely flexible. So much so that the machine can be easily turned round in the width of an ordinary road with the engine firing.

SPARKLETS



Pillion Seats.

The Michell pillion seat mentioned by Mr. R. T. Adams in the Correspondence columns of the issue of May 2nd is now known as the V.M. tandem seat. It is supplied by C. F. Michell and Co., 17, Wormwood Street, E.C.

A Fibre Bush Reamer.

A few weeks ago we suggested that a small reamer might be supplied with advantage by magneto makers for sizing the hole in the fibre bush of the contact breaker to enable the fulcrum to work freely in the bush when the latter has swollen through damp. The Simms Mag-

neto Co., Ltd., Welbeck Works, Kilburn, N.W., acting on our suggestion have sent us a small reamer embodied with the usual magneto gauge and spanner. These they are ready to supply to anyone who needs them at a very small cost. Our sketch of the tool renders further explanation unnecessary.

Trial of a New Plug.

We have had one of the new type Forward plugs in use for the last week or so. This plug has a bent over central wire, which projects through a ring in the centre of the earthed electrode. This plug has been quite satisfactory in every way; it does not soot up, and so far we have not found it necessary to remove it from the cylinder.

Catalogues Received.

The Service Co., Ltd., 292-293, High Holborn, W.C., were one of the earliest firms to publish a catalogue specially for motor cyclists. Their latest production is a bulky work which consists of no less than 224 pages. In it there are 1,000 illustrations and over 4,000 articles separately enumerated. The catalogue deals with complete machines down to the smallest accessory. Valuable hints to those about to buy machines are embodied in the preface entitled "Selecting a Motor Cycle."

A new Simms plug. The chief novelty is in connection with the shape of the electrodes. The central wire is round and the earthed electrodes are semi-circular at the ends, so providing a correct gap which forms almost a continuous circuit of the central wire.

IDEAL

**FOR ALL AGES, ALL ROADS,
ALL CLIMATES, ALL WEATHERS.**

A silent machine, unfailing in its reliability, and remarkable for its efficiency, as comfortable as an armchair, and so economical on tyres, petrol, and oil, that it proves a revelation after the use of other machines.

W. T. DONAGHADEE writes:
"I have had your Motor Cycle Voltalite for some time now, and have had it fitted to my motor cycle in order to test same. I may say it is quite a success and it ought to be the leading Motor Cycle Lamp of the future."

NO OIL - NO BATTERIES - NO MATCHES

The Voltalite Motor Cycle Lamp is made on similar lines to the Voltalite Cycle Lamp which has been so eminently successful for many years. It makes its own Electricity by the movement of the cycle at walking speed upwards—full brilliancy is attained no matter what speed, the same light is stationary. **Price complete, £2 12 6.**

Send for our M. & E. Catalogue also special pamphlet relating to the Voltalite with report from "The Motor Cycle" explaining the working of this wonderful lamp.

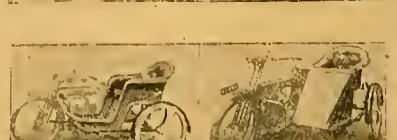
MAUDE'S BARGAINS

IF you want a Second-hand Motor Cycle—

GET IT AT MAUDE'S.



No pig in a poke business about us. You may know what you are buying, and we GUARANTEE even our SECOND-HAND MACHINES. That's worth bearing in mind. Nothing is too much trouble to satisfy you, and you may have the satisfaction of knowing that the price you pay is the very lowest limit at which such a machine could be obtained. We are cheaper than private advertisers, and we are always here if you want us. That's another useful point to remember. Here are a few—

ALL GUARANTEED.

HUMBER, 1911, 2-speed, splendid condition, £37/10, with sidecar £42; 1911 Humber lightweight, as new, £25.—P. J. Evans, 358, Stratford Rd., Birmingham.

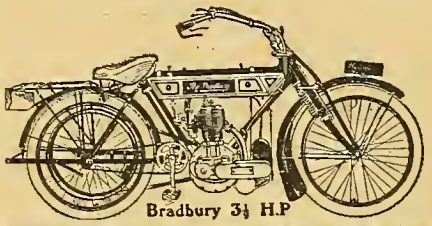
DOUGLAS, 1910, standard, £24; 1911 standard, £28/10; both guaranteed perfect.—P. J. Evans, 358, Stratford Rd., Birmingham.

1912 Rudge, F.E., lamp, generator, tools, and spares, ridden 3 weeks; selling through illness; £45.—Hart Davies, Southam.

IVY-PRECISION, 1911, 3½h.p., Dunlops, perfect condition; £27/10, complete with spares.—77, Edward's Rd., Erdington

TRIUMPHS, one 2-speed and one direct drive, both perfect; bargains.—James Allday, 11, Vernon Rd., Edgbaston, Birmingham.

1911 T.T. Roadster Triumph, superb condition, new back cover; nearest offer to £40, or £46 with sidecar.—Rev. P. W. Bischeff, 1, Kerr St., Northampton.



1912 Precision, with or without sidecar, enclosed magneto, variable jet carburetter, only used a few miles, complete; £38.—162, Summer Lane, Birmingham.

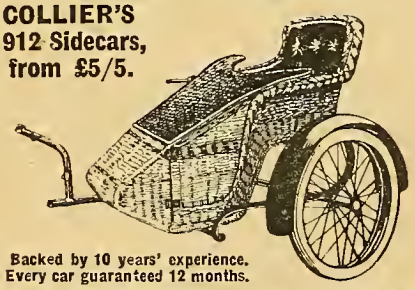
Collier's Motories,
Westgate, Halifax,
ENGLAND.

1912 BRADBURYS.
THE IDEAL SIDECAR MACHINES.

The greatest power in single-cylinder machines, giving maximum efficiency and freedom from attention.

3½ h.p. Tourist Models £48
3½ h.p. 2-speed BRADBURY £55
3½ h.p. 3-speed BRADBURY £58

Bradbury 3½ H.P



Exchanges Quoted. Distance no objection.

SECOND-HAND MACHINES.
—CASH, EXCHANGE, OR EASY PAYMENTS.—

1910 2-speed **SCOTT** £37 10
1912 3-speed **NEW HUDSON**, only had road tests £49 10
1911 Twin 2-speed **REX DE LUXE** £47 10
6 h.p. 2-speed Twin **ANTOINE**, Druids, as new.... £35 0
1911 3½ h.p. Tourist **REX**, new and unused ..... 34 gns.
5 h.p. 2-speed free-engine **ROC** £29 10
1910 7 h.p. Twin **REX**, M.O.V. £37 10
Magneto **TRIUMPH**, spring forks, very smart.... £23 10
Magneto Twin **REX**, new and unused ..... 33 Gns.
REX, 1909, 3½ h.p., spring forks, h.-b. control .. £24 10
4½ h.p 4-cylinder **F.N.**, magneto £19 19
2¾ h.p **KERRY**, runs well, spring forks £10 10
1910 3½ h.p. T.T. **REX**, very fast £27 10
2¾ h.p. **DE DION**, spray carburetter £10 10
1911 3½ h.p. 2-speed **N.S.U.**, spring frame..... £35 0
3 h.p. **HUMBER**, chain drive £7 10
1911 3½ h.p. Magneto **REX**, spring forks..... £29 10
2¾ h.p. Magneto **MINERVA** £16 10
1910 3½ h.p. **REX**, brand new, spot cash, bargain £29 10
1910 New Twin **REX**, Cantilever seat ..... 35 Gns
1910 Twin **REX DE LUXE** and sidecar £45 0
MOTO-REVE, magneto, Druids £19 19
1910 **ROYAL ENFIELD** Lightweight, very smart £22 10
2½ h.p. **J.A.P.**, spring frame, h.-b. control..... £9 10
3½ h.p. Light Low **REX**, h.-b. control..... £12 10
1911 3½ h.p. Tourist **REX**, 100 miles only £32 10
1911 Single-cylinder 2-speed **REX**, 300 miles £37 10
5½ h.p. Twin **REX**, spring forks £16 10
2¾ h.p. **ALCYON**, wants slight attention £6 10
3 h.p. **M.M.C.**, special finish..... £10 10

A CALL WILL REPAY YOU.

COLLIER'S 1912 Sidecars, from £5/5.

Backed by 10 years' experience. Every car guaranteed 12 months.

"Popular" Chipper or Continental tyre £5 5 0
"Superbe" type, with best tyre, apron, etc..... £6 6 0
Side-entrance body, as illustrated £7 10 0
Ditto, with best coach-built body £7 12 6

Improved Quick Detachable Joints, Cranked Extra Strong Back Axle and Spindle to all models. Prompt delivery to suit Rexes, Triumphs, N.S.U.'s, Indians, and any other make.

Discount to Trade Exchanges entertained.

1911 **Brand New Tourist and de Luxe REXES from Stock. Liberal exchanges in addition to special Cash Discount.**

MOTOR BICYCLES FOR SALE.

J.A.P., 2½h.p., Chater frame, low, B. and B., new dry battery, climbs well, perfect running order; £12.—32, Manor Rd., Rugby.

9h.p. Bat-Jap, everything in perfect order; price £32; full particulars on application.—Williamson, St. George's Sq., Stamford.

£7.—Humber, 3h.p., just bored and re-bushed, B. and B., h.b.c., good tyres, new belt.—Glenroy, Wake Green, Moseley, Birmingham.

2½h.p. Rex Lightweight, Bosch magneto, in good running order; £16, or near offer; exchange considered.—11, Conway Rd., Leicester.

2¾h.p. De Dion, low frame, long handle-bars, B. and B. carburetter, h.b.c., good condition; £8.—Beckham, Hallaton, Uppingham, Rutland.

1911 Humber, 3½h.p., 2-speed, sidecar, Cowey, lamp, generator, horn, whistle, only used 2,300 miles; owner gone abroad; £45.—Plastow, Grimsby.

PLASTOW, Grimsby, has the following new F.E. and multi-speed models in stock: Triumphs, B.S.A.'s, Rudges, Premiers, Bradburys, and Humbers, for immediate delivery.

PLASTOW, Grimsby, has the following second-hand machines for sale: 3h.p. Griffin, £6; 3½h.p. Minerva, £9; 1¾h.p. Clement-Garrard, £8; 3½h.p. Chase, £10/10; 2¾h.p. Fairy, Bosch magneto, £12/10; 1908 Triumph, £24; 1909 Triumph, £26; 1910 F.E. Triumph, £37/10; 1911 Standard Triumph, ridden 1,200 miles, £40; 1911 F.E. Rudge, only ridden 1,800 miles, £43; 1911 2¾h.p. Hobart, £27; 1912 2¾h.p. Premier, run 100 miles, £33.

SCOTT, 3½h.p., 1911½, new Palmer tyres and chains, all necessary spares and tools, spleadid condition throughout, in perfect tune; £45.—W. Pennell, Swallowbeck, Lincoln.

REX, 1911, T.T., 3½h.p., very speedy machine, Druid forks, Bosch magneto, B. and B. carburetter, in first-class order throughout; £25.—G. Peace, Esrlsdon St., Coventry.

LADY'S 2¾h.p. J.A.P., just overhauled by makers, splendid condition, magneto; selling through illness; £25.—Box L6,992, *The Motor Cycle* Offices, 20, Tudor St., E.C.

REX De Luxe, 5-6h.p., twin-cyl., free engine, 2 speeds, Bosch magneto, spring forks, fitted with coach-built sidecar; sell turnout £36.—Brown's, 12, Bull Ring, Birmingham.

DOUGLAS Motor Cycle, 2¾h.p., magneto ignition, spring forks; sell, bargain, £22/10.—Brown's, 12, Bull Ring, Birmingham.

REX, twin-cyl., 5-6h.p., 1910 model, free engine, Palmer tyres, spring forks and seat pillar; sell, bargain, £32.—12, Bull Ring, Birmingham.

TRIUMPH Motor Cycle, 3½h.p., magneto, Dunlop and Michelin tyres; bargain, £28.—12, Bull Ring, Birmingham.

PRECISION, 3½h.p., 1912 model, Bosch magneto, Druid spring forks, Palmer tyres, lamp, horn, etc., as new; bargain, £32.—12, Bull Ring, Birmingham.

BRADBURY Motor Cycle, late 1911 model, free engine, 3½h.p., excellent condition; sell, bargain, £38.—12, Bull Ring, Birmingham.

SPEED King Rex, 3½h.p., m.o.v., 1911 model, magneto, very fast; bargain, £24.—Brown's, 12, Bull Ring, Birmingham.

F.N., 4-cyl., magneto, spring forks; bargain, £16.—Brown's, 12, Bull Ring, Birmingham.

INDIAN, red, 1910 model, 5h.p., free engine, spring forks; sell £32.—Brown's, 12, Bull Ring, Birmingham.

1911 Bradbury, 2-speed and free engine, and side car, lamp, horn, spare belt and valves, good condition; any trial; £48. — Tomkins, Cotton End, Northampton.

REX, 3½h.p., accumulator ignition, Dunlop 26in. × 2in., heavy tread, and Bates ditto front tyres, spring forks, good order; photo.—Apply, Blake, Mill Lane, Kirkstead, Lincs.

FOR Early Delivery of Triumphs, Premiers, Rovers, Humbers, Singers, Rudges, Rex, and Clyno, order from the man on the spot, Brandish, motor agent, Foleshill Rd., Coventry.

B.S.A., 2-speed and clutch models in stock; why wait for delivery; first cheque secures one of these famous monats.—Official agent, Newell, Lozells Rd., Aston, Birmingham.

3½h.p. Rex, 1910, reliable and fast machine, Lucas lamp, N'all saddle, all spares, including cover and tube, both tyres as new; £25. — E. Turner, The Grove, Sutton Coldfield.

TRIUMPH, 1909, fixed engine, standard specification, good condition and appearance, guaranteed throughout, what offers? also 1910 2¼h.p. twin Enfield lightweight, Palmer cord tyres, Brooks saddle, khaki, used 600, guaranteed; approval either.—Holt, Motors, Leamington.

NO. 7 Chater-Lea and Sidecar, J.A.P. engine, 8h.p., 3 speeds, 800×80 car tyres, only done 2,800 miles, complete, speedometer, watch, lamp, horn, 3 spare tyres; £80/10; any trial given; can be seen any time, Sunday included.—Alfred White, 162 and 163, Summer Lane, Birmingham.

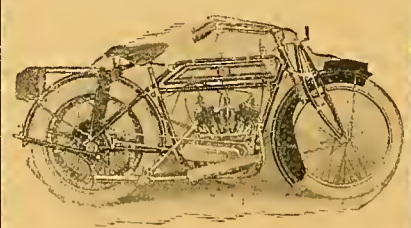
WE CAN DELIVER

FROM STOCK

the following new 1912 Motor Cycles:

TRIUMPH (Free Engine).
ZENITH-GRADUA, 6 h.p.
INDIAN, 7 h.p., two-speed.
N.S.U., 3½ h.p., two-speed.
REX (all models).
HUMBER, 3½ h.p., two-speed.
HAZLEWOOD, 2¾ h.p., three-speed.

We carry a complete range of Lucas Lamps, Miller's Lamps, Cowey Speedometers, etc., and can equip the machine to your own specification without any delay.



Exchanges or Easy Payments.

List of Second-hand Motor Cycles free upon request.

The Premier Motor Co., Ltd.,

Aston Road, BIRMINGHAM.

Telegrams: "Primus," Birmingham.
Telephone: Central 4310.

MOTOR BICYCLES FOR SALE.

1912 N.S.U., 3h.p., twin, free engine, 2-speed, brand new, advertiser paid £5 deposit, cannot take delivery, unforeseen circumstances; will sacrifice deposit.—217, Heathfield Rd., Handsworth, Birmingham.

RUDGE, 1911, April, free engine model, mileage 1,855, new Dunlops and belt recently fitted, good appearance, very powerful, guaranteed perfect throughout, spares: £40; approval.—68a, Regent St., Leamington.

TRIUMPHS, 1910 T.T. roadster, all racing equipment, Triumph-Gradua, Millford sidecar, both recently overhauled (Triumphs), perfect order; genuine bargains.—Details, Box 512, *The Motor Cycle* Offices, Coventry.

1911 Model de Luxe Rex, 5h.p. twin, free engine, 2-speed, perfect sidecar machine, practically new, only ridden a few hundred miles; too powerful for owner; cost £63, sacrifice £42.—54, Lozells Rd., Birmingham.

TRIUMPHS.—Five good second-hand Triumphs, also one 1911 unused, one free engine, and one 1912, one standard, all ready for immediate sale, from £25.—Call or write, Colmore Depot, 49, John Bright St., Birmingham.

SECOND-HAND 3½h.p. Machines, in good condition: Humber, Premier, Arial, Bradbury, Zenith, Macbeth-Armstrong (3-speed); one of each of these in stock, ready, inspection requested; prices from £25; all good machines.—Colmore Depot, 49, John Bright St., Birmingham.

SECOND-HAND Big Twins for Sidecars, all very powerful machines: Vindec, Scott, Chater-Lea, N.S.U., Rex; one of each of these for sale, some ready, some being overhauled; call and select one.—Colmore Depot, 49, John Bright St., Birmingham.

SECOND-HAND Lightweights, the handy and economical type of mounts, in stock, some 1910 and 1911 Douglas machines, also a 2¼h.p. Enfield, 2¾h.p. Enfield, a Moto-Reve, and a Motosacoche; price £16 to £30.—Colmore Depot, 49, John Bright St., Birmingham.

SCOTT, 1910, 3h.p., price £36; or with sidecar £39.—Colmore Depot, 49, John Bright St., Birmingham.

F.N., two, special, 4-cyl., shaft-driven, the F.N. special, smooth running machines, 5h.p., solo or sidecar. — Colmore Depot, 49, John Bright St., Birmingham.

WOODGATE, for immediate delivery of all models of Singers, Triumphs, Enfields, Rudges, and Ariels, and Canodet and J.J.W. sidecars; also for a splendid range of second-hands, varying from £5 to £45. Get my prices and save money; exchanges and payments arranged. — J. J. Woodgate, the Motor Cycle Depot, Small Heath, Birmingham. 'Phone: 372 Victoria.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

CHIEF Triumph Agents for Cambridge (early deliveries), King and Harper, Cambridge.

1909 Triumph, in real good order, all spares; £24.—37, Searle St., Cambridge.

ALLDAYS Motor Cycle, 2¾h.p., carrier, etc., not heavy; cash only, £5.—Bailey, jeweller, Soham.

TRIUMPH, 3½h.p., 1910 free engine, very fine condition, flexible engine; £35. — Bailey, jeweller, Soham.

BRADBURY, 1911, standard, just through from works, plate, enamel unscratched; £35.—Bailey, jeweller, Soham.

BRADBURY, 1912, free engine, slightly soiled; cash only, £50, no offers.—Bailey, jeweller, Soham.

1911 3½h.p. Premier, delivered June, excellent condition, very little used; £35.—Bird, Harrold, Beds.

TRIUMPH, F.E., in stock, also 2-speed B.S.A.'s, 2-speed Humbers, Bradburys, etc.—Lambert, Thetford.

1911 T.T. Triumph Roadster, condition equal to new, Dunlops, horn, mirror, spare valve; £43.—Parker and Son.

1911 F.E. Quadrant and Sidecar, shop-soiled; absolute bargain, £53.—Parker and Son, St. Ives, Hunts.

LADY'S Royal Enfield, 1912; £45; owner getting higher powered machine.—Ackroyd, Pemberley Av., Bedford.

NEW Hudsons; delivery from stock.—Sole agents for Suffolk, T. H. Nice and Co., Bury St. Edmund's, and Ipswich.

PREMIERS, all models; delivery from stock.—Suffolk agents, T. H. Nice and Co., Bury St. Edmund's, and Ipswich.

TRIUMPHS, Humber, Bradbury, B.S.A., Rudge, new and second-hand, also sidecars.—T. H. Nice and Co., Bury St. Edmund's, and Ipswich.

TRIUMPH, 1912, clutch model, scarcely soiled, Garner whistle, etc.; £50, no offers. — Stevens, Lopham, Thetford.

MINERVA, 2¾h.p., magneto, spring forks, Amac, adjustable pulley, Brooks saddle; £12/10.—B. Jones, Downham, Norfolk.

LATE 1910 8h.p. Twin Bat-Jap, free engine, Dunlop tyres almost new, engine is perfect; £34. — 3a, Bridge St., Cambridge.

Should Ladies be Allowed to Race?

RECENT events have helped to strengthen an opinion we had formed that racing uphill and round corners at breakneck speed is not a pastime recommended for a lady. The straightforward reliability trial with an occasional steep hill included certainly must appeal to the sporting type of lady motor cyclist, and further one cannot but admire the pluck and courage of a lady who is willing, nay anxious, to try her prowess in a speed event, but many, we fear, are little aware of the risks they run, and how near on several occasions they have been to a severe accident. We will ignore for the moment the question of whether it is becoming or not for a lady to be spread-eagled on a speed machine of any kind. Fortunately, we shall not be excluding a large section in pleading that ladies be henceforth debarred from speed events, and we do so in the best interests of the sport and pastime. When one thinks the matter over, should the governing body be agreeable to adopt our recommendation, it would not be taking the lead but merely following the example of the parent body, the Royal Automobile Club, and also of the Brooklands Automobile Racing Club. The average lady is not possessed of the self-restraint, or presence of mind, which a man can command, and we know we have many supporters in recommending that ladies be discouraged from taking part in speed events. Pondering over this year's events alone, we can recollect having seen three ladies experience severe falls, and a case of another accident this month has come to our ears. Instead of benefiting the pastime this sort of thing is proving a serious deterrent to converts, and the sooner our recommendation is adopted the better for all concerned. The ban is not intended to discourage the use of the motor cycle among ladies for touring purposes; on the contrary, more converts might result so soon as the frequent reports of accidents cease.

Holiday Rides.

IF the weather be propitious there will be a very large increase in the number of motor cyclists on the road this Whitsun holiday, and a big proportion of them will be first year riders. The increased traffic on main roads, and particularly in the neighbourhood of populous centres, renders it necessary to impress on all motor cyclists the desirability of exercising caution, particularly at cross-roads and corners. We say *all* motor cyclists, because the most experienced rider is not proof against accident when he is using the same roads as the novice, who, unaccustomed to the speed of a motor cycle, and not knowing the rules of the road so well, may issue from a by-road at a dangerous pace, and the expert rider, unless he be reasonably cautious at crossings, may find himself the victim of an accident through no fault of his own. It should be made illegal to enter a main road from a by-road except at a crawl, and although it is sometimes difficult to differentiate between main and other roads, the trunk route is usually fairly apparent. There is, however, little or nothing to fear if reasonable care be exercised.

Novices should ascertain before starting on a lengthy ride that every detail of the machine is in perfect order, and take care they are properly clothed. The season is a changeable one, and chills are easily caught. Goggles, too, are absolutely necessary to protect the eyesight.

Hill-climbing Formulæ, Old and New.

$\frac{C \times T^2}{W}$ recommended by "The Motor Cycle."

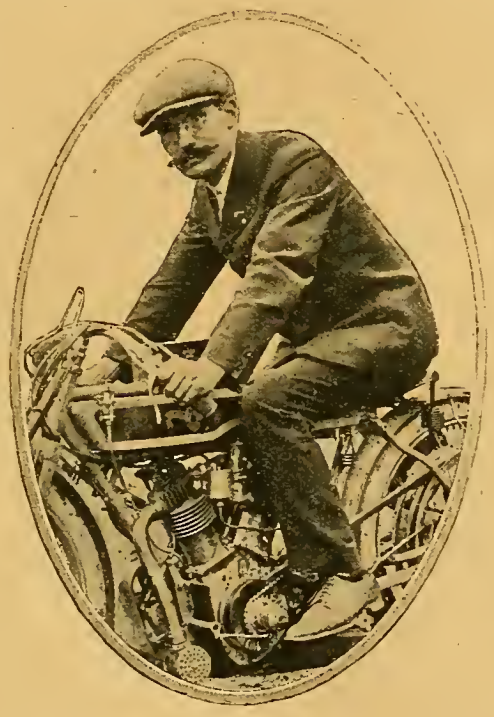
YEARS ago, when the speed of motor cycles was much less than it is at present, the A.C.U. formula $\frac{W}{C \times t}$ gave a fairly approximate result. We say "fairly" advisedly, because a formula which assumes that if the weight of a machine and rider is halved, the time is also halved, or that the speed can be doubled by doubling the horse-power, can never be more than approximate; but when the speeds were low in comparison with what they are to-day, and wind resistance had not so great an effect in consequence of these lower speeds, then the A.C.U. formula was sufficient. Nowadays, however, when speeds are high and wind resistance plays an important part, riders have discovered the weakness of the A.C.U. formula and the advantage of carrying extra weight, and often the fastest performance comes out low on formula. Hence the need of a revised formula to meet the newer conditions that at present obtain.

Points to be Considered.

If the weight lifted in climbing the hill were all that had to be considered it would be reasonable to include t in the formula, and the same applies to road resistance, which varies as the weight, but air resistance varies as the square of the velocity, and the horse-power required to overcome this varies as the cube of the velocity; hence we recommend the inclusion of t^2 (time squared) as a simple means of striking a fair average. The inclusion of t and t^3 is perhaps more scientific, but more complicated, and we showed last autumn, when discussing this question, that the formula which we recommended, and which was used by the Streatham and District M.C.C. at its hill-climb at Brasted about a fortnight later (the first time, we believe, that this formula was used for a British hill-climb), gave results which differed only infinitesimally from the more complicated formula, containing both powers of t, suggested by a correspondent. The formula recommended by this journal has since been used in a number of important hill-climbing competitions, and is likely to come into general favour.

Other Alternatives.

Some clubs, especially those in Scotland, prefer to use $t^{1.5}$ or $t^{1.3}$, but these values are not only much more difficult to calculate, but, in our opinion, the results are not so satisfactory. This opinion is corroborated by the fact that a competitor in a recent hill-climb where $t^{1.5}$ was used considered it advisable to attach 50 lbs. of lead to his crank case with the object of coming out well on formula. He overdid it, however, and failed on the hill, so his case does not point the argument as well as it might. To prevent the addition of extra weight one club (again the Streatham and District) has fixed weight limits in the various classes, and allows no credit for weight carried beyond that amount, though it does not disqualify machines that exceed this weight limit. This is another excellent plan, but we think that it makes a mistake in fixing the lightweight c.c. limit at 340, seeing that 350 c.c. is the Tourist Trophy limit as well as the Class B limit at Brooklands, and that the 340 c.c. limit excludes one or two well-known machines (among others the Royal Enfield, the new T.T. Douglas, and the Forward).



The sort of trick hill-climb the Motor Cycle Manufacturers' Union is objecting to. The event took place on Roper's Hill, Redmires, and was organised by a new Sheffield organisation, viz., the Sheffield University M.C.C. The motor cyclist in the act of falling is H. Hart-Davies (twin Rex).

My Most exciting Ride: No. 1. HARRY A. COLLIER.

Interrogated by L.C.

WHEN I interrogated the elder of the famous brothers, who are perhaps the best known motor cyclists in the world, he began to meditate, and gave me some interesting motor cycle history before he arrived at that event which provided the most exciting ride he had undertaken. The Colliers are essentially careful riders, and the fewness of their mishaps bears testimony to this. Harry Collier's first machine was a De Dion "quad," which he rode in 1899, and it was not until four years later that he began competitive riding. The eliminating trials for the International Race of 1905 saw him placed second, but still his riding was singularly uneventful. In 1906, however, he had an experience which he reflects upon with thankfulness for his immunity from an accident. After being chosen to represent England for the international race in Austria, he journeyed across to Patzau, where the big race was to begin. The course was over a road which had been primarily designed for oxen, and on the one side was a steep precipice, except for an interval of some miles, when the road ran along the side of a big lake. On the other side, the road was bounded, not by the grass mounds to which English riders are accustomed, but by huge stone boulders, while the road itself was terrible, both in its tortuous descents and in its irregular surface.

During the race, Harry Collier went all out, passing competitors time after time, and keeping to the road by the greatest efforts. All through his nerves were at a tension to which they were entirely unaccustomed, and when he did eventually finish, his first impression was one of relief at having come safely through the ordeal. He occupied third place. One unfortunate competitor hit the rocky side of the road and fell into the lake, breaking both legs and being nearly drowned, while others had accidents which Collier was thankful not to have heard about until he was through with the race. Collier has had some exciting times on road and track in so far as the striving for premier position has been concerned, but he reckons all his rides as child's play compared with that terrible race in Austria.

"What about the Tourist Trophy Races?" I remarked, thinking to recall experiences which had befallen him in Mona.

"I haven't had any excitement over there," said he, "other than the natural excitement of preparing for the event, for on each and every occasion I have started out with the idea of riding as carefully as possible, and consequently it has been nothing more than a somewhat monotonous run round the course at high speed. Charlie and I have always done well over there, but we have done it without excitement or untoward incident. No, the Austrian International Race was the most exciting event I have ever competed in, and I don't want to come across such another test of nerves. Of course, a motor cyclist cannot afford to be on speaking terms with 'nerves,' but on such an occasion as that, where it was a case of being between the boulders and the precipice, one is in a high state of excitement the whole time, especially when the course is unfamiliar."

Opening meeting of the Dutch Motor Cycle Club. Members to the number of forty journeyed from all parts of Holland to Het Loo, the summer residence of H.M. Queen Wilhelmina.

Occasional Comments by "Ixion"

Stripped Threads on Gear Controls.

I should advise all users of multi-speed hubs to keep a very wary eye on the details coupling their control rods to the gear and clutch mechanism protruding from their hubs. Very heavy strains are thrown on these details, and in several instances the screw threads, and indeed the parts generally, are far from being up to their work. When a low gear is in operation the thrust strains and the vibration at these points are often excessive, and heavier fittings are urgently required.

Decompressors.

Why have we heard so little of the new decompressors, which represent an even greater aid to starting than the free engine? Nearly a year has passed since I handled my first sample. It enabled a weakling to walk off a 200 lb. machine at about three miles an hour with a cold and gummy engine, and I thought the standardisation of the device would come immediately, and enormously popularise motor cycles among the non-athletic type of potential rider. One of my chief difficulties in making converts to the sport is the starting trouble, which disappears after a little practice, but is certainly formidable to a nervous novice; but the jumpiest tyro can step courageously on to the footrest of a machine which is just breathing quietly along at three miles an hour. It is much simpler than letting in a clutch with a nervous toe poised on a 5in. pedal of rather crude leverage. I had the opportunity of getting a decompressor fitted to my own 1912 machine, but I refused, as I want the machine for reliability trials, and the makers' slowness in standardising a device of such obvious selling attraction seemed to point to some defect in its present form. I sincerely hope that only the workshop difficulties of modifying engine design were responsible, but I advise my readers to watch the decompressor; it renders the starting of a heavy motor bicycle as easy as the starting of a push bicycle, and engine makers must be blind if they do not see that the decompressor is the most powerful selling factor on which they can concentrate attention.

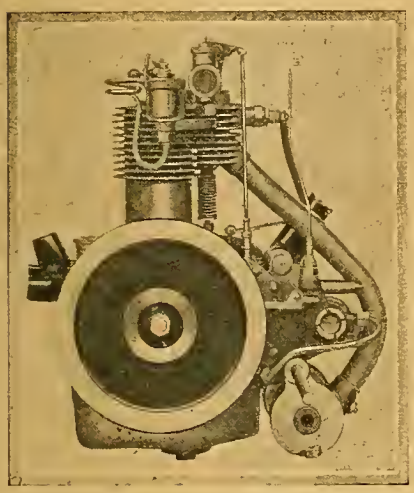
A Warning to the "Knuts."

The desire for pre-eminence takes strange forms. A century ago periwigs, powder, patches, snuff, primrose waistcoats, and duelling were the rage, and Bath was the hub of the universe. To-day, amongst quite a large section of our juvenile male population, Brooklands is the axis of the universe, and not to have an open exhaust, dropped handle-bars, overhead valves, bread-trencher pulley, and gnome-like headdress is to be a back number.

Speed has its usefulness, but the genuine speed merchant is born not made, and the born racing man runs risks that are not enviable, witness the sad death of Arthur Moorhouse and the closing chapter of poor de Rosier's racing career. A good many of our younger riders appear to take it for granted that men of every temperament and mentality can freely indulge in speed on road and track without prolonged previous experience at a moderate pace, whereas many of these dashing riders cannot be trusted to pull up without capsizing if their front tyre burst at a mere 40 m.p.h. Recent events have clearly proved the risks latent in high-speed work even for men of unique skill and considerable experience; and the comparative novice who opens out his new machine to 65 m.p.h. within a week or two of delivery is nothing more or less than a crazy young fool.

Saddle Design.

I have been using a new and very comfortable saddle during the last few months which relies almost exclusively upon front-hinging, so that there is a huge amount of up-and-down movement at its tail. There is no disputing the comfort thus attained, but the design necessitates a high adjustment of the pillar, otherwise the tail of the saddle hits the mudguard or carrier whenever a real bump is crossed, and consequently the saddle design nullifies all the frame-builder's efforts in quest of a low sitting position. Unfortunately for me the front brake connections and steering stem of my new machine are too short for me to obtain a position in which the saddle does not hit the mudguard, as if I raise the saddle I have to leave the handle-bar in a position where it fouls my knees when turning corners.

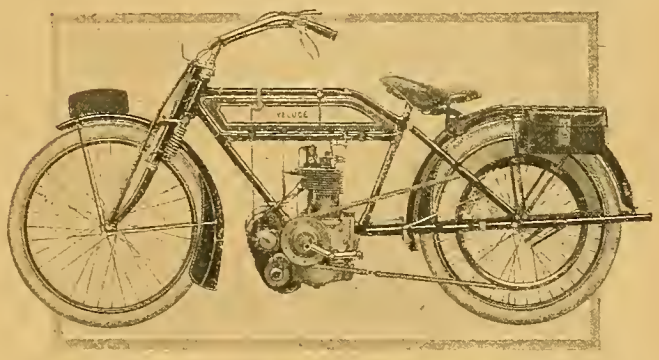


Wanted, some Real Hills.

Ever since I took delivery of a three-speeded 3½ h.p. I have been looking for a hill which could extend the machine on bottom gear. The report of the Coventry and Warwickshire M.C.'s one day trial put me on a new scent, and off I went to investigate, only to meet with disappointment. Provided one was willing to negotiate sharp bends with the machine leaning well over, there was not a hill on this much-belauded course which a well-tuned 3½ h.p. could not tackle on a 5¼ to 1 gear on dry roads; and if one funked the corners and dropped into the third ratio, the merest trifle of throttle opening ensured a safe and comfortable ascent. Sudeley, Saintbury, Birdlip, and Sunrising are easy climbs in dry weather for a single-geared 3½ h.p. with adjustable pulley, and I suppose I must wait for the freak 1 in 3 hairpins to grow anxious on the bottom gear of a three-speed hub.

My experience is that in solo work with a 7 or 8 to 1 gear on a 3½ h.p. the most freakish climbs are straightforward work, provided the rider can remain in the saddle at all, and provided he does not muddle the mixture of a sensitive carburetter when he drops the valve after rounding an acute bend. Hills like Farlow, Tornapress, and both sides of Amulree are rather exercises in steering and carburetter control than tests of engine power, now that variable gears have touched their present standard of evolution

A RUN ON THE VELOCE.



ON a recent visit to Birmingham we accepted an invitation of the Veloce Co. to sample the running of one of their 2½ h.p. machines. The day was not auspicious, for all the morning it poured with rain, and in the afternoon dried up just enough to give the tramlines and setts a treacherous coating of grease. However, the low build and light weight of the machine emboldened us to make a start, so the low gear was engaged and the machine given a push, whereupon the engine started to fire slowly, so slowly, in fact, that we were able to depress the gear pedal to the free engine position with great ease and then mount the machine in comfort and tuck in coat tails, etc., before engaging the clutch. The gears are operated by a rocking pedal with the left foot, pressure backwards engaging the low ratio, and forwards the high.

2½ h.p. Veloce engine, showing mechanical lubricator and oil pump under crank case, also outside flywheel and overhead inlet valve arrangement.

The Low Gear Seldom Needed.

On letting in the low gear the machine slid gently away, and after slight acceleration in went the high without a suspicion of jerk. As far as power was concerned the low gear need never have been used, but we found it a great blessing in the thick traffic and on the greasy roads. A slight sing in the gears was noticeable but not unpleasant, whilst the exhaust and the valve timing gear are beautifully quiet. Through seas of mud we churned our way all morning, and though the particular machine lent us was fitted up in T.T. style with only regulation width guards they were so well arranged that the mud thrown up was not excessive. In the afternoon we had a practical demonstration of the advantages of forced lubrication, for on slippery roads in thick traffic one is relieved of all trouble in this direction by an occasional glance at the indicator. We noticed two points in particular, one was that the outside flywheel permitted the engine to run very slowly, and although it revolves in a contrary direction to the road wheels the effect is not noticeable; in fact, the machine is very steady in grease. Secondly, that throughout the heavy rain there was no suspicion of belt slip, which may be accounted for by the large geared-down engine pulley. The gear ratios used were 5½ to 1 and 9½ to 1 approximately.

The complete machine. The large diameter geared down engine pulley will be noticed.

The Works Organisation.

On returning to the works Mr. Taylor showed us round, and we were delighted with the jigs and tools in use and the careful way in which the parts are turned out. For the present year the 70 × 76 mm. engine only will be manufactured, but it is possible that a larger model also will be marketed in 1913. Before leaving the works in Clissold Place we were introduced to Mr. Nat Woods, of Christchurch, New Zealand, who had just placed a considerable order for motor cycles with Veloce, Ltd.

BROOKLANDS WHIT-MONDAY MEETING.

Entries for the motor cycle races are as under:

2.20 P.M.—THE EIGHTH SHORT MOTOR CYCLE RACE (A HANDICAP).

E. F. Remington (Matchless)	W. Stanhope-Spencer (Rudge)
M. Campbell (Triumph)	H. Jepson (Zenith)
Captain P. Y. Harkness (Triumph)	R. L. Printz (Bat)
N. A. Ayres (Singer)	Paul Schmidt (N.S.U.)
G. E. Stanley (Singer)	A. G. Fenn (Humber)
E. A. W. Davis (Triumph)	E. Kickham (Douglas)
S. C. Winfield-Smith (Singer)	S. R. Axford (Martin)
S. L. Bailey (Humber)	D. Lavender (Triumph)
F. G. Edmond (Humber)	P. Weatherilt (Zenith)
W. G. Fowler (Rudge)	F. W. Barnes (Zenith)
J. A. Manners-Smith (Triumph)	Howard Smith (Triumph)
W. Dewar (Triumph)	S. M. Friedlander (Calthorpe)
W. H. Elce (Rudge)	R. Barclay (Rudge)
	M. L. Ainslie (Zenith)
	A. G. Walker (Rudge)

3.20 P.M.—THE SEVENTH LONG MOTOR CYCLE RACE (A HANDICAP).

E. F. Remington (Matchless)	W. H. Elce (Rudge)
M. Campbell (Triumph)	W. Stanhope-Spencer (Rudge)
N. A. Ayres (Singer)	H. Jepson (Zenith)
Capt. P. Y. Harkness (Triumph)	R. L. Printz (Bat)
G. E. Stanley (Singer)	Paul Schmidt (N.S.U.)
E. A. W. Davis (Triumph)	A. G. Fenn (Humber)
S. C. Winfield-Smith (Singer)	E. Kickham (Douglas)
S. L. Bailey (Humber)	S. R. Axford (Martin)
F. G. Edmond (Humber)	D. Lavender (Triumph)
W. G. Fowler (Rudge)	P. Weatherilt (Zenith)
J. A. Manners-Smith (Triumph)	F. W. Barnes (Zenith)
W. Dewar (Triumph)	Howard Smith (Triumph)
	S. M. Friedlander (Calthorpe)

Racing commences at 2 p.m., and in addition to car events, there is an aeroplane handicap.

AMONG THE ACCESSORIES.

Novel Spare Parts Case.

Quite a novelty is a new spare parts case which we illustrate. It has been brought out by A. W. Gamage, Ltd., of Holborn, and is shown fitted with the various items which a sidecarist would find useful on a long tour. It is intended

A sidecar spare parts case.

to be placed under the cushion of the sidecar seat. In it will be seen almost everything a sidecarist could possibly require, such as spare belt, Bosch magneto spares, Tinol outfit, high tension wire, belt cutter, tyre repair outfit, Philcut, spanners, exhaust spring compressor, spare exhaust valve spring, spare sparking plug, B. and B. jets. This method of carrying spare parts strikes us as a particularly happy one and likely to appeal to all sidecarists.

A Magnetic Speedometer.

The Stewart speedometer works on quite a different principle from that to which the average motor cyclist is accustomed. The principle of its working is magnetic, and the accompanying sketches illustrate clearly the method employed and its construction. In fig. 2, the hollow cup A fits into the groove between the magnet E and the outer shell C. On the underside of this shell a bevel is cut, meshing with the driving bevel driven by the flexible shaft. On the spindle, attached to the cup A, the

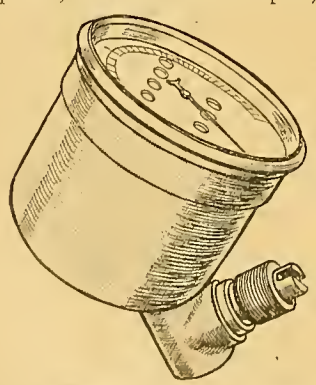


Fig. 1.—Indicating dial of Stewart speedometer.

pointer is carried. There is no mechanical connection between the cup and the magnet. On the movement of the rotor, as the whole of the revolving portion of

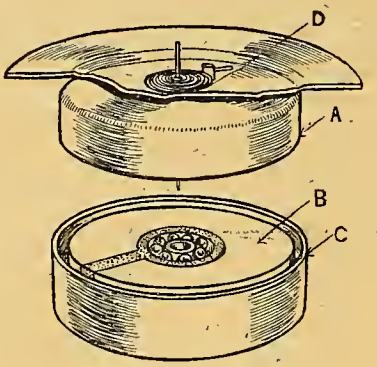

Fig. 2.—The cup and rotor.

which B and C are composed is called, eddying currents are set up, which cut the cup at its greatest diameter, while lines of force emanating from the magneto cut the cup directly over it. The tendency to revolve is resisted by the spring D, and is exactly proportionate to the speed at which the rotor turns. The only objection to this form of speedometer is that it is affected by the weather and temperature, and to overcome this difficulty an ingenious compensating device, illustrated in fig. 3, has been devised. It consists, as will be seen, of two bars of steel connected by a scissors joint at one end. As the long arm is extended owing to a rise in temperature, it raises the jewel bearing in which the cup revolves above the

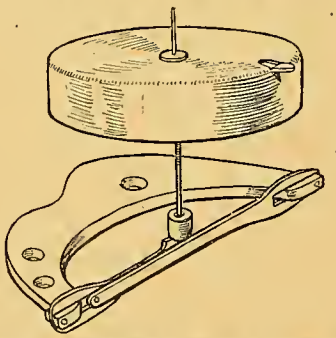

Fig. 3.—Compensating device for variations in temperature.

magnet, and consequently less force is exerted by the magnet upon the cup. The speedometer is very well made, and is of exceptionally simple construction. The method of transmission off either the front or rear wheel is by means of ordinary spur gearing. The reducing gear inside the swivel joint is by means of a worm, and gives a reduction of sixty per cent. This is a most important feature, as the rotor has only to revolve at about a quarter the speed of the mechanism of a speedometer working on the centrifugal principle. All the bevels and worm gears employed are particularly carefully cut. On the face of the instrument is an ingeniously made worm-driven distance recorder and trip with instantaneous re-set. The particular model we have illustrated is designed to be driven off the back wheel, the flexible shaft running horizontally along the top of the tank. Other models are designed to be front wheel driven in the ordinary way. This instrument is the production of the Cooper-Stewart Engineering Co., Ltd., 11, Denmark Street, Charing Cross Road, W.C.

Clothing for Motor Cyclists.

The East London Rubber Co., Great Eastern Street, E.C., have recently largely extended their clothing department, and are now paying special attention to this branch of their business. A novelty is the new all weather suit made of black rubber sheeting and lined with beaverteen—its chief feature is its complete impermeability to wind and wet. Another suit, known as the Kerry, is not without interest. It is made of ordinary waterproof material, lined with beaverteen, is of pleasing appearance, well finished, and provided with Raglan shoulders, storm collar, wind cuffs, and dome buttons. The trouser overalls are particularly sensible. They efficiently protect the seat, are furnished with a flap in front secured by spring buttons, a belt to go round the waist, and snow boot fasteners for the legs. Another suit, known as the Ideal, has the coat fitted with an overflap, forming an efficient protection against driving rain. A speciality is also made of oilskin suits. Quite a novelty is the Kerry cap. One type, known as the Shackleton, looks like an ordinary smart looking golf cap, but inside is folded a neat fur-lined flap, which, when pulled down, adequately protects the ears and back of the neck. On the occasion of our visit we were shown a new sidecar apron, of greatly improved pattern, which effectually protects the passenger, keeps the sidecar dry, and buttons up tightly round the neck. Yet another novelty sold by the East London Rubber Company is a complete waterproof outfit for ladies, consisting of a coat and skirt. It should

The Kerry waterproof coat and skirt for lady motor cyclists and passengers in sidecars.

The Shackleton cap with invisible fur-lined flap.

be quite as suitable for riding a motor bicycle as for wear by a passenger in a sidecar.

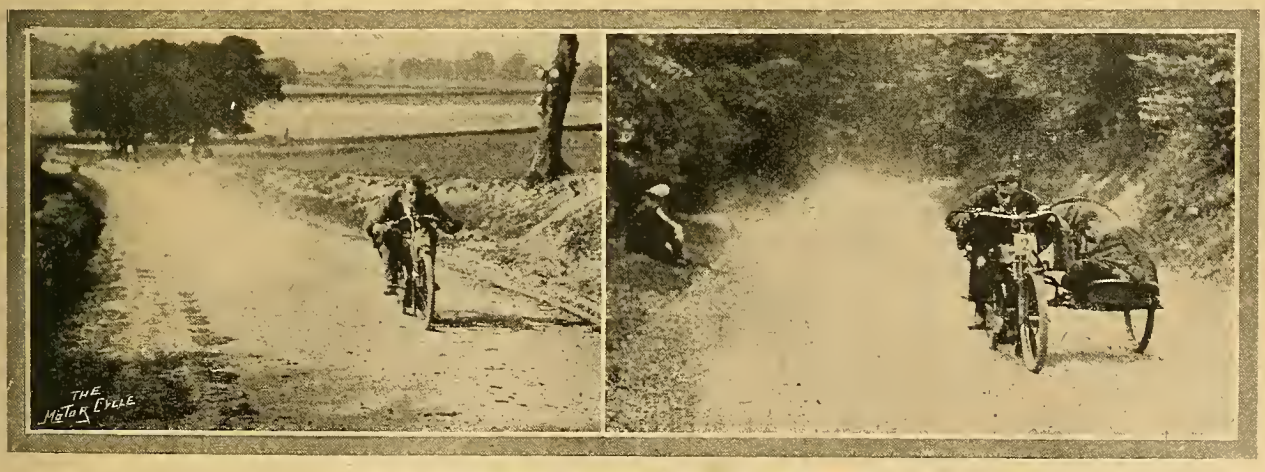
Latest News from the Isle of Man.

PREPARATIONS FOR THE TOURIST TROPHY RACE.

THE visit of Mr. T. W. Loughborough, secretary of the Auto Cycle Union, to the Isle of Man, which was referred to in a previous issue, came to an end on Wednesday, 15th inst. Our representative met Mr. Loughborough at Euston, and from him gathered all there was to know. He expressed himself as being delighted with his reception, and mentioned that everyone took the greatest possible interest in the races and desired to render every assistance to make them as successful as in previous years. The course he reported to be in excellent condition, except on the mountain road, where the surface was rather loose, but repairs were in operation, and by the time of the race it would be in perfect order. Several road improvements are also being effected, notably at Quarter Bridge, where the road is to be widened, and near Greeba Castle, where the corners are being improved. The starting point will be moved a little farther north, owing to building operations having occupied the old site of the grand stand. Better arrangements will also be made as regards the flagging of the course. Mr. F. Straight, late secretary of the A.C.U., was in the Island with Mr. Loughborough, and on account of his previous experience was able to render his successor a considerable amount of assistance.

F. H. Southam starting io the Birmingham M.C.C. members' hill-climb at Highley Hill, between Bewdley and Bridgnorth.
(*Photograph by T. Blyth Clayton.*)

Final Arrangements Completed.



An important meeting was held at the Government Offices, at which Messrs. T. W. Loughborough, F. Straight, T. Sargeaunt (Government Secretary), C. T. C. Hughes-Games (chairman of the Highway Board), R. H. Cubbin (secretary of that body), and Colonel Madoc (Chief Constable) attended, when the final arrangements were completed. It was decided that no competitor would be allowed to use his machine on the course or any part of it after the hours of practice on any day, nor at any time on Sundays. Practising will only be allowed from Wednesday morning, 19th June, to Thursday, 27th June, from 5 a.m. to 7 a.m. A competitor must not leave Quarter Bridge after 6 a.m. During the whole of practice silencers must be fitted, but they are not compulsory in the race. Entries close on June 1st, and it is to be hoped that this classic event will receive the support it deserves. Everything points to the races being a complete success, and Mr. Loughborough, his co-workers, and the Isle of Man authorities will leave no stone unturned to render the two races as successful this year as they have been in the past.

Brief Details of Races.

JUNIOR T.T. RACE.—Friday, June 28th; distance, 150 miles; cylinder capacity limit, 350 c.c.

SENIOR T.T. RACE.—Monday, July 1st; distance, 187½ miles; cylinder capacity limit, 500 c.c.

Entries should be forwarded to the Auto Cycle Union, 89, Pall Mall, S.W.

M.C.C. MEMBERS' HILL-CLIMB ON THE CHILTERNS.
(1) H. E. Davison (Kerry-Abingdon) going well. (2) F. J. Watson (3½ h.p. Swift) making a good climb—this machine had a single gear of 5½ to 1.

Questions & Replies.

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Newport to Brighton.

Will you be so good as to direct me the best way from Newport, Mon., to Brighton, and also give the distance? My machine is a 3½ h.p. Triumph with sidecar.—B.J.J.

Your best route would be as follows: Newport, Severn Tunnel Junction, by train to Pilning, and through Patchway, Mangotsfield, Bath, Beckington, Warminster, Heytesbury, Salisbury, Totten, Southampton, Fareham, Havant, Chichester, Arundel, Worthing, by the old road through Shoreham to Brighton. Be careful of police traps in the neighbourhood of Arundel. The distance is about 170 miles.

Cost of Running—Single and Twin.

I am using a 3½ h.p. Humber, and intend getting a 6 h.p. Matchless for occasional sidecar work. Please say if the cost of running a two-cylinder Matchless without the car would be more than that of running my Humber. Is the two-cylinder more apt to break down than the single-cylinder?—A.B.

The cost of running a twin-cylinder machine, with or without a sidecar, would be slightly more than that of running a 3½ h.p. The twin-cylinder and sidecar is not more likely to break down than a single-cylinder, but it requires rather more attention to keep in order.

Decompressors.

(1.) What is a decompressor? (2.) What does it do? (3.) What is the difference in a coil sparking plug and a magneto sparking plug?—T.S.P.

(1 and 2.) There are several forms of decompressor—their object being to allow a certain amount of the compressed charge to escape so as to render the engine easier to turn for starting purposes. This is commonly brought about by a cam (which can be brought into action when required) which slightly raises the exhaust valve during part of the compression stroke. A decompressor is not to be confused with an exhaust valve lifter, which, though it serves much the same purpose, keeps the exhaust valve raised till loosed by hand. (3.) There is practically no difference between plugs made for battery and coil or magneto ignition. We have used both indiscriminately; as a matter of fact there are very few plugs made now for battery ignition on motor cycles.

Intermittent Running.

I should feel grateful to you if you could explain the extraordinary behaviour of my 3½ h.p. Triumph. It has, during the last fortnight, begun to slow after running about three miles, and the speed has only been kept up by closing the extra air and giving more petrol until the throttle is about threeqnarters open and extra air closed completely. Then the machine will go for a little and eventually come to a stop, but will start again in half a minute or so, and then will go again for about three miles when the same symptoms develop. I cannot account for this at all, as the cylinder is quite free from carbon deposit (I am using Price's Motorine A), compression good, the magneto clean, and points set to gauge.—A.F.

The symptoms are probably due to a partially choked jet, which occasionally clears itself and then gets blocked up again, or to a stoppage in the petrol pipe, which allows the petrol to flow through but not fast enough to supply the needs of the engine. The float chamber would have time to fill up during your stops and so the engine would start again.

Wem (Salop) to London.

I shall be much obliged if you will inform me the best route from Wem (near Shrewsbury) to Clapham, S.W., avoiding the worst hills, as my machine is only 2½ h.p.—S.A.

Your best route would be as follows: Wem, Wellington, by Watling Street to Atherstone, following the R.A.C. signposts to London, going through Daventry, Towcester, Weedon, Fenny Stratford, Dunstable, St. Albans, Barnet, Regents Park, London. Your best way to Clapham is over Westminster Bridge, down Westminster Bridge Road, Kennington Road; at the end of this turn right and you are in the Clapham Road. There is much traffic and many tramlines after crossing Westminster Bridge.

A FRENCH TANDEM.

The tandem form of motor cycle is seldom seen in this country. In France it is more numerous. The Rene Gillett tandem illustrated was noticed among the competitors' machines at the Circuit de l'Eure race.

Police Traps on the Great North Road.

[?] I propose going from London to Aberford (Great North Road), and then across country to Ulverston *via* Ilkley and Kirkby Lonsdale. Can you tell me where I am likely to encounter the police on this route, and whether you think it possible for a fairly new rider to manage the journey in one day, starting from home at about 5 a.m.?—C.E.H.

With regard to the Great North Road, most of the villages in Huntingdonshire are trapped. There is a trap working four miles north and four miles south of Grantham, between Ponton and Colsterworth at the south and from the bottom of Gonerby Hill to Long Bennington on the north. The police do not prosecute if you do not exceed 25 m.p.h. These, with Retford, are the only likely traps on the North Road. With the exception of the two Grantham traps the open country is quite free. If your machine is running very well, you could manage the journey in the day if you started at 5 a.m.

Accident caused by Cricket Ball.

[?] Recently I was the victim of a somewhat unusual mishap. Opposite my house is a meadow used as a cricket ground by a large local school "for the sons of gentlemen." The match pitch is in the centre, but as the field is not wide enough balls are constantly driven over the road into the opposite property. When practising they play on the edge and bowl towards the public road, and as they seldom put up the nets nearly all balls missed come across the road, as hedge and fence are "thin." During previous seasons damage has constantly been done to gardens, windows, and things inside rooms, and several people have been hit and injured, but damage has always been made good. One evening recently, as I was riding at about 15 m.p.h., a ball came across the road right under my front wheel, bringing me down. I suffered several painful cuts and bruises, besides considerably tearing my overalls and clothes. Lamp and horn were smashed and machine itself considerably damaged, and engine injured, necessitating partial taking down. The master in charge referred me to the headmaster. When I called on him later he expressed regret. After some talk and putting the facts before him, he thought, perhaps, he was morally responsible, but had doubts about being legally so. However, he promised if I took machine to my repairer he would pay his bill up to £1. Now I find no one will take on the job under these conditions. I should be glad to know: (1.) If I have a reasonable claim for damages? (2.) If so, the best way to get it made good? I propose to hand him the repairer's estimate and ask him to settle with me personally at once.—S.R.

Our legal adviser writes as follows: "It is certainly a rather difficult case to answer. There is, of course, no doubt that if 'S.R.' is able to ascertain the particular boy who caused the ball to fly across the road, he could sue him for the damage sustained. His father would not be liable, but as the scholars are stated to be 'sons of gentlemen,' perhaps the money would be obtained. As regards the headmaster, I think there would be some difficulty in making him liable. Apparently, the field is a suitable one to be used as a cricket field, except for the proximity of the road, but the letter states that the master has provided nets, although these are seldom put up. I think that the headmaster might be held liable if it can be shown that he knew the field was being used on this occasion without the nets being put up, or if it can be shown that it is customary to allow the field to be so used without the nets. In addition, 'S.R.' would have to show that the headmaster allowed the boys to play near the boundary of the field and to bowl towards the public road. I see that your correspondent states that damage has been made good in previous cases. Has this been paid by the master or the boys? If the former, all the better. Your correspondent would be quite right in getting an estimate and letting the headmaster know the amount, and he had better consult a solicitor and get him to press for payment, if the headmaster refuses to settle with 'S.R.' personally."

Cambridge to Marlborough.

[?] (1.) I have a 1912 Triumph and am thinking of getting a sidecar. I do not intend it for touring, but only for short pleasure journeys. Do you think the 3½ h.p. will take one satisfactorily? (2.) Also could you give me the best route from Little Shelford to Marlborough, Wiltshire, and to avoid any bad hills?—W.W.S.

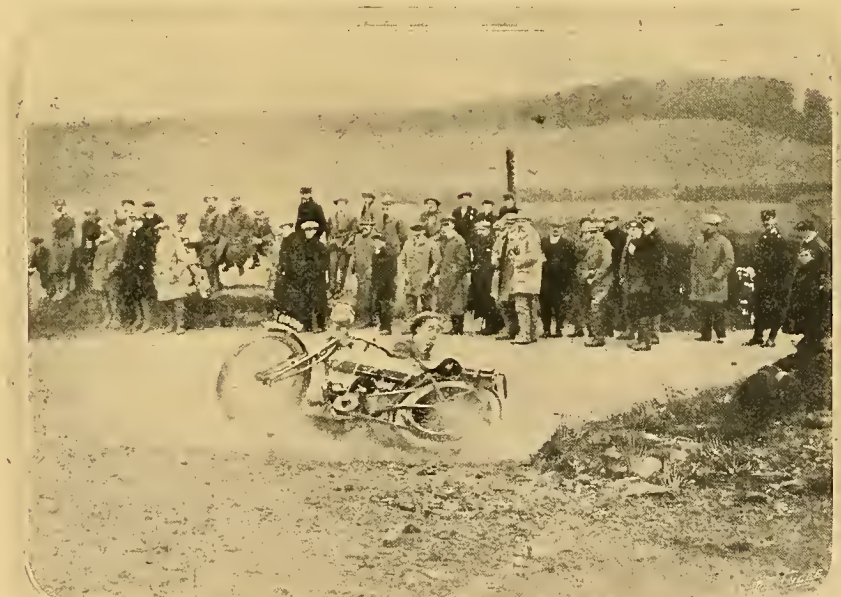
(1.) The machine would take a sidecar fairly well in not very hilly country. (2.) Your best route would be as follows: Little Shelford, Royston, Baldock, Hitchin, Luton, Dunstable, Tring, Chesham, Amersham, High Wycombe, Great Marlow, Henley, Reading, Hungerford, to Marlborough. This is rather hilly, but it is absolutely the best road. If you want to avoid the hills you must go through St. Albans, Watford, Rickmansworth, Uxbridge to Colnbrook, where you join the Bath Road, then go on through Reading. The latter route takes you through many suburbs with ten-mile limits, whereas the former takes you through exceedingly pretty country and over fairly good roads.

READER'S REPLY.

Sir,—Just a word of warning with reference to the best road to Cromer from the East Midlands. I rode from Spalding to Cromer through Long Sutton and Holbeach last Easter (the road you recommended) and back again, and on each occasion got a puncture (nail), once between Long Sutton and Holbeach, and once between Sutton and Lynn. The road runs near the railway, and the heavy carts that pass seem to drop nails. The best road, in my opinion, is through Mildenhall, Royston, Newmarket, and Fakenham, to Cromer. I am here speaking of road surface; no doubt the Holbeach Road is the more direct.—J. C. ALLEN.

EXPERIENCES WANTED.

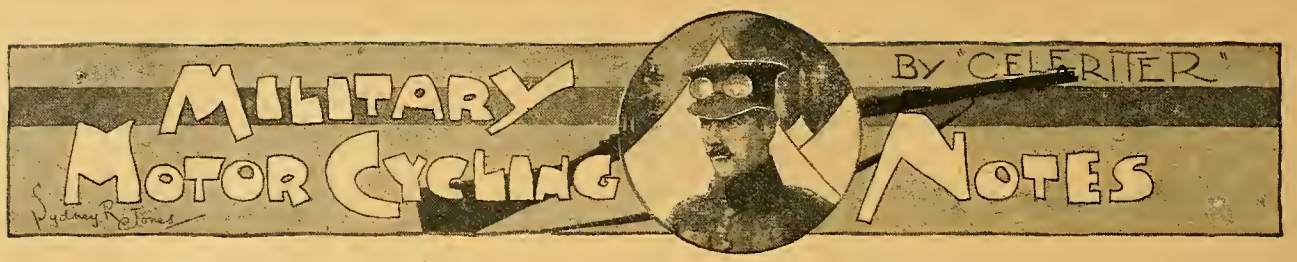
Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.



"E.J.W." (Ilford).—Wood-Milne steel-rubber tyres for 3½ h.p. machine.

"M.J." (Kensington).—5-6 h.p. four-cylinder F.N.

"F.E.A." (Askern).—6 h.p. Zenith and 6 h.p. Rex-Jap with sidecar.



"T.A." (Peebles).—3 and 3½ h.p. Lincoln Elk.

"S.L.L." (Stonehouse).—Lomax non-skid band on back wheel used with sidecar.

THE OUTCRY AGAINST DANGEROUS HILLS.

Though it is not our usual practice to publish photographs of motor cyclists in the act of biting the dust, we do so in this instance in support of the manufacturers' outcry against the selection of unsuitable and dangerous hills for competition purposes. A rider who escapes from a fall such as the one illustrated must be regarded as extremely lucky.

The Army Manœuvres.

THIS year the grand autumn manœuvres are to take place in the vicinity of Cambridge and Thetford, and no fewer than eight battalions of Territorial cyclists are to be included amongst the combatants. Each of these battalions can boast of about a dozen motor cyclists at least, so that, apart from all staff orderlies and umpire's messengers, there should be about 100 combatant motor cyclists out on the warpath between September 15th and 20th. In addition to these there will be another twenty motor cyclists or so belonging to Divisional Royal Engineers, and about sixty more required for staff duties. Thus for the first time in English military history the motor cycle will be fairly represented at the manœuvres —truly a feather in the cap of the War Office.

Where the Motor Cycle Scores.

The motor cycle has many important advantages over the car from a military point of view, and these may be summarised as follows:

1. It moves more rapidly.
2. It can get along better on a road blocked with much traffic.
3. It does not congest traffic on a road.
4. It is easier to turn round and manipulate.
5. It is less visible, and can be hidden in a ditch
6. It consumes less petrol (which may be difficult to obtain).

All these points are matters of grave import from the military point of view, and it can be safely said that for all despatch work the motor cycle will utterly supersede the car in the course of the next year or two.

How to become a Military Motor Cyclist.

Those of my readers who feel a desire to take part in Army manœuvres in the future will naturally desire to learn how they can do so and what are the conditions of military service. At the present time there are only two ways of achieving the desired end The first way is to become a Territorial (if you are not one already) and join (or be transferred to) one of the fourteen Divisional Telegraph Companies R.E. Your obligations will be those of any other Territorial, and you will do all your soldiering on your own motor cycle. Whilst at annual camp or Army manœuvres you will draw the pay and allowances of your rank as a "sapper" plus 6s. 6d. a day petrol allowance and an annual grant of 30s. cycle allowance.

The second way is a trifle more complicated, but will appeal, perhaps, to more of my readers. First, you must join the Territorial Force as above, and then after completing your recruit's course, say after three months, you apply to be transferred to the Special Reserve Section B. Your obligations as to drill and musketry thus cease, and only two obligations remain to you:

(1) To come out each year for Army Manœuvres (pay and allowances as above).

(2) Or if the expeditionary force be sent abroad or mobilised at home, you are liable to be called upon to go with it as a motor cyclist.

You receive every year a retaining fee of £4, and in case of war your motor cycle will be taken over by the State at a valuation.

Within a few days yet a third door will be thrown open to motor cyclists.

The Cyclist Battalions.

There are fourteen cyclist battalions in the Territorial Army, each battalion consisting of 525 officers and men, all cyclists. A new regulation is in course of print which allows each battalion to enrol seventeen motor cyclists, including one officer, one sergeant, and one corporal. These whilst at camp, in addition to their ordinary pay and allowances, will draw petrol allowance at the rate of 7s. 6d. a day. The battalions are raised in the following districts:

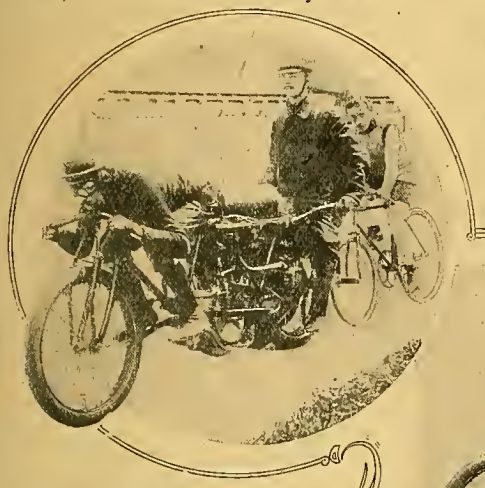
London Cyclist Battalion.—Headquarters, Fulham House, S.W.
Kent Cyclist Battalion.—Headquarters, Tunbridge Wells.
Sussex Cyclist Battalion.—Headquarters, 8, Ship Street, Brighton.
Hants. Cyclist Battalion.—Headquarters, Southampton.
Devon Cyclist Battalion.—Headquarters. Exeter.
South Wales Cyclist Battalion.—Headquarters, Park Street. Cardiff.
Birmingham and Coventry.—Only just sanctioned.
Essex Cyclist Battalion.—Headquarters, Brentwood.
Suffolk Cyclist Battalion.—Headquarters, Ipswich.
Norfolk Cyclist Battalion.—Headquarters, Norwich.
E. Yorks Cyclist Battalion.—Headquarters, Hull.
Northern Cyclist Battalion.—Headquarters, Sunderland.
Lowland Cyclist Battalion.—Headquarters, Linlithgow.
Highland Cyclist Battalion.—Headquarters, Birnam, Perthshire.

The Legion of Cyclists.

In the meanwhile, all motor cyclists desirous of taking part in the military defence of this country, either now or in the event of invasion, are advised to join the Legion of Cyclists, which already numbers over 2,000 members.

APPLICATION FORM.

Full Name .....
Full Address .....
In which Group do you wish to serve—1, 2, or 3?.....
Age .....
H.P. of Machine .....
Previous Military Service, if any (Rank, Corps, duration) .....
Will you act as Local Organising Officer? .....



Oath: I, the undersigned, do sincerely promise and swear that I will bear true allegiance to His Majesty King George V., his heirs and successors, and that, in the event of a general mobilisation, I will take up arms and serve him, his heirs and successors, to defend the integrity of Great Britain against foreign invasion

THE ART OF MOTOR PACING.

THE science of motor pacing, perfected by the continental riders, is practically unknown in this country, although we have many expert motor cyclists capable of holding their own in the best of company as regards racing and record breaking.

Therefore, in view of the fact that motor cycle paced events promise to figure to some extent in the sports programmes at home this summer, and as a result many motor cyclists will be making their *début* as pacemakers, the following hints, from the pen of a correspondent who has been closely connected with motor-paced racing abroad, will no doubt be appreciated.

STYLES OF PACING MOTOR CYCLES.
A German pacing machine which requires a man to steer and another to control the engine

The French style. The rider depicted is Franz Hoffmann.

An English pacing machine ridden by H. A. Cooper, who will pace H. H. Lee.

For all-round purposes a two-cylinder engine is to be preferred, the great secret being to have the motor running evenly, and it is absolutely necessary that the machine should start with the utmost ease. To obtain this result the carburetter and ignition should be most perfectly adjusted. It often happens that a two-cylinder will be firing without even a miss, yet it may be pulling irregularly, but this must be remedied, as if a motor is at all faulty in this respect it will "kill" the finest pace follower in the world. Ignition and lubrication are the principal causes of this fault. The timing of the two cylinders must be perfect, every part of the ignition must be spotless, and the oiling must be regular and given in small quantities, "little and often" being the motto. It is a decided advantage to have the spark advance fitted on the handle-bar, which for pacing purposes is considerably lengthened, so that the rider can sit well back and upright, and then it is not necessary to let go the bar when changes of speed are necessary. The method of fitting this by Bowden wires is very simple, and can be adopted with advantage.

Feet on the Ground.

The position of the saddle should be exceptionally low, so that either foot can be placed upon the ground, or if this be not possible a powerful brake should be fitted, but the combination of the two is preferable. The advantage gained by this is that the pacemaker when picking up his man is able to dash up at full speed, and suddenly slow up in a few yards, obtaining, if possible, the inside position so as to be able to get his man away first. A good "pick up" in a short distance race and half the battle is over, so it is advisable to practice this together in training. If it be possible to touch the ground with the feet as soon as the rider is "hooked on" the feet can still rest upon the ground for a time so as to steady the motor at this critical moment when the cyclist has quickly to work up his speed. The wind is one of the pacemaker's chief annoyances, as the speed of the machine has to be carefully regulated with and against the wind in order that the pace may be uniform the whole of the lap, and it is here that the handle-bar spark control comes in. In motor pacing machines, contrary to racing machines, weight is of little consideration; in fact, up to a certain point, the heavier the machine the smoother it runs.

When travelling at full speed the pacemaker, in the straights, should be able to watch his man by glancing over the right shoulder, and for this purpose again it is advisable to practise alone, as the natural tendency when looking behind is for the steering to follow the turn of the head—a point which can only be overcome by practice. The pacemaker should be able to converse with the rider, but on no account should the rider be allowed to converse much with the pacemaker except in brief, just giving instructions, such as "steady," "faster," "pass," etc. It is better to travel at a good even pace and go right through than to indulge in "gallery riding." All nuts and terminals should be secured by insulating tape. Every care and attention should be paid to details. Finally, there is the question of protection, which counts for so much, so after the regulations have been carefully considered, the resourceful pacemaker then sets to work to have himself and his machine equipped so as to shelter his man as much as possible as regards wind resistance, without infringing the pacing conditions.

J.S.

AUTO CYCLE UNION NOTES.

The A.C.U. Committee for 1912 is composed of the following members:

REPRESENTING THE ROYAL AUTOMOBILE CLUB.

Major F. Lindsay Lloyd.	L. M. Meyrick Jones.
J. R. Nisbet.	Capt. A. E. Davidson, R.E.
M. G Duncan.	D. C. Bolton.
R. Todd.	J. S. Mallam.
C. A. Smith.	W. G. McMinnies (also representing the Oxford M.C.C.)
G. F. Sharp.	
E. M. P. Boileau.	

REPRESENTING AFFILIATED CLUBS.

B. Marians.	S. Carter.
F. A. Hardy.	W. G. Tweedie.
C. C. Cooke.	F. A. McNab.
E. J. Bass.	J. Shaw Scott.
W. H. Browne.	D. W. Morgan.
C. J. Feeney.	D. K. Hall.
E. M. Oliver	H. A. Cooper.
V. Hart.	J. W. Ayers.
H. P. E. Harding.	Capt. D. F. Nicholl.
G. Rowden.	

REPRESENTING INDIVIDUAL MEMBERS.

J. W. G. Brooker.	W. Cooper.
A. Sharp.	B. T. Rice Pyle.
Otto Thomas.	Rev E. P. Greenhill.
T. H. Tessier.	G. L. Fletcher.
W. H. Wells.	A. H. Priestley.
W. Pratt.	G. N. Higgs.

The following officers of the A.C.U. were elected to serve for the ensuing year:

Chairman, Mr. Robt. Todd; vice-chairmen, Major F. Lindsay Lloyd, Messrs. J. R. Nisbet, Otto Thomas, and W. H. Browne; treasurer, Mr. J. S. Mallam. These gentlemen form the Management Committee of the Auto Cycle Union.

TRADE MEMBERS ON THE A.C.U. COMPETITIONS COMMITTEE.—It was decided that no member of the trade should be eligible to serve on the Competitions Sub-committee. A member of the trade is taken to mean one who is a manufacturer of or dealer in motor cycles or their accessories.

AFFILIATION.—The following clubs have become affiliated to the governing body: The Stroud and District, the Luton and South Beds., the Llanelly and District, the Merionethshire, and the Kidderminster Motor Cycle Clubs; also the motor cycle section of the Derbyshire and North Staffs. A.C.

MEMBERSHIP.—The increase of membership during the last month amounts to 492, composed as follows: 15 full members, 199 touring members, 160 members of clubs newly affiliated, and 118 new members of clubs already affiliated.

UNOFFICIAL TRIALS.—The following recommendation was passed by the General Committee: "Any owner, manufacturer, dealer, agent, or driver taking part, or directly connected with any trial or competition otherwise than under regulations made by the Union, and obtaining extensive advertisement therefrom, shall be deemed guilty of a breach of these rules, and shall be suspended."

UNOFFICIAL RECORDS.

BY "IXION."

THE A.C.U. has put its foot down upon unofficial records just in time. There was a period when these runs served a moderately useful purpose. Arnott's and Silver's End-to-end runs were dogged struggles with feeble and unreliable machines, and served both to inform the public that motor cycles were becoming roadworthy, and to prophesy that the motor cycle would be the cross-country mount *par excellence* of the next decade. The faster runs of later date over the classic course, ranging from G. P. Mills to the late A. J. Moorhouse, were more in the nature of personal achievements.

This record has now served its purpose. We all know that a first-rate motor cycle could easily be driven 880 miles in less than thirty-two hours, so the record has no longer any technical or mechanical interest; it has become purely a rider's record, as such no objection could be made to continued attempts, barring the fact that it is highly dangerous to the rider and to the public.

Much the same is true of the old six days' record. When B. H. Davies initiated this particular type of ride, a large proportion of the public fancied that a journey of 1,200 miles in a week would knock the rider to pieces, supposing his machine lasted out. By the time A. E. Catt came near doubling the distance, machines had made too much progress for the ride to possess any mechanical interest, and the ride was really a rider's record, though it acquired special interest because is was performed in the winter when the roads and weather were bad. Its main public interest lay in its being a magnificent demonstration of the possibilities of winter riding. Subsequent six day rides, attempted or performed in the summer, were entirely devoid of mechanical interest, and have attracted little attention except from collectors of statistics, the rider and his friends, the makers of the machine and accessories utilised, and, possibly, the police. The vast majority of readers will be glad to hear that these unofficial records will cease to be described in *The Motor Cycle*; they possess no technical interest or merit, and the condition of the rider, should he succeed, is usually no advertisement for the pastime.

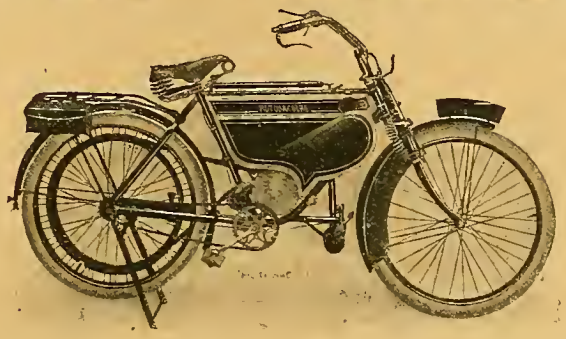
THE SPEED OF JUNIOR TWINS.

Paul Pean, winner of the Circuit de L'Eure, described in our last issue, at a speed of 37½ m.p.h. His machine is a 350 c.c. 2¾ h.p. twin Peugeot with automatic inlet valves. The French race referred to is almost on a par with the Manx T.T. Race, so that the comparison of speed is interesting. P. J. Evans, the Junior T.T. winner, averaged 41½ m.p.h. on his twin Humber.

Here is the

SPECIFICATION

"THERE AND BACK" without any trouble.



Of the CLEANEST, SIMPLEST, QUIETEST, and FASTEST LIGHTWEIGHT in the world.

The 2½ H.P. MOTOSACOCHE.

PRICE, with Free Engine,

£38

V Rubber Belt and Direct Drive optional.

PRICE, with Free Engine and Motosacoche Change Speed Gear,

£44

ENGINE—2½ h.p., 64 ×90 m/m., with mechanical inlet valve (perfectly shielded from the rider's clothes).
CARBURETTER—Dufaux (Patent).
CONTROL—Everything from handle-bar and footrests.
FREE ENGINE—Controlled from right handle end (Patent) or footrest if gear is fitted.
SILENCER—Silent (fitted with foot controlled cut out if required, extra).
IGNITION—Bosch high tension gear driven.
BELT—⅝in. strengthened Whittle V shape.
NUMBER PLATES—Front and Back.
INSTRUCTION BOOKLET—(in the tool bag), also Spare Parts List.
TANK—Carrying petrol (nearly one gallon), oil, paraffin, with gauges (all combined in one vessel).
FRAME—Latest design, exceptionally strong and low, giving plenty of belt clearance, height from ground to top of saddle from 31in. upwards and is fitted with Druid spring forks, *and footrests*.
BRAKES—Back brake working on belt rim, by foot. Front brake working on front wheel rim.
WHEELS—26in. fitted with Non-skid **Avon** Tyres.
MUDGUARDS—Round section strengthened, especially wide.
CARRIER—Tubular, strong but light.
STAND, "KICK-UP"—Held up to mudguard with a spring clip when not in use.
SADDLE—Lycett's la Grande.
TOOLBAG—Pannier, containing all necessary engine and cycle tools and oilcan, also instructions.

MOTOSACOCHE

FOR GENTLEFOLK — NO VIBRATION

NO OILY DIRT — NO NOISE — NO GYMNASTICS

Would you like to see our "A" Catalogue? It is full of interest. Whether you want a MOTOSACOCHE or any other machine—LIGHT or HEAVY—a ½d. p.c. is all it will cost you to get it. So just sit down and write one out now, asking for Catalogue "A."

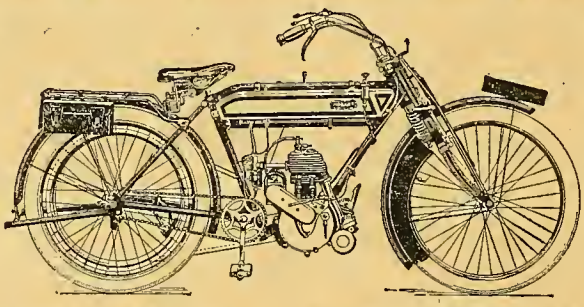
MOTOSACOCHE, LTD., 65, Holborn Viaduct, LONDON, E.C.

Telegrams—"Motosacoche, London." Telephone—Holborn 5439.

HOBART MOTOR CYCLE,

Four Distinct Models for 1912.

The 2½ **LIGHTWEIGHT** with Vertical Engine, exceptionally powerful and effective—For Hill Climbing it is unsurpassed.



LUTON HOO competitions—3 Events, 3 First Prizes! Most comfortable on long journeys. Very low riding position. Many other notable features are introduced. An Ideal Touring Mount when fitted with **FREE ENGINE and THREE-SPEED GEAR.**

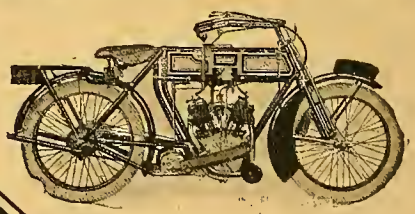
The 3½ h.p. STANDARD TOURING MODEL. Up-to-date in every respect. No faster Machine on the Market.

The 2½ h.p. LADY'S Model with FREE ENGINE and 3-speed gear.

Amongst the many improvements introduced are the following—
Adjustable Footboards.
Automatic lubricating device.
Antivibratory saddle, and
Dress Shields, detachable in 30 seconds.

London Agents—Messrs. Morris, Russell & Co., 6, Gt. Eastern St., London, E.C.

The new Type 4 h.p. TWIN CYLINDER for SIDECAR WORK.



Owing to the wonderful flexibility and efficiency of the patented Engine fitted to this model, it is strongly recommended for Sidecar work, a magnificent Hill Climber, and wonderfully economical of petrol. The rapidly increasing demand for it proves its superiority.

The BAT MOTOR MANUFACTURING CO., PENGE, LONDON, S.E.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street E.C., and should be accompanied by the writer's full name and address.

Hill Climbing.

Sir,—Bushcombe Lane was successfully climbed some two weeks ago by Mr. W. B. Gibb, of Gloucester, on his two-speed 1912 Douglas in the presence of about a dozen Cheltenham motor cyclists. This hill is very rough and has a reputed gradient of 1 in 3. Mr. Gibb also started unassisted on the worst portion, and gained speed the whole of the way up (low gear 10⅜ to 1). H.A.C.

T.T. Entrants and the Olympia Show.

Sir,—Is it true that those makers who openly enter for the T.T. race are to be prejudiced in showing at the Olympia Show? If so, what an injustice to those firms who, without secretly subsidising private riders, have made up their mind to regain for British motor cycles the blue riband of motor cycle racing.

Why not first stop the thousands of little twopenny halfpenny events, and leave to the last the one event which is followed throughout the world? Is not the foreign trade of sufficient importance to get this fine advertisement for British motor cycles and their superiority, or are the manufacturers afraid?

Let us stick to the T.T. until we recover for Britain the famous Tourist Trophy. F.S.W.

The Danger of Uncontrolled Dogs.

Sir,—I see in the issue of the 9th that the attention of the A.A. and M.U. has been drawn to the uncontrolled dog danger on our highways, and that this body has communicated with the owner of some particular dog. What a boon it would be to motor cyclists if all motoring bodies would take up the matter really seriously.

Every week scores of riders get thrown from their machines, with more or less serious injury to themselves or their machines, more often both, and yet this danger on the highway goes on and seems to get worse than ever. I have been laid up in bed for months at a time from this cause, and am deaf in one ear as the result of one of the falls; only a month back I was thrown in Chalfont St. Peter; result damage to machine to the value of £5 and slight personal injuries. I think I got off luckily. Why should we be in this perpetual danger from an uncontrolled animal on the highway? Hoping the matter will be taken up strongly. F. W. APPLEBEE.

Weak Axles on Low-priced Sidecars.

Sir,—Now the motoring season has started, one can hardly help but be impressed by the number of sidecars seen on the road, especially of the low-priced variety, and against these I want to offer a word of warning.

The other day I was riding a popular make of 3½ h.p. motor cycle to which was attached one of those cheap sidecars. We were going along a level road (excellent surface and with the wind behind us) at about 35 m.p.h., when, without any warning, the sidecar axle suddenly broke, my friend and I being violently hurled into the hedge at the side of the road, and were lucky to escape without serious injury, the sidecar wheel continuing straight on and being picked up over fifty yards away. Had it been a wall, we would for a certainty have been killed.

Makers, to meet the demand for cheapness, send out sidecars the axles and fittings of which have a very small margin of safety, and it is a wonder there are not more accidents. ONCE BITTEN.

Pillion Seats.

Sir,—In February I invested in a 3½ h.p. three-speed Premier, and, having no storage for a sidecar without expensive alterations, I got a pillion seat. I used to carry my brother about on the carrier of my old jigger, so had no qualms about the steering.

Our first essay *à deux* resulted in a tumble in starting, but we got off very luckily. Next time we went on a quiet bit of road with some nice hills. We tried a few times down hill with free engine, but found the steering tricky. We then essayed a start on a good dip by lifting exhaust and popping off on the low gear, and rode a few miles backwards and forwards on middle gear. It took a long time and several narrow shaves before we could start with the aid of the clutch, at all times we found the steering tricky, and I did not feel inclined to risk taking my wife on it.

Now I have a sidecar, but, like others, I was a bit dubious of the capabilities of a 3½ h.p. for sidecar work on such hilly roads as I must travel in whatever direction I go. Three months have now elapsed, and several varied rides and one Easter tour have been enjoyed, and, thanks to my Premier, I have entire confidence in the 3½ h.p. to take us anywhere—with very little low gear work, and at any speed—with safety. The ratios I have used are 4, 5½, and 8¼ to 1. J.A.S.

The Problem of the Automatic Carburetter.

Sir,—May I contribute a few words on the subject of so-called automatic carburetters, which I note are receiving attention in your columns?

Often the term "single lever" would be more appropriate than "automatic," because there is, in many cases, no more automatic action than would be got by clamping together the

ENSURING AN EASY START.

At the start of the Rhnbina hill-climb. S. Davies (3½ h.p. Triumph) preferred to sit on his machine and he pushed off by two stalwarts. He secured second place in his class.

two levers of the ordinary carburetter control. Such single lever carburetters merely provide for a fixed air and petrol ratio, regardless of requirements.

Last year I purchased a multiple jet, single lever carburetter, and substituted it on my 8 h.p. sidecar machine for the standard B. and B., but the results were very disappointing.

In the first place, in order to obtain easy starting, one is bound to have a fairly large "small" jet. But then, on the other hand, taking good easy roads at 20-25 m.p.h., 75% of one's riding is done on one jet alone, the larger jets being reserved for hills. In other words, the main bulk of one's running is done with just the same quantity of air and petrol as is required for easy starting; thus, I got hot, noisy running on the level.

Take the other extreme—a hill requiring the full power of the engine. One opens the throttle wide, and "automatically" exposes more extra air holes, whereas in ordinary carburetters one would desire to close the air lever slightly under these circumstances. The same difficulty is encountered after turning a sharp corner on a slight gradient. One cuts the petrol right off to take the corner, and then requires full petrol and very little air for re-acceleration, but with the "automatic" this is not permitted. J. F. BRIGGS.

Sir,—In spite of all that the makers of automatic carburetters may say, your readers may take it for granted that it is an absolute fact that no automatic carburetter can give a perfect mixture under all circumstances and conditions such as is possible by means of a separate adjustment of the air supply by an expert. It is not a difficult thing to make an automatic carburetter which will answer in a very fairly satisfactory manner, but to ensure reasonable efficiency through all the ranges of throttle advance, it will require adjusting to suit both the particular spirit used and the average temperature of the working conditions, which may vary to a very considerable extent even in the course of one day's ride. All practical riders know that there are times when one can hardly give enough air, and on other days this supply requires to be considerably reduced. How is the automatic appliance going to do this? So far the inventors have not been able to endow their production with brains.

One of the best automatic carburetters I have yet handled is that on the Flanders car, but, good as this instrument is, I find that to get the best out of it an extra air would be a great advantage. It would tell one in an instant what adjustment to make for alterations in weather conditions, or change of motor spirit. With the automatic carburetter, one cannot be expected to be always tinkering with the adjustment, and the result is that during a considerable portion of one's riding time the mixture is not at its best, and with an extra control over some of the air the rider would be in a position to correct these inaccuracies to his advantage.

A. C. PEMBERTON.

Dangers of Running Backwards on a Hill.

Sir,—I was interested to read the letter of your correspondent, "D 7530," in the last issue, and would like to call attention to the fact that the "A.J." automatic sidecar stand can be operated to act as a sprag in the manner he suggests. In respect to this fitment, it is only necessary to connect up a Bowden control for driver or passenger, and stand can be operated at will by either. If an attachment be fitted as I point out, no release spring need be fitted, as the stand will return to its position automatically.

A. J. SPROSTON.

Criticism of a New Design.

Sir,—The article entitled "A Novel Slide Valve Engine," which appeared last month, has just come to my notice. It describes an engine which the writer says approximates closely to the ideal. His design looks well in the drawing, but all he appears to have done is effectually to shield the most important part of the cylinder walls from the air, and this in order to place a type of slide valve in such a position that, for a given temperature of cylinder, the valve system will remain cooler than is at present the case. But since in so doing he shields the cylinder from air currents, the maximum engine temperature must rise, and I am of the opinion that by conduction the valve chamber, which is an integral part of the cylinder, will reach a temperature approximating to that of a poppet valve system.

The writer also states that the annular space between valve chamber and cylinder will probably assist the cooling of the latter; this is absolutely and entirely impossible.

Assuming the drawing to be roughly to scale, the valve system consists essentially of two metal cylinders roughly 7in. in diameter, moving relatively to the valve port and to themselves, the propulsion being by valve rods, connecting rods, and cranks. With such a mechanism, should lubrication fail, the immediate result will be seizure and buckled rods. In spite of this, the writer designs a complicated and doubtful gear, with which he annihilates the very scarce valve troubles of the poppet system.

I venture to predict that the writer's engine will lead him to troubles far more serious than those he is endeavouring to avoid. CHAS. H. GOULDEN.

The Trade and the T.T.

Sir,—If the B. Marians, who writes in the issue of May 9th, is the B. Marians of the P. and M. Co., I should like to ask what authority he has to write on this matter?

The question of cost to the trade, about which he says that no private owner can have any conception, is all nonsense. Are there no genuine private owners who have ridden in the T.T. and have paid their own expenses?

As a matter of fact, the most successful riders in the T.T. do not spend a lot of money. C. R. Collier assured me the other day that he would (and has done) leave London with £10 in his pocket, go to the Isle of Man, stay there a fortnight, ride in the T.T., and return with a balance still left.

It is well known that the Colliers do not take a workshop or a huge stock of spare parts, and yet no riders have been more successful.

Again, take P. J. Evans, the winner of the Junior T.T. I am quite sure that his expenses were not great.

Fancy an official of a firm who can make a machine which can be ridden for 1,000 miles without opening the toolbag, talking about huge stocks of spare parts and special models which stop the output of a factory for weeks in the middle of a season. Think of it! The whole of the factory working on one machine. What a commentary on their ordinary models.

No! Mr. B. Marians, you are wrong, no event has done more to perfect the British motor cycle than the T.T., and those firms who have been successful in the past are flattered by the way in which new-comers in the trade are copying their designs and measurements; and, forsooth, methinks it is these same copyists who, fearful that their copies will show up badly against the originals, are clamouring for the T.T. to be discontinued.

MOTOR CYCLE RACING ON THE VELVET STRAND AT PORTMARNOCK

A snapshot during the 20 miles handicap. After a good spell of racing at Portmarnock Beach there is to be two months' interval.

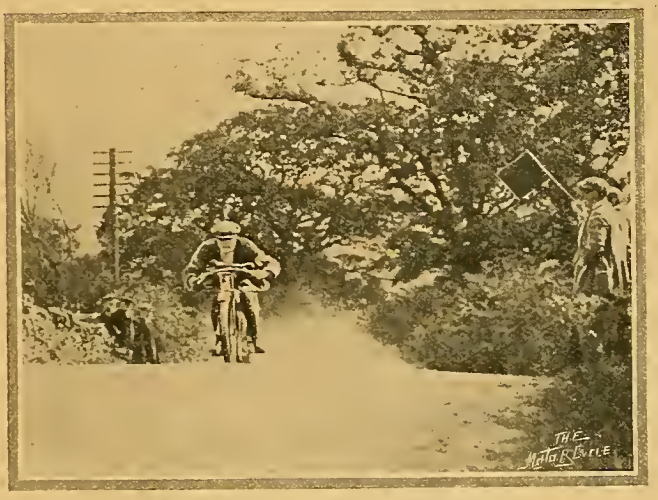
Let every maker decide for himself, without being threatened by the Manufacturers' Union, and may the 1912 T.T. show that Britain is still first and foremost in motor cycle construction. Many brains are at work at the present time in perfecting designs and details for the coming T.T.; work from which many motor cyclists of the future will get the advantage. E.C.P.

Sir,—I hope you will grant me a little space to reply to the criticisms of my letter regarding the T.T.

"One of Them" makes no reply to my remarks, but confines himself to the suggestion that I do not approve of the T.T. because the machine in which I am interested is useless for that event.

But he admits that the machine is a satisfactory touring model and "has proved itself reliable." That being so, it is obvious that participation in the T.T. is not necessary to the development of a touring mount, and I therefore find myself in complete agreement with "One of Them." But why does he not sign his name? He has really written nothing to be ashamed about!

Mr. A. A. Scott seems to doubt that a number of manufacturers find it necessary to have a stock of spare parts on the island. It may therefore be news to him to hear that it is not unusual for a number of complete reserve machines to be on the spot. B. MARIANS.



Inside or Outside Flywheels.

Sir,—I was very pleased to see "Passenger" taking up this momentous question. May I substantiate all he says, and add the following advantages of the external flywheel over the internal type: Far more flexibility. More mechanically efficient. Easier starting, owing to *(a)* momentum of flywheel overcoming compression, and *(b)* less tendency to gum up, owing to there being no internal flywheels churning up the oil. Saves about 15 to 20 lbs. in engine weight. Keeps up speed better on hills, and takes hills more slowly. Runs slower in traffic. Takes a higher gear without belt "snatching." Runs more freely with exhaust valve raised. Much better big end lubrication, owing to big end dipping in oil at every revolution. More space for larger big end bearing. Big end can be taken up without rebushing. Lower compression can be used to gain the same efficiency. No need for baffle plate under cylinder.

Somebody once stated that there is considerable oil drag with inside flywheels. There may not be much at high speeds, because, as the Condor Motor Co. stated, in your issue of February 8th last, the flywheels revolving fast cause the oil to be converted into a "Scotch mist." This is no doubt true, and, if so, where does the big end bearing get its oil from? A certain amount runs down the connecting rod, but there is absolutely none at the bottom of the crank case for the big end to dip into. It is also stated that the external flywheel engine has great disadvantages, but not what these disadvantages are.

There may be a few slight disadvantages of the outside flywheel, such as increased cost of manufacture, engine not quite so compact, possibility of crankshaft bending in case of a fall, but the latter can be easily overcome by fitting substantial footrests.

OUTSIDE FLYWHEEL.

Bradford M.C.C. Hill-climb at Leathley Bank.
F. Turvey (3½ B.S.A.) topping the rise just before the bad corner.

THE PROBLEM OF THE AUTOMATIC CARBURETTER. MR. BINKS REPLIES.

Sir,—Referring to the communication signed F. N. Pickett, in your last issue, the scriptural words, "The voice is Jacob's voice, but the hands are the hands of Esau," immediately occurred to me. Owing to the tone of this letter I first decided to ignore it, but the truly amazing statements that he makes should, in the general interest of motorists, not be allowed to remain uncorrected. He refers to a "constant level," apparently not knowing the difference between this and a high or low level. It is of importance that the petrol level should be constant to prevent "hunting." In my carburetters, at all events, it is immaterial whether the petrol is right at the top of the jet, as suggested by "E.M.O.," or some little distance below it. The question of petrol being allowed to dribble out of the jet of my racing carburetter when going uphill does not touch this point at all, as it is generally known that if petrol could be sprayed independently into a larger induction pipe, more power would be given at high speeds or greater power would be obtained at low speeds.

Referring to the 300 feet per second, it is common knowledge in the scientific world that ninety feet a second is the limit with which air can be drawn through a tube without setting up rarefaction. The mere fact of carburetters working at a much higher velocity than this only tends to show how bad they really are; at present there is no better way, but my venturi tube carburetter diminishes this effect.

Referring to his remarks concerning Mr. Brewer and his article appearing in the *Automobile Engineer*, I have no knowledge of this gentleman, and until his article appeared in this journal I was unaware that he was even interested in carburetters, but I think he will be amused when he hears that ten of the carburetters he described did not use choke tubes. Every carburetter that is made has a choke tube, without which no carburetter would work; whether the choke tube is fixed or detachable, which I certainly think it ought to be or whether it is part of the carburetter casting, is immaterial. He then refers to Mr. Brewer's remarks as to two-jet carburetters necessitating a certain amount of "stopping up." What this "stopping up" refers to I have no conception, but it would appear from your correspondent that it is some disadvantage. However, when it is considered that such cars as the Knight-Daimler, Napier, Siddeley, and Lancia (and there are no finer cars in the world) are fitted with two-jet carburetters, it is hardly worth enquiring further. Carburetters of this type, which have the jets and choke tubes instantly detachable, are the most easily understood carburetters that I know of, and the owner is enabled to tune up very easily.

My remarks about the petrol level will apply equally to your other more courteous correspondent "E.M.O." The only thing required if the petrol is constantly low is to have the jet orifice slightly larger. Regarding the respective working limits of a car engine and a motor cycle, I still contend that a car engine has the advantage. I have made engines that would drive a car smoothly at five miles an hour geared 3½ to 1 and accelerate up to over 50 on the same gear. I also have in my mind some tests recently made by S. F. Edge on one of his Napier cars. I think if your correspondent would look back in the columns of *The Autocar* he would find that the performance of the Napier car in question, as far as the range of speeds go, is probably greater than can be done with the same efficiency on a motor cycle engine. The question of the gear box has nothing to do with it, as I believe this Napier car would run about four miles an hour slowly and smoothly, and accelerate to over sixty on the same gear.

I am a pioneer in automatic carburetters for motor cycles, and naturally expect to have to contend with a deal of prejudice from a certain class of user, but, as a contributor in *The Motor Cycle* says, "No modern car is turned out without an automatic carburetter," and I think it will not be long before the same applies to motor cycles.

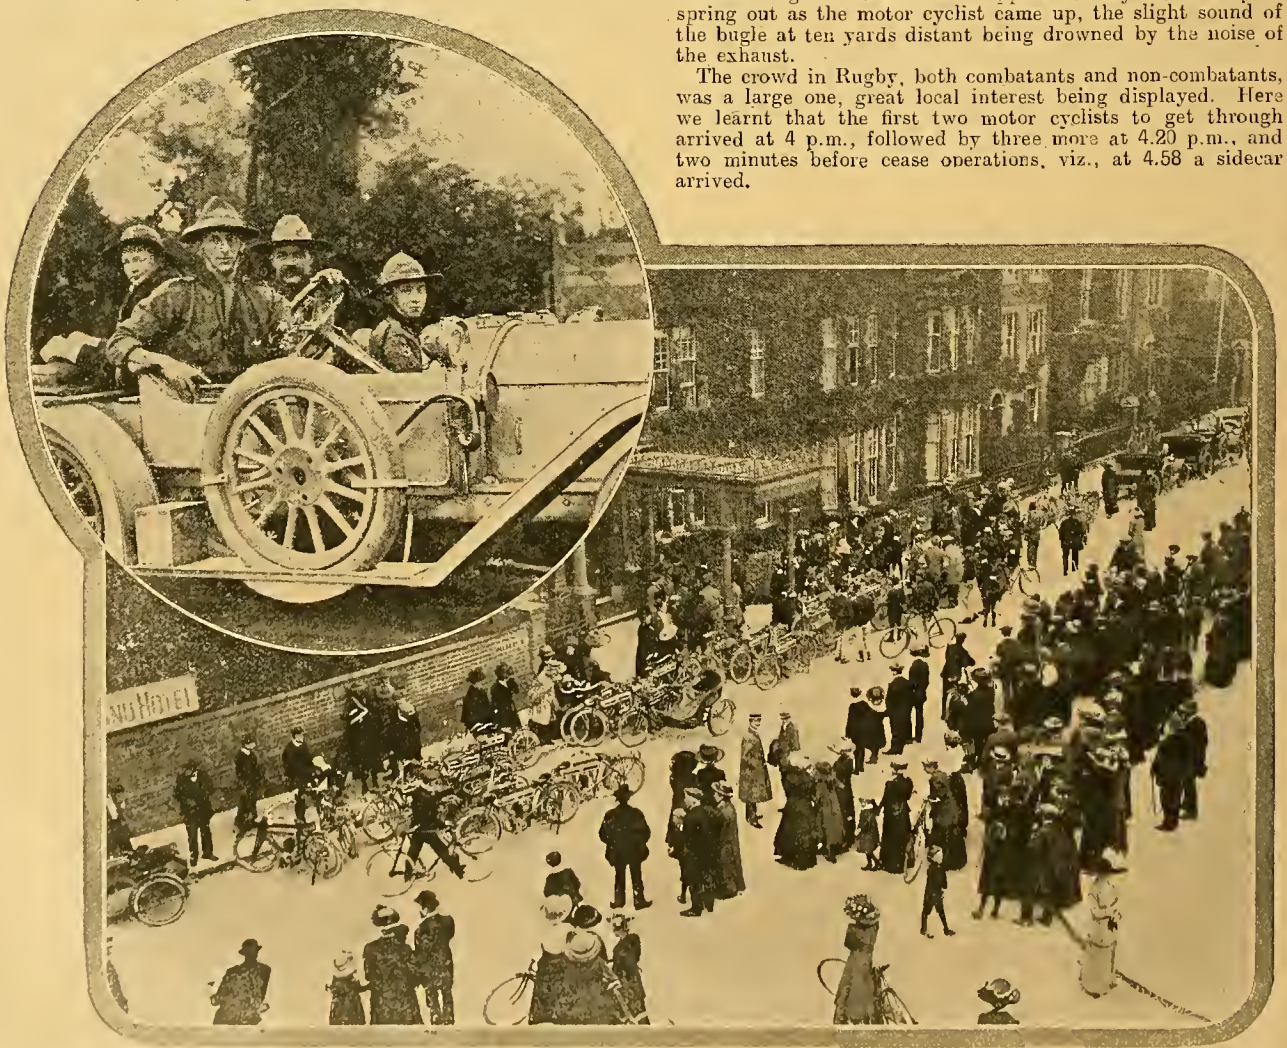
CHAS. BINKS.

Invasion of Rugby.

Coventry and Warwickshire M.C. v. B.P. Scouts.

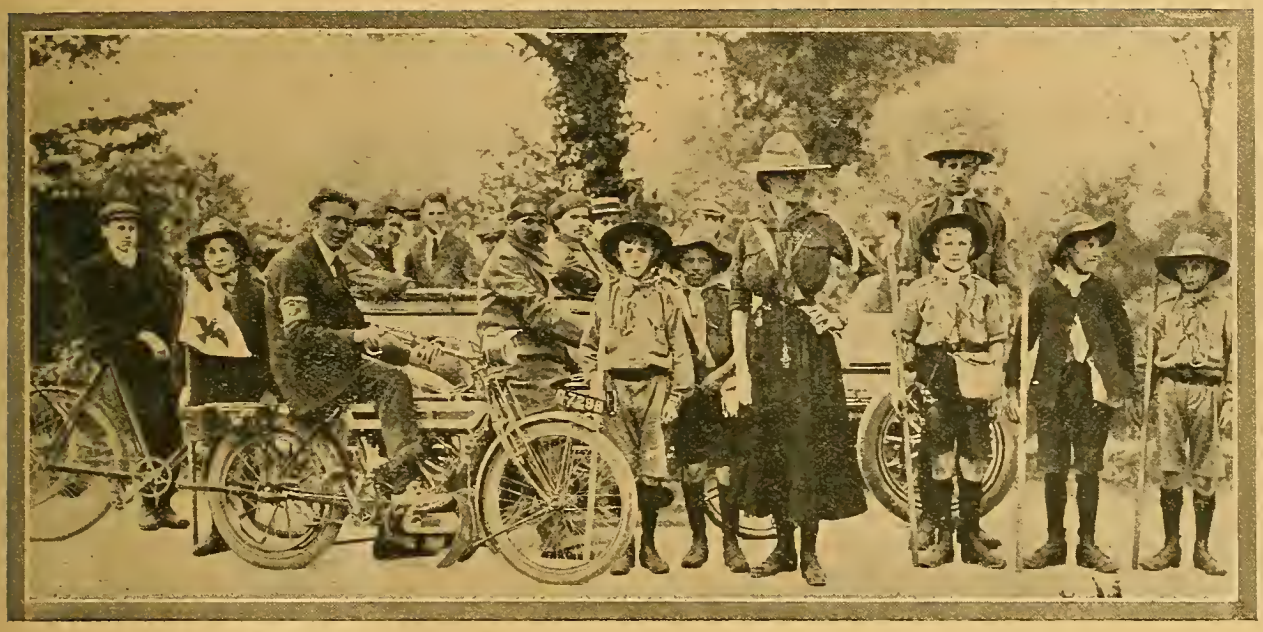
ABOUT seventy motorists on motor bicycles, sidecars, and cars, members and friends of the Coventry and Warwickshire M.C., opposed a force of 500 B.P. scouts drawn from various towns in Warwickshire and Northamptonshire on Saturday last. The general idea was that the scouts acted as defenders, and the motorists as the attacking force in an invasion of Rugby. The motorists' object was to reach a point in Rugby (Mr. I. B. Hart-Davies's office, Bank Street) without being captured. Five motorists were to reach this spot and leave their registration numbers as proof of success.

The Rules of the Game.



The principal rules were: A majority of one or more mounted captured the smaller number within ten yards, but if on foot the capture was by touch. Motorists wore white armlets, with the badge of the Coventry and Warwickshire M.C., and each vehicle carried a white flag. When captured the motorist's white armlet was changed for a red one, and the scouts placed a white band round their hats. Passengers in cars or sidecars could leave their vehicles but motor cyclists could not. Two circles were drawn from the centre of Rugby, the inner one with one and a half miles radius, and the outer six miles radius. Inside the smaller circle both sides were safe. No motorist could enter the larger circle until 3 p.m., and operations ceased at 5 p.m.

At a meeting held on Friday evening at Coventry the motorists were allotted stations on the edge of the outer circle, their positions being denoted by numbers. A corps of despatch riders under Captain F. Hulbert was the only means the motorists were allowed for communicating with their base headquarters, *The Midland Daily Telegraph* Office, Coventry. Mr. V. A. Holroyd was the commander of the motorists' forces, Mr I. B. Hart-Davies commanded the Boy Scouts, and the chief umpire was Captain Arthur Churchill.



Each scout section was under a scout master, and they were placed at about forty different points within the six miles radius, the following positions being strongly held: Bretford Bridge, Brinklow, Grandborough, and Dunchurch.

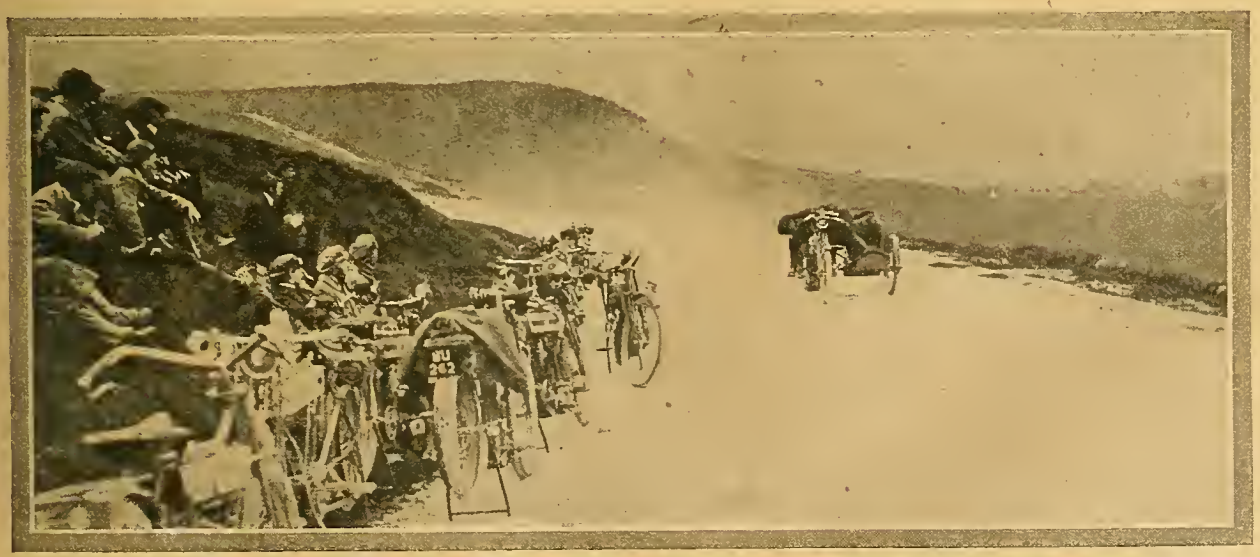
Shortly before 3 p.m. we came across the motorists' commandant at Stretton-on-Dunsmore, and with him caught the first glimpse of the outposts of the scouts, who had detrained at Dunchurch and walked to their post. Executing a rearward movement, as we were one of the attacking party, we rode by circuitous lanes to Monks Kirby and saw various parties of motorists circling round seeking an entry. In many instances the scouts' positions were disclosed by little knots of spectators who had gathered to watch the captures. Wherever the scouts had been allotted an isolated spot single motor cycle riders were easily captured, as the keenest boys hid behind the hedge, and, stationing a bugler, also in hiding, to give a soft warning of the motorist's approach, they were ready to spring out as the motor cyclist came up, the slight sound of the bugle at ten yards distant being drowned by the noise of the exhaust.

The crowd in Rugby, both combatants and non-combatants, was a large one, great local interest being displayed. Here we learnt that the first two motor cyclists to get through arrived at 4 p.m., followed by three more at 4.20 p.m., and two minutes before cease operations, viz., at 4.58 a sidecar arrived.

The assembly outside the Grand Hotel, Rugby, after the "invasion." The Coventry motorists were declared winners, seven of their force having reached the goal within the prescribed time. Inset, the Boy Scouts commander's car.

Coventry and Warwickshire Motor Club members and their captors. The scout mistress is Miss Whitehorne, of Harbury.

The following are the names of the successful riders:



*Clifford O'Connor (3½ h.p. Rudge) ...	4.0 p.m.
*A. N. Barratt (3½ h.p. Rudge)	
A. R. Blockley (3½ h.p. Rudge)	4.20 p.m.
A. S. Knox (3½ h.p. Triumph)	
Rupert May (3½ h.p. Triumph)	
L. E. Ward, passenger Dance (5-6 h.p. Clyno sc.)	4.58 p.m.

*Coventry and Warwickshire M.C. members.

We understood the first two entered the circle *viâ* Yelvertoft, the route of the second batch is a deadly secret, and the sidecar entered *viâ* Churchover and Cosford. J. F. Spencer rode five miles on the canal towing path, but found the scouts had not forgotten that means of communication with their fortress. Sam Wright crossed two ploughed fields with his sidecar, and covered about sixty miles, but could not evade capture. At the Coventry headquarters, *The Midland Daily Telegraph* Offices, the motor cycle despatch bearers, conveying information of the defenders' positions, began to arrive immediately after 3 p.m., the first message locating the scouts at Stretton-on-Dunsmore being brought by F. Hulbert, who on returning to the despatch line, got a little too far in and was captured. Six despatches were delivered per motor cycle, and the besieged got nine telephone messages through, so headquarters were kept well informed. The total captures by scouts, as far as could be ascertained, were four cars, eighteen motor bicycles, and two sidecars. Altogether both sides expressed great satisfaction with the day's fun, and, in our opinion, are to be congratulated on their excellent organisation.

Captain Churchill (chief umpire) praised the rapid mobility of motor cycles and said that as a means of taking the rider to a certain point where his machine could be hidden and the remainder done on foot, they were invaluable. In his experience a combination of the motor cyclist and pedal cyclist worked exceedingly well.

In conclusion, it should be mentioned that one of the objects of the manœuvres was to provide a field day for the boys, and, judging by their animated countenances, they thoroughly enjoyed themselves.

J. Emerson (5 h.p. twin Peugeot sidecar), making a good climb in the Stockport M.C.C. Hill-climb on the 19th inst., at Axe Edge, Derbyshire.

FIRST AMATEUR HILL-CLIMB.

GOOD RACING MARRED BY TWO ACCIDENTS.

J. St. John (three-speed Quadrant) and J. G. Nickson (Rudge-Multi) starting. St. John won this heat.

A SPLENDID afternoon's sport was witnessed at the Sutton Coldfield and Mid-Warwickshire A.C. first open amateur hill-climb at Harley Bank, Wenlock Edge, but, unfortunately, the proceedings were marred by two regrettable accidents. The first occurred during practice spins in the morning, M. A. J. Orde, son of Mr. Julian Orde, the R.A.C. secretary, colliding heavily with the bank in attempting to take the bend at too great a speed. He now lies in the Wenlock Hospital with a small bone in his leg broken and sundry bruises. It should be added that Orde, jun., is a motor cyclist of but three weeks' experience, and his T.T. Rover, which is capable of 60 m.p.h., is too fast for him. Miss Hough was the second victim, her spill occurring in Class II. for lightweights. On her first run up, when she easily beat her opponent, the speed of her open frame Douglas caused great consternation. She rounded the bend on the outside, and was observed to wobble slightly. On the next ascent the little twin seemed to travel faster than ever, but its speed was not checked at the corner, and, getting over the crown of the road, the camber (or, maybe, the ovation of the crowd) upset the driver, and she was seen to wobble violently, and the next instant dashed into two spectators who were unwisely sitting at the roadside watching the racing. Miss Hough was thrown heavily over the handle-bars, but soon doctors were in attendance, and she was conveyed to hospital, suffering from concussion of the brain and shock. A male spectator had a bad cut on his leg, whilst a young lady's ankles were bruised. It is almost needless to add that a great deal of the interest had vanished when racing was resumed.

A Prompt Start.

Credit is due to the Sutton Coldfield Club for leading the way in the matter of amateur hill-climbs. There has been a growing feeling of late that hill-climbing competitions will die a natural death if we are to see certain leading trade representatives sweeping the board week after week in different parts of the country. The amateur should certainly be encouraged, but it would appear necessary first and foremost to select a hill practically free from danger—there have been far too many accidents of late—and also to stipulate that novices, or first year motor cyclists, are ineligible. As to whether lady motor cyclists should be encouraged to compete in speed events is a question upon which we hold strong views. We refer our readers to the leading article in this issue.

The competition started punctually at 2.30 p.m., police and officials effectually keeping the course clear. The surface of Harley Bank is extremely good, and only at one point is caution needed, and that is the bend, which is a very gradual one, and consequently more dangerous than an acute bend, in many people's opinions, as it tempts the competitors to take liberties. The slightest mistake in rounding a bend at 40 to 50 m.p.h. spells disaster. Several hundred spectators gathered to witness the event; we counted fifty or sixty cars which had conveyed parties to Wenlock. There is no doubt that neck and neck racing in pairs is far more interesting to watch than the orthodox form of hill-climb, and it is unfortunate that there are so few suitable hills.

The classes were well arranged. The first event was for variably geared or free engine machines up to 520 c.c.

HEAT WINNERS: G. F. Cooper (3½ Triumph), J. St. John (3½ Quadrant), J. H. Fox (3½ Rudge), A. R. Felton (3½ Zenith), and W. H. H. Sheldon (3½ Regal-Precision).

SECOND ROUND: G. F. Cooper beat D. R. O'Donovan (2½ Singer) bye, J. H. Fox beat J. St. John, A. R. Felton beat R. W. Lovegrove (3½ B.S.A.) bye, and W. H. H. Sheldon beat F. W. Banks (Regal-Precision) bye.

SEMI-FINAL: G. F. Cooper beat J. H. Fox and W. H. H. Sheldon beat A. R. Felton.

WINNER: G. F. Cooper (3½ Triumph), who led at the finish by about twenty yards.

The final was a good race, but it was noticed that both competitors in their excitement steered a more erratic course than in the heats. G. F. Cooper, the winner, made fastest time in this class, viz., 54⅘s.

The T.T. Lightweights.

Class II. was for twin and single touring machines up to 350 c.c. T.T. regulations.

HEAT WINNERS: F. G. Smith (2¾ Douglas), A. D. G. Clease (2¾ Centaur), C. Smith (2¾ Douglas), L. S. Maclean (2¾ Humber), who, with Miss Hough (2¾ Douglas), were appreciably faster than any other competitors in this class, and H. S. Kershaw (2½ Levis).

SECOND ROUND: F. G. Smith beat A. D. G. Clease, L. S. Maclean beat C. Smith, and H. S. Kershaw beat Miss Hough, who fell when leading.

SEMI-FINAL: L. S. Maclean beat F. G. Smith and H. S. Kershaw beat P. W. Owen (2¾ Zenith) bye—the latter broke his belt in starting.

WINNER: L. S. Maclean (2¾ h.p. three-speed twin Humber).

Final of Class 1. G. F. Cooper (Triumph) winner, and W. H. H. Sheldon (Regal-Precision) rounding the bend at Wenlock Edge. The corner work at high speed was most exciting.

F. Mayell and S. Briggs (3½ Triumphs) practically level at the bend in Class III. The first-named eventually won.

Maclean finished an immeasurable distance ahead of his opponent, and accomplished fastest time in his class, viz., 57s. He never switched off for the corner and managed his machine in such a daring manner that many considered him reckless.

Quite a long delay now occurred, a lady slowly walking her pony and trap the whole length of the hill.

Thirty-two Competitors in Class III.

Class III. was for T.T. machines, singles and twins, up to 500 c.c. 1912 T.T. regulations. There were thirty-two entrants.

HEAT WINNERS: H. G. Potts (Triumph), H. Ball (Triumph), Howard Smith (Triumph), H. Eardley (Premier), W. H. H. Sheldon (Regal-Precision), S. Briggs (Triumph), F. Mayell (Triumph), R. H. Edwards (Triumph), H. E. Perry (Ixion), J. P. Macdonald (Norton), A. C. Hardy (Norton), R. Wood (Rudge), and F. C. Sangster (Ariel).

SECOND ROUND: H. G. Potts beat H. Ball, H. Eardley beat Howard Smith, F. Mayell beat S. Briggs, R. H. Edwards beat H. E. Perry, A. C. Hardy beat J. P. Macdonald, and F. C. Sangster beat R. Wood.

THIRD ROUND: H. Eardley beat H. G. Potts, W. H. H. Sheldon beat H. Petty (Singer) bye, F. Mayell beat S. Briggs, R. H. Edwards beat F. Mayell, and A. C. Hardy beat F. C. Sangster.

SEMI-FINAL: H. Eardley beat W. H. H. Sheldon and R. H. Edwards beat A. C. Hardy.

WINNER: R. H. Edwards (3½ Triumph), who also made the fastest time.

The final heat was splendidly contested. H. Eardley's Premier had a Binks racing carburetter, and he worked his way to the final by prompt starts and quick acceleration. In the final both he and Edwards were side by side, but the latter's machine was in exceptionally fine fettle and forged ahead, winning by a few lengths after an exciting race.

Class IV.—Unlimited.

HEAT WINNERS: G. E. Johnson (8 Matchless), C. W. Jameson (8 Matchless), and R. Wood (3½ Rudge). Byes: G. F. Cooper, A. C. Hardy, T. M. Hutton, E. C. Backhouse, W. H. Dunkley, F. Mayell, W. H. Sheldon, R. H Edwards, S. Briggs, E. V. Pratt, and F. H. Southam.

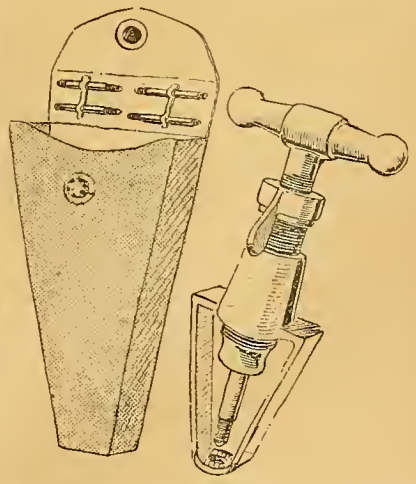
SECOND ROUND: C. W. Jameson beat G. E. Johnson, G. F. Cooper (Triumph) beat R. Wood (Rudge), A. C. Hardy (3½ Norton) beat T. M. Hutton (8 Matchless), E. C. Backhouse (3½ Singer) beat W. H. Dunkley (6 Matchless), W. H. Sheldon (3½ Regal) beat F. Mayell (Triumph), and R. H. Edwards (Triumph) beat S. Briggs (Triumph). Byes: E. V. Pratt and F. H. Southam.

THIRD ROUND: C. W. Jameson beat G. F. Cooper, A. C. Hardy beat E. C. S. Backhouse, R. H. Edwards beat W. Sheldon, and F. H. Southam (6 Zenith beat E. V. Pratt (3½ Ivy).

SEMI-FINAL: C. W. Jameson beat A. C. Hardy and R. H. Edwards beat F. H. Southam.

WINNER: C. W. Jameson (8 Matchless with Jap overhead valve engine).

FASTEST TIME: C. W. Jameson, 47s. (second round). In the final the winner took 48s. to ascend the hill.



The popularity of the Sutton Coldfield event is proved by the fact that eighty-three entries were received, competitors journeying from all parts of the country *by road*. For instance, G. F. Cooper, winner Class I., rode from Oxford, R. H. Edwards from Birmingham, and C. W. Jameson from Bedford.

M.C.C. LONDON-COVENTRY AND BACK.
Competitors filling up at Leighton's Garage, Bicester. The riders are: W. Cooper (Bradbury), H. J. Pooley, Capt., (Premier), Hollis (Douglas), and Beau (Matchless).

A BELT FASTENER PINNING DRILL.

The latest idea in belt drills has been shown to us by Messrs. Lycetts, Ltd., Birmingham, and we reproduce a sketch of it herewith. The device consists of the usual drill frame surrounding the belt. At the top is a coarse threaded screw which holds the belt in position, operated by the wing nut shown; working through the centre is a screw punch with a fine thread. This latter terminates in a recess into which fits the fastener bolt. In the case of the sample submitted to us the fastener bolts are screwed at each end, but later patterns will have the usual square head, and the plunger will have a corresponding square recess. To use the pinning drill a bolt is fitted to the punch and the end of the belt with fastener on it is inserted in the frame, the punch is screwed down, and drives the bolt through belt and into fastener without cutting any of the threads of the fabric.

Bradford M.C.C. Open Hill-climb at Leathley Bank.

IT was a lovely afternoon, with a strong breeze blowing, when a start was made for this event at 2.45 instead of 2 o'clock, and although there were only about ninety riders it was not until close on eight o'clock that the last man was despatched. The reason for this state of affairs was to some extent the amount of traffic, but it can chiefly be placed, in the first instance, to the sad lack of sportsmanship exhibited by the motor cycling spectators, who were continually riding up and down the hill, and, in the second instance, to the marshals (of which there were about twelve), who if, instead of leaving the work to one or two, had all done their best and put their shoulders to the wheel, would have carried the event through with *éclat*. However, in spite of the long intervals, the ball was opened by H. C. Newman, who made an excellent ascent, as likewise did Jim Mackay. E. Woods on his 2¼ h.p. Levis went up nicely. Result of Class 1:

	m.	s.
H. C. Newman (2½ Ivy-Precision)	1	13⅘
Jim Mackay (2½ Singer)	1	20⅖
Fred Mackay (2¾ Humber)	1	29⅗

Class 2, for standard touring machines, was notable for the appearance of some Scott machines, which climbed the hill in good style. Newman, as usual, went up well, and so did Barnes. Felix Scriven on a Rudge came up to the corner very fast, but failed to pick up. Result:

F. W. Barnes (3½ Zenith)	1	0⅕
V. Taylor (3½ Rudge)	1	4⅕
H. C. Newman (3½ Ivy-Precision)	1	5⅖

Class 2a, confined to amateurs, resulted:

V. Taylor (3½ Rudge)	1	4⅕
P. Tolfree (3½ Matchless-Jap)	1	7
J. Day (3½ Bradbury, 3-speed)	1	23⅗

Baulked by Non-competitors.

Class 3, for multi-cylinders, had only two runners. One, J. M. Somerville (5 h.p. Matchless), was baulked by a non-competitor, with the result that he failed to take the corner and fell, luckily breaking nothing but a few teeth. The winner was F. W. Barnes on a 6 h.p. Zenith, who travelled well, but was 1s. slower than his 3½ h.p.

Class 4, variable gears, not exceeding 560 c.c. Result:

P. Weatherilt (3½ Zenith)	1	14⅕
H. Gibson (3½ Bradbury)	1	24⅘
E. Myers (3¾ Scott)	1	32

Class 6, single-cylinder racing machines to 500 c.c.—There was considerable excitement in this class, for there was some very bad riding, some of the competitors coming off at the corner and others wobbling in an atrocious manner.

J. Mackay (2¼ Singer) making a good climb. He secured second place in his class.

Hugh Gibson (3½ Bradbury) approaching the corner. The large number of spectators present will be noted.

While competing in this event P. Weatherilt (Zenith) made the fastest single-cylinder time of the day. Hoffman on a Triumph made a very good ascent, and H. Reed (Dot) did well, the result being:

	m.	s.
P. Weatherilt (3½ Zenith)		59⅗
J. A. Hoffman (3½ Triumph)	1	3⅕
H. Reed (3½ Dot)	1	6⅕

The Amateur Class.

Class 6a was the same as Class 6, but confined to amateurs. Dawson (B.S.A.) came a cropper, but was not hurt, as likewise did Birkett (Triumph). Result:

V. Taylor (3½ Rudge)	1	4⅘
J. A. Hoffman (3½ Triumph)	1	5
P. Tolfree (3½ Matchless-Jap)	1	10⅕

Class 7, open to any motor cycle not exceeding 1,000 c.c., brought out some good ascents. Miss Hind took the corner very well. Weatherilt, after some fearful wobbles, parted company with his machine. Barnes and Shaw were evidently too fast for the hill, for they were continually cutting out; and T. Hargreaves was one of the unfortunate ones who were baulked by non-competitors. Result:

*F. W. Barnes (8 Zenith)		58⅖
H. D. Shaw (8 Zenith)	1	0⅗
V. Taylor (3½ Rudge)	1	4⅗

* Fastest time of day, winning Eric S. Myers Trophy.

Class 7a was confined to amateurs. Miss Hind again rode well, but Shaw was this time unfortunate, and fell. Result:

V. Taylor (3½ Rudge)	1	4⅘
A. Somerville (7 Indian)	1	6⅗
Miss Hind (6 Rex)	1	8

In Class 8 the only competitors were Gibson and Barnes, both doing splendidly. Result:

F. W. Barnes (6 Zenith sc.)	1	15⅖
H. Gibson (3½ Bradbury sc.)	1	42⅖

The class confined to members of the Ilkley and District M.C.C. was run on an improvement basis, competitors attempting to improve on a certain set speed. Result:

	Time.	Speed given. m.p.h.	Speed attained. m.p.h.
J. H. Hoffman (3½ T.T. Triumph)	65⅕s.	38.66	38.58
J. Norman Longfield (3¾ Scott) ...	83⅖s.	35.62	30.11
Bert Cowling (5 Indian)	78⅘s.	37.75	32.05

The winner takes the Dawson Challenge Cup and club gold medal, the others silver and bronze medals respectively.

CURRENT CHAT

TIME TO LIGHT LAMPS.

May 23rd	... ...	8.54 p.m.

,, 27th	... ...	8.59 ,,
,, 29th	... ...	9.1 ,,

Miss Hough Progressing Favourably.

Tuesday's report concerning Miss Hough's condition is distinctly favourable. Fortunately no bones were broken, the cuts on the face being the most serious.

Birmingham to Land's End and Back.

There are thirty-four entries for the Birmingham M.C.C. second trial to Land's End and back for the Lycett Trophy. The outward run is on Saturday, and the return journey on Whit-Monday.

A.C.C. de France.

The Committee of the Auto Cycle Club de France is now busy looking for a suitable circuit over which to hold the Grand Prix race on June 16th. There are five classes for motor bicycles from 250 c.c. to 500 c.c., and three classes for tricars and sidecars from 350 c.c. to 1,000 c.c.

Petrol Consumption.

In the issue of May 9th, we published a letter in our correspondence columns signed "Enquirer," querying the amount of petrol consumed by the average 3½ h.p. standard engine. The replies received in answer to this letter are so numerous that we are summarising them for publication next week. It is worthy of note that our statements and those of the makers are fully confirmed with regard to average consumption.

Grand Prix de Champagne.

The date of the above event, which is being organised by the Touring Moto Club of France, has been altered from June 9th to June 2nd. This is in consequence of an agricultural meeting which is to be held on the course on the original date. The course is 225 kilometres in length, 45 kilometres per lap. Two British competitors have already entered, G. E. Stanley and Rex Mundy, who will ride Singers.

B.M.C.R.C. Fourth Members' Meeting.

The fourth members' meeting of the B.M.C.R.C., fixed for Saturday, June 1st, includes three invitation car races, in which motor cycles of 500, 750, and 1,000 c.c. capacities will race against cars, besides a five-lap cyclecar handicap and an hour race for all-comers. Racing commences at 2.30 p.m. Entries close first post Tuesday, the 28th inst.

A six hours' race has been suggested, and, provided it is sufficiently supported, will be arranged during the season.

Five Miles Flying Start Record.

G. E. Stanley made an attempt on the hour record at Brooklands last Friday on his Singer, but was stopped by a broken inlet valve spring. He, however, broke the five miles (Class C) flying start record, his time being 4m. 26⅗s., which equals 67.51 m.p.h.

A Clean Ascent of Porlock on the Run.

In the reliability trial to Porlock and back, held by the Bristol M.C.C., W. W. Douglas, riding a Williamson sidecar machine, ascended Porlock Hill with W. Rossiter, who weighs 13 stones, as passenger. The low gear was 8½ to 1.

Arthur Moorhouse Memorial Fund.

Donations which amount to £177 2s. have been previously published. The third list is just to hand, and amounts to £24 7s., bringing the total of the fund to £201 9s., the amounts for which have been either promised or actually paid.

75 m.p.h. on a 3½ h.p.

For fear the paragraph in our last issue regarding G. E. Stanley's wonderful speed of 75½ m.p.h. on a 3½ h.p. Singer should be misinterpreted, we are asked to explain that the speed attained is not due to any special shape of cam—which some readers imagine is the case—but to the special setting of the valves, which naturally is a secret of the Singer Co. If Stanley has occasion to leave his machine unattended he takes special care to alter the adjustment.

SPECIAL FEATURES.

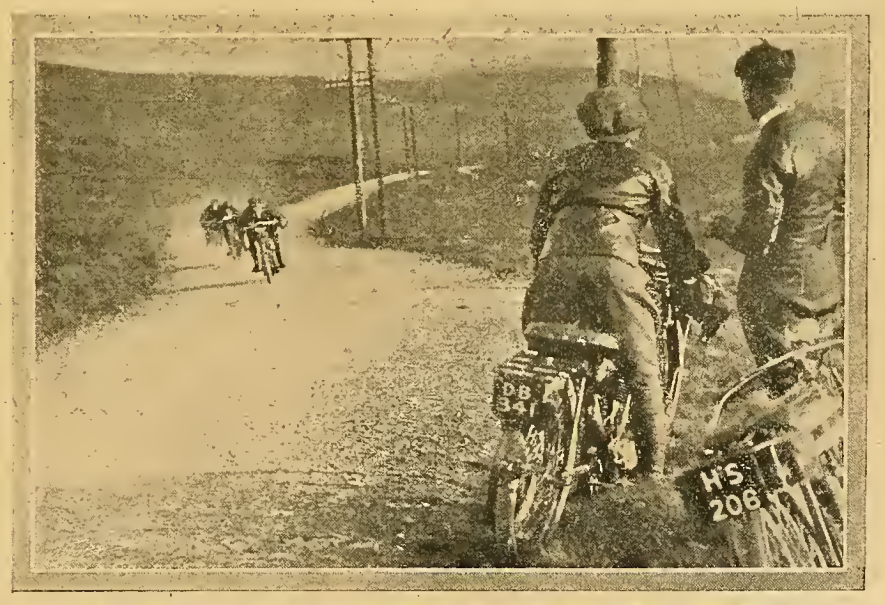
FIRST AMATEUR OPEN HILL-CLIMB

"INVASION" OF RUGBY.

Coventry Motorists v. Boy Scouts.

SHOULD LADIES BE ALLOWED TO RACE?

The Motor Cycle in Johannesburg.



On March 31st last year, 429 motor bicycles had been registered in Johannesburg. This year at the same date the number had increased to 833, nearly double.

Tourist Trophy Races.

To secure a good position at the start, intending entrants for the above should send in their entry forms to the secretary the A.C.U., 89, Pall Mall, S.W., as soon as possible. The winners of last year's races will start first, and after them the starting positions will be allotted in accordance with receipt of entry.

R.A.C. Warning Signs.

At the request of the Dorset county surveyor the R.A.C. has agreed to erect one of its special danger signs at Broadstone, on Corfe Hill, on the road between Corfe Mullen and Poole. There is a hairpin bend on a steep gradient at this place, and the danger is so acute that the ordinary red triangle has been of little effect. The R.A.C. special danger sign is specially intended for use in such circumstances.

Final of single-cylinder class in the Manchester Motor Club's hill-climb at Heyden Bridge, Woodhead. H. Smith (Triumph) winner, leading H. Taylor (Bradbury) and W. Munroe (Rover). (See Club News pages).

Issue May 16th.

Douglas

VIBRATIONLESS LIGHTWEIGHT

Proof of its Power and Hill-Climbing Capability.

Sidecars and Modern Lightweights.

Sir,—It may interest some of your readers to hear the results of attaching a light sidecar to my 1911 model E Douglas.

I had not previously driven one until the 27th ult., but after a short spin without a passenger I found one sufficiently daring to trust herself in my hands. To my surprise the little twin made comparatively light of Highgate Hill on the low gear and took Barnet Hill on top, and continuing my trip to Hitchin I had only to use the low gear occasionally, and, but for a strong headwind, I think this would have been unnecessary. I might add that I have no interest other than that of a thoroughly satisfied user.

R. W. WEBB.

BIRMINGHAM M.C.C. MEMBERS' HILL-CLIMB at HIGHLEY HILL, MAY 11th

Class 1, DOUGLAS FIRST.
The hill has a maximum gradient of 1 in 5.

NORTH MIDDLESEX M.C.C. RELIABILITY TRIAL, MAY 5th.

Miss Hammett, DOUGLAS, SILVER MEDAL. G. L. Fletcher, DOUGLAS, BRONZE MEDAL. "Fletcher made a fine performance on Sunrising Hill"—*vide* report in "THE MOTOR CYCLE."

IPSWICH AND DISTRICT M.C.C. HILL-CLIMB, MAY 11th.

Classes IV. and V., F. G. Hammond, DOUGLAS, SECOND.

SHEFFIELD UNIVERSITY M.C.C. INAUGURAL COMPETITION, MAY 11th.

Lightweight Class, DOUGLAS, SECOND. This event was held on a steep by-way with a gradient of 1 in 5.

MAY WE SEND YOU FULL DETAILS OF OUR MODELS?

DOUGLAS BROS., Kingswood, BRISTOL

Telephone—No. 51. Telegrams—"Douglas, Kingswood." **London—336, Goswell Road, E.C.**

Cyclecars.

The cyclecar trials arranged by the Birmingham M.C.C. for Saturday last, were postponed until July 20th owing to clashing of dates.

Australian Hour Record.

We have advice from Melbourne that J. Lukey (3½ h.p. Triumph) has beaten the Australian hour record by covering in that time sixty-two miles. The ride took place on the new sports ground at Melbourne.

Paris Show Arrangements.

The thirteenth French Show of cars, motor cycles, and cycles will be held in the Grand Palais, Paris, from December 7th to 22nd. Applications for space should be addressed to the secretary, 51, rue Pergolèse, Paris, not later than July 1st.

A Fillip to the Cyclecar Industry.

We hear that H.S.H. Prince George of Battenberg has placed an order for an 8-10 h.p. cyclecar sociable. Prince George is the first member of the Royal Family to patronise this section of the industry, and has selected the firm of Duocars, Ltd., for his patronage.

Testimonial to Mr. F. Straight.

Several readers have fallen in with F. Dover's suggestion, published last month, to present a framed testimonial to the late secretary of the A.C.U., Mr. F. Straight, and have sent us their signatures for facsimile on to a testimonial. The vellum will be placed in the artist's hands within the next few days, therefore any readers who would like their signatures to appear on it should send them at once addressed to the editor. Doubtless there are many competitors in past A.C.U. trials and others who would like to show their appreciation of Mr. Straight's services in the above form.

Hill-climb and Speed Trials in South Wales.

The South Wales A.C. and Cardiff M.C. will jointly hold an open and closed hill-climb at Caerphilly on July 18th, and speed trials at the Rest Bay Sands, Porthcawl, on July 20th. There will be numerous classes in the motor cycle events, and the formula used will be that recommended by *The Motor Cycle*, $\frac{W}{C \times t^2}$. There is also a class for cyclecars in each event. Entries close on July 10th. Information may be obtained from the joint hon. secretaries, Mr. J. T. Willows and Mr. H. B. Jotham, 12, Duke Street, Cardiff.

Side-slip Up-to-date.

A witness in a recent collision case was asked by counsel what happened to the motor cycle? The reply was, "Oh, that cocksiddled over." The judge (Sir William Selfe): "That's a new word; how do you spell it?" The witness, who came from Christchurch, said he did not know, but it was a Hants expression. The judge then asked, amid laughter, if they cocksiddled at Christchurch, and was told that the word applied to the over-turning of boats. The next time a motor cyclist has a bad skid he should remember to smile and remark that he merely cocksiddled over.

FUTURE EVENTS

May 24 to 27.—M.C.C. London to Edinburgh Run.
„ 27.—Dublin M.C.C. Open Reliability Trial and Sidecar Competition.
„ 27.—Cork and District M.C.C. Open Trial to Abbeyleix and back.
„ 27 & 28.—Bradford M.C.C. Open Trial to Dunbar and back.
June 1.—Birmingham M.C.C. Open Hill-climb at Wenlock Edge.
„ 1.—Liverpool A.C.C. Open Hill-climb.
„ 1.—B.M.C.R.C. Race Meeting.
„ 15.—M.C.C. TEAM TRIAL.

In the Wind.

A well-known manufacturer, whose name was a by-word in the motor cycle world a few years ago, is contemplating making a three-wheeled sociable, all three wheels of which will be detachable.

A famous engineer in the motor car world is designing a new, and we are led to understand entirely successful, hydraulic transmission for motor bicycles.

New Sidecar Counter-shaft Transmission.

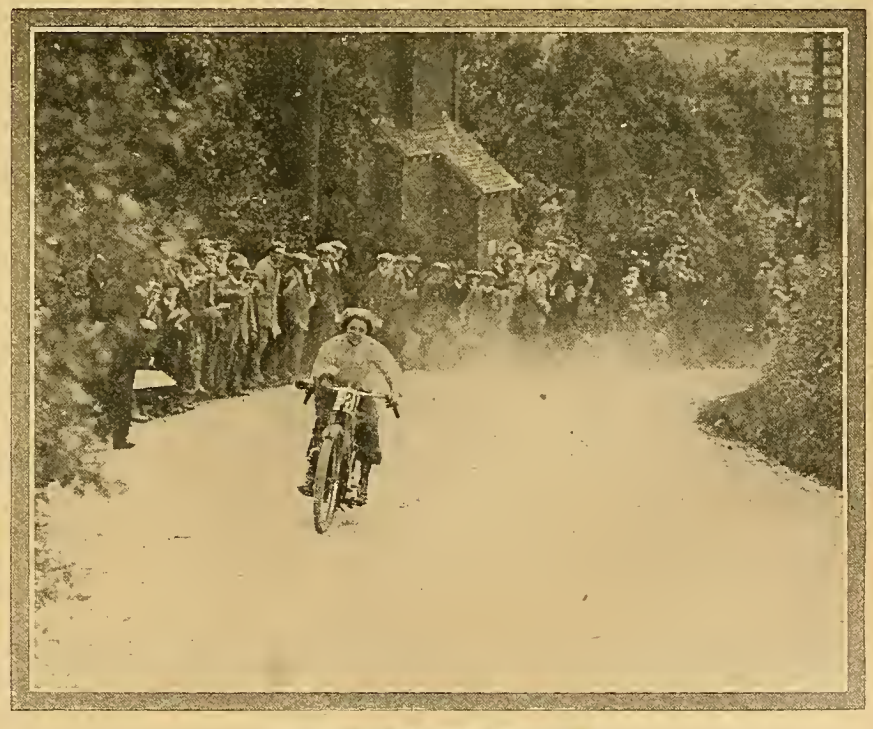
During the invasion of Rugby by the Coventry and Warwickshire Motor Club last Saturday we came upon Roy W. Walker with a 3½ h.p. New Hudson and sidecar. His machine was fitted with a very neat chain-driven counter-shaft and an 8in. front belt pulley. We learn that this fitting is as yet experimental, but is giving every satisfaction. It has the advantage of permitting the use of a kick starter, and the large diameter front pulley increases the life of the belt and practically prevents slip.

Wenlock.

Harley Bank, Wenlock, is being favoured for hill-climbing contests. Another open event has been arranged by the Birmingham M.C.C. for June 1st.

Stolen Machine.

A 3¾ h.p. Precision engined motor cycle and sidecar was stolen from the garage of Dr. Yates, City Road, Higher Openshaw, Manchester, in the early hours of the 10th inst. The engine number is 3605, frame number 202. The sidecar has a torpedo body, and the transfers on the tank and steering head of machine and mudguard of sidecar bear the following inscription: "The Rudolph," W. Raines and Son, Victoria Works, Fairfield, Manchester.



The Motor Cycle in Holland.

In sending us a photograph of the opening meet of the Dutch Motor Cycle Club, Mr. Citroen, the hon. secretary, states that the pastime is making great headway in that country, and every week new members are elected. The international reliability trial on August 5th is doing much to liven things up. F.N. and N.S.U. machines are the most popular machines in use; there are a few samples of British mounts, including Matchless, Rudge, Triumph, and Douglas.

Police Traps.

We have received information that a police trap is working in the Fenny Stratford five-mile limit. The police, we are informed, are very active.

On several occasions lately plain clothes men have timed motor cyclists on Westerham Hill, and summonses have been issued for driving to the common danger.

FIRST AMATEUR OPEN HILL-CLIMB.
Miss N. Hough (2¾ h.p. Douglas), a plucky rider who experienced a bad fall on Saturday at Wenlock. The snapshot was taken a moment before she fell.

N.W. London M.C.C. Open Passenger Trial.

THE success attending the N.W. London M.C.C. open trial for passenger machines last Saturday was attained beforehand by days of hard work on the part of the club's enthusiastic honorary officers, who had made up their minds there should be no cause for complaint. The somewhat intricate portions of the route near London and beyond Lanbury were arrowed in unmistakable fashion, not only by stout cards on walls, trees, etc., but also by ground posts at the same spots, so that if a competitor missed seeing one placed high, he was sure to be confronted by a lower one.

A novel system of route directing was also introduced, which we hope will be imitated by all other clubs organising open reliability trials. Where any corner or awkward turn

At the start from Jack Straw's Castle. G. Westacott (4 h.p. Zenith), G. Coombes (7 h.p. Indian), and J. Gibbs (2¾ h.p. Humber).

had to be negotiated, large cards bearing the words "right" or "left" respectively were affixed at least fifty yards before reaching a corner, and with this preparation drivers had enough warning to prevent them over-running places with which they were unacquainted. The route card was also a model production, it contained explicitly condensed directions—in case the route arrows were missed—very full tables of intermediate and total distances out and home, columns for check timing, and instructions for the checks, the latter printed black for the outward journey and red for the homeward trip, together with the most important of the governing regulations.

Mr. Frank Thomas, the hon. secretary of the event, had the route arrowed locally from each end late on Friday, and was out on the road by 3 a.m. on Saturday to make certain that everything was in order, and to this official many of the competitors, through the medium of *The Motor Cycle*, desire to tender their appreciation of his splendid organising capabilities.

Timekeeping and Checking.

The problem of agreement between timekeepers' watches *en route* was simplified by an official travelling ahead of the men who checked all the watches outwards to Coventry and repeated the checking homewards, leaving nothing to chance.

Advantage was taken of the organisation to include a class for members on solo machines, this being supported by fourteen competitors. The "open" class was confined to passenger machines, with thirty-three competitors, made up of twenty-seven sidecars and six cyclecars.

The starting point was at the top of Hampstead Heath, whence the first driver was despatched promptly at 7 a.m. *viâ* the lanes to Edgware, up Brockley Hill, across Bushey Heath, through Watford, Tring, Aylesbury, Bicester, Banbury, down Sunrising Hill, through Ettington, Warwick, Kenilworth, and on to the King's Head Hotel at Coventry, 102 miles. There was a non-stop section from the start to Aylesbury, the return journey being over the same route, and the non-stop section being Coventry to the summit of Sunrising, this latter section also terminating a timed schedule.

The weather conditions were good, the rain clouds only dropping a sprinkle for a couple of minutes in the morning, the remainder of the journey being made more pleasant by just enough sunshine. Going out, the only unfortunate driver in the non-stop section was W. O. Oldham (6 Bat), with a punctured rear tyre close to Tring, who, making a smart repair, was able to run in on time at Aylesbury. Near Banbury, H. J. Pooley (3½ Premier) was thrown by a big dog. Pooley turned a double somersault and landed on his hands; although wearing thick gauntlet gloves, his left hand was badly lacerated, but he pluckily continued and ran back home to time on the damaged machine.

Banbury was fateful for another N.W. London man, C. Williams (8 Chater-Lea sidecar), an exhaust valve rocker breaking in the timing gear case and causing his retirement. A. G. Clayton (3½ Humber sc.), running dead to schedule within a mile of Coventry, was stopped by a choked carburetter jet, and was a couple of minutes late. E. W. Ashworth (8 Chater-Lea sc.) stopped a mile or two earlier, and after spending half an hour to locate the trouble was exasperated to discover it was only a wad of fluff in the fuel pipe. Almost within sight of the luncheon spot Glyn Rowden (3½ Triumph) was put out of the contest by engine trouble. Osmond Hill (8 G.N. cyclecar) punctured near Warwick, and had a repetition of the trouble in control at Coventry; as repairs were prohibited in control, and he would have suffered a possible double penalty on the non-stop section, he retired.

Performances on Sunrising Hill.

The centre of interest on the return journey was Sunrising Hill, and arriving there with hot engines a number of failures were expected, but few were recorded. The star performances were made amongst the single-cylinder sidecar machines by J. R. Haswell, who achieved a surprisingly fast ascent upon a 3½ Triumph with the two-speed Triumph bottom bracket gear, and A. G. Clayton (3½ Humber sc. with Humber hub gear), who punctured the rear driving wheel tyre near the foot of the hill, but reached the summit without a falter.

So far as we could learn from the officials, the failures were: G. B. Coombes (7 2-sp. Indian), J. Gibbs (2¾ 2-sp. Humber), P. C. Dewhurst (3½ Rudge), E. G. Westacott (3½ Zenith-Gradua), W. P. Tippit (3½ 2-sp. Humber sc.), and W. S. Percival (3½ 2-sp. Humber sc.), the two latter dropping their passengers. The five cyclecars all made good ascents. Miss L. Berend (4 O.K.-Precision sc.), after climbing the hill well, had to retire at Aylesbury with a burst cover.

The following completed the journey in schedule time, but the awards will depend upon the intermediate checks:

SIDECARS.—WOOLWICH M.C.C. TEAM.

C. R. Collier (8 Matchless)	H. A. Collier (8 Matchless)
R. E. Guest (8 Matchless)	J. Tassell (8 Matchless)

STREATHAM AND DISTRICT M.C.C. TEAM.

R. G. Mundy (4 Singer)	W. O. Oldman (6 Bat)
S. T. Tessier (6 Bat)	

COVENTRY AND WARWICKSHIRE M.C. TEAM.

J. R. Haswell (3½ Triumph)	C. T. Newsome (3½ Rover)

N.W. LONDON M.C.C. TEAM.

A. C. Robins (3½ Humber). (Other members of team retired.)

SUCCESSFUL SIDECAR MACHINES.

Frank Smith (5-6 Clyno)	Hal Hill (8 Zenith)
H. W. Lambert (8 Chater-Lea)	W. P. Tippit (3½ Humber)
A. S. Phillips (8 V.S.-Jap)	W. S. Percival (3½ Humber)
A. J. Dixon (4 Singer)	F. S. Wheatland (6 Matchless)
J. Oliphant (3½ Premier)	

CYCLECARS.

Fred Hill (5-6 A.C. Sociable)	H. Morgan (8 Morgan)
J. T. Wood (8 G.W.K.)	E. Wilmott (8 Morgan)
G. M. Keiller (8 G.W.K.)	

MEMBERS' SOLO CLASS.

H. J. Pooley (3½ Premier)	Eric Rose (3½ P. and M.)
W. Cooper (3½ Bradbury)	P. H. Goddard (2¾ Douglas)
H. Bean (6 Matchless)	G. B. Coombes (7 Indian)
L. Joiner (3½ Brown)	J. Gibbs (2¾ Humber)
G. H. Hollis (2¾ Douglas)	P. C. Dewhurst (3½ Rudge)
H. Karslake (3½ Rover)	E. G. Westacott (3½ Zenith)

Dublin and District M.C.C.

The flexibility trial, held on the 18th inst., came to an abrupt termination by an unfortunate accident to R. Dunphy, which resulted in a compound fracture of his leg.

Scarborough and District M.C.

The third annual speed trials will take place on Whit-Monday on a new course which gives an excellent straight mile. Seven classes for all types of motor cycles have been included. H. D. Shaw, the present holder of the Webster trophy, is again competing in the "all-comers'" class.

Herts County M.C.C.

At a meeting of Herts County motor cyclists, held at the Red Lion, Hatfield, on the 15th inst., it was decided unanimously to start a county club catering solely for motor cyclists. Two hon. secretaries were elected, Mr. E. C. Jarvis and Mr. C. C. Cooke. The former will be responsible for members' events, and the latter for open events.

Willesden Green C. and M.C.C.

The first competition was held on the 11th inst. and took the form of a speed-judging and reliability trial over a circular course to Huntingdon and back. Owing to the severity of the course only eight finished to time. Result: A. W. Loughlin (3½ Triumph), 1st; C. N. Stafford (3½ Humber), 2nd; and W. J. Turner (3½ Triumph), 3rd.

Pontefract M.C.C.

The annual speed trials on Thursday last were held in Byram Park by permission. The bad weather, however, practically spoilt the event, and the slippery road made very fast speeds impossible.

In the half-mile flying start the result was: H. Craven (3½ Triumph), Capt. Smith (3½ Bat), and E. Lees, winner of the multi-cylinder class (3¾ Scott). Fastest time of the day was made by R. Gill on a 3½ Rudge.

Ilkley and District M.C.C.

The Founder's Trophy Reliability Trial was run off last week. This year the course was as follows: Ilkley, Skipton, Gisburn, Hellifield, Grassington, Pateley Bridge, where two hours were allowed for lunch, thence *viâ* Ripon, Harrogate, Skipton, to Ilkley. There were twenty entries. The winners of the trial proved to be as follows (handicap results):

1. Walter Mangham (3½ Premier and sc.), the Founder's Trophy, the club gold medal, and special gold medal for the best performance by a novice.
2. Roy Cowling (3½ Matchless), the club silver medal, and special gold medal for perfectly clean schedule.
3. B. Platt and A. Claughton (3½ Triumphs), the club bronze medals.

Westmorland M.C.C.

A hill-climb was held on the 16th inst., on a local hill named the Greyhound. Results:

SINGLE-CYLINDER CLASS.

		Time.	Formula.
1.	G. W. Braithwaite (3½ Zenith) ...	51s.	64.6
2.	B. Jefferys (3½ Triumph)	57s.	70.5
3	R. Bownass (3½ Matchless)	51⅘s.	78.6

TWIN CLASS.

1.	L. S. Parder (3½ Scott)	55⅖s.	£2.4
2.	J. W Nelson (3½ Scott)	62s.	£5.1
3.	R. Shaw (3½ Scott)	65s.	£8.1

Fastest time of day.—A. J. Moffat (6 Zenith), 50s.

The A.C.U. having disqualified a competitor for having ridden a machine which was not his own property in Class 9 (amateur class) of the Brigsteer open climb (Easter Monday), F. W. Barnes takes the prize for fastest time of the day.

York County M.C.C.

The annual hill-climb was held on the 12th inst. The hill was near Glossop and rises 1,500 feet in two miles. Results:

1.	M. Ruckley (8 Zenith)	X
2.	J. A. Prendergast (3½ T.T. Rudge) ...	+11
3.	A. McConnochie (5 Indian)	+18

Knock-out races (handicap).

Final.—McConnochie (5 Indian) beat Waterman (6 Bat).

Coventry and Warwickshire M.C.

The annual Welsh run is fixed for Saturday, June 1st, starting at 7.30 a.m., and journeying *viâ* Shrewsbury. Lunch will be taken at Lake Vyrnwy (104 miles) at 1.30 p.m., and the afternoon spent there. In the evening a move will be made for Llangollen, and the next day members will attempt the mountain road between Bala and Dinas Mawddwy, returning home in the afternoon.

Manchester M.C.

The first competition of the season took place on the 18th inst. in delightful weather. The hill was the usual one at Heyden Bridge, and the course was a mile in length. The competitors were handicapped on weight and h.p., so many seconds start being allowed and the riders sent up in pairs. The fastest time was accomplished by H. Marsden (7-9 Matchless) in 1m. 15s. Results:

		Weight lbs.	H'cap. secs.
	SINGLE-CYLINDERS.		
1.	J. Smith (3½ Triumph, private) ...	328	12
2.	H. Taylor (3½ Bradbury, private) ...	315	12
3.	W. Munroe (3½ Rover, trade) ...	335	12
	TWINS.		
1.	H. Marsden (7-9 Matchless, private)	590	8
2.	J. McCann (7 Indian, private) ...	413	5
3.	F. Sirett (7 Indian, trade)	378	scr.
	SIDECARS.		
1.	H. Bottoms (3½ Triumph, trade) ...	540	25
2.	P. Platt (3½ Bradbury, trade) ...	604	10
3.	W. Miles (3½ Humber)	—	—

Sheffield and Hallamshire M.C.C.

The club held its speed trials on the 18th inst. in a by-lane near Baslow, Derbyshire. The day was delightfully fine, and a large gathering witnessed some fast speeds on a course which was not by any means level. The first 150 yards were on a slight down grade, but the remainder of the course had an up gradient of 1 in 20. The course was 1,100 yards long, and a flying start was allowed. Results:

CLASS I.—Lightweights.

1.	J. Haslam (2¾ Douglas)	55⅖s.
2.	H. Dakin (2¾ Douglas)	64⅘s.
3.	W. Torr (2¾ Douglas)	93⅖s.

CLASS II.—Standard Single-cylinders.

1.	D. Bradbury (3½ Norton)	38⅕s.
2.	J. A. Stacey (3½ Rudge)	45⅖s.
3.	S. Sawer (3½ Premier)	45⅗s.

CLASS III.—T.T. Single-cylinders.

1.	J. Nicholson (3½ Campion)	40s.
2.	J. Haslam (3½ Premier)	40⅖s.
3.	F. H. Ronksley (3½ Rudge)	43⅕s.

CLASS IV.—Standard Multi-cylinder Machines.

1.	E. L. Moxey (8 Matchless)	35⅖s.
2.	C. E. Nicholls (8 Zenith)	36⅕s.
3.	R. Garnett (6 Matchless)	37s.

CLASS V.—For any Machine.

1.	C. E. Nicholls (8 Zenith)	35⅘s.
2.	E. L. Moxey (8 Matchless)	36⅖s.
3.	D. Bradbury (3½ Norton)	37⅕s.

The timing was mechanical, and was in the hands of Mr. J. W. F. Tranmer, of Scarborough, his ingenious contrivance eliciting much favourable comment.

Club News.—

Central Technical College M.C.C.

This club has been revived after two years, and has at present a membership of thirty.

A members' hill-climb was held on May 4th, on a hill leading out of Wooburn, off the main Oxford Road. The gradient is not very severe, the average over the whole length being 1 in 10, with a pitch of 1 in 7 on the top corner. Results.

CLASS I.—Lightweights, 350 c.c.

1. S. H. Dring (2¼ F.N.) ... ... 46⅘s.
2. S. N. Pocock (2¾ Douglas) ... ... 62⅖s.

CLASS II.—Touring models, 600 c.c.

1. R. Firth (3½ Zenith) ... ... 24⅘s.
2. H. D. Lewin (3½ Triumph) ... ... 26⅗s.
3. E. F. Elderton (3½ Zenith) ... ... 27⅕s.

CLASS III.—T.T. models, 600 c.c.

1. A. T. Richards (3½ Rudge) ... ... 24⅖s.
2. M. G. Drew (3½ Zenith) ... ... 25⅖s.
3. E. L. Buchanan (3½ Norton) ... ... 28s.

CLASS IV.—Open.

1. R. Firth (3½ Zenith) ... ... 20⅖s.
2. G. S. Drew (6 Zenith) ... ... 23⅗s.
3. A. T. Richards (3½ Rudge) ... ... 24⅖s.

CLASS V.—Sidecars.

1. G. S. Drew (6 Zenith) ... ... 32⅖s.
2. H. H. Bagnall (8 Chater-Lea) ... ... 40s.

Surrey M.C.C.

An inter-team reliability trial, extending from Guildford to Arundel, by way of Petworth and Bury, and returning to Milford by way of Petworth and Midhurst, was held on May 15th.

Competitors were required to make non-stop runs, and the performances on Bury Hill were carefully observed. The following made non-stop runs:

	Marks lost.
S. H. Crow (3½ Zenith-Gradua)	1½
C. A. Crow (8 Chater-Lea)	2½
P. Kirk (3½ Triumph)	4
F. A. McNab (3½ Trump-Jap)	5
H. R. Owtram (3½ Triumph)	6½
H. Mitchell (3½ Premier)	7½

Hants Motor Cycle Union.

Owing to the kindness of Lord Ashburton who allowed the use of his park at The Grange, the Hants M.C.U. were able to hold a most successful hill-climbing contest. Results:

CLASS I.—Under 340 c.c.

Entrant, Machine, and Club.	Marks.
1. S. J. Rogers (2 Humber), Southampton ...	.024

2. R. Rimmer (3½ Triumph)	109.85

CLASS VII.—Sidecar Class.

1. Graham Dickinson (3½ Triumph and sc.)	74.20
2. W. Bolton (6 Enfield and sc.)	85.93

Bishop Auckland, Darlington, and District M.C.

The above club held a hill-climb on Penny Bank, near Barnard Castle, on Wednesday, the 24th ult. The results on the formula $\frac{T^2 \times C}{W}$ as recommended by *The Motor Cycle* were as follows:

Class I., Touring Singles.—1, P. Kirkup (Triumph); 2, H. S. Moon (2¾ New Hudson); 3, H. N. Hull (Zenith).

Class III., T.T. Singles.—1, C. W. Smith (Smith-Precision); 2, J. P. Forster (T.T. Rudge); 3, F. G. Wake (T.T. Triumph).

Class IV., All-comers.—1, C. W. Smith (Smith-Precision); winner of Triumph gold medal; 2, H. Mason (Matchless); 3, F. G. Wake (T.T. Triumph).

Class IV., Sidecars.—1, A. B. Hare (T.T. Triumph and sidecar); 2, E. C. Presland (Chater-Lea and sidecar).

A G.N. cyclecar owned by F. Thomas which took part in the N.W. London M.C.C. trial last Saturday. Miss Thomas is seen at the wheel.

SON TYRES

TSUNTIDE

FOR SOLO WORK

Taken from another recent testimonial.

"Delightful to forget you have tyres. Up till now have completed 8,000 miles without a puncture."
(Signed) A. J. ATTWOOD, Lansdowne Gardens, S.W.

¶ What the "Passenger" Type Cover is to the sidecar combination so the

Hutchinson 'Tourist Trophy" Rubber Studded

is to the solo machine of 3½ h.p.

Just as much care is exercised in its manufacture, just as fine materials are used. It is the correct tyre for the power and will be found to give complete satisfaction.
If your machine does not exceed 3½ h.p. fit the Hutchinson "Tourist Trophy" cover and forget you have tyres.

Clerkenwell, E.C.

1,000 miles without any trouble whatever!

81, Cranwich Road,
Stamford Hill, N.
2nd April, 1912.

"When ordering my 1912 mount last year, I arranged for 'Palmer Cords' to be fitted.

In view of the disgusting weather we have had since November last, I think you may care to know that in the course of just upon 1,000 miles I have not had the vestige of a side-slip, puncture, or any tyre trouble whatsoever. If I were to take off the tyres and send them to you, I think it would tax even your expert knowledge to pick out which was on the back wheel, so slight is the wear. The immunity from side-slip given by the three large ribs has astonished me."

C. R. GRIFFIN.

PALMER CORD TYRES HAVE NO EQUAL FOR TOURING.

Club News.—

Bristol B. and M.C.

The reliability trial to Taunton and back attracted seventeen starters, of whom fourteen made non-stops. The winner was L. E. Scammell (3½ Rex).

Walthamstow M.C.

A non-stop and speed-judging competition was held to Newmarket and back on the 12th inst. Results: 1, A. G. Peppercorn (3½ h.p. Bradbury), silver cup and gold medal; 2, A. Shelley (6½ h.p. Humber and sidecar), gold centre silver medal; 3, W. S. Low (3¾ h.p. Scott), gold centre silver medal.

South Birmingham M.C.C.

The first speed-judging competition was held on the 13th inst. to Bewdley. Result:

	Time error.
J. Percox (3½ Allday)	1m. 15s.
F. W. Merrick (6 Enfield sc.) ...	2m. 10s.
W. E. Bayliss (3½ New Hudson) ...	2m. 10s.

North-Eastern A.A. and Bishop Auckland, Darlington, and District M.C.

A team trial under the auspices of the above association was held recently. The course, which was a severe one, included Sutton Bank, Lythe Bank, and Salthurn Bank, and the distance the competitors had to travel was about 142 miles. Owing to the morning being wet and cloudy, only five teams turned out; each team consisted of three riders and the winners proved to be: C. Shaw (3½ Triumph), H. N. Hull (3½ Zenith), and G. Wilson (6 Zenith). Each rider in the winning team receives a small N.E.A.A. silver cup and a butt-ended tube.

Derbyshire and North Stafford A.C. (Motor Cycle Section).

Speed contests took place on the 11th inst. over a perfectly straight, level course, the distance being one kilometre from a standing start. Results:

Event I. (For Members of the D. and N.S.A.C. and the Derby and District M.C.C.)—1, A. F. W. Greeves (Triumph); 2, D. C. Bolton (Martin).

Event II. (For Members of the D. and N.S.A.C.)—1, F. S. Linnell (Bradbury); 2, D. C. Bolton (Martin).

Event III. (A Scratch Race for Members of the D. and N.S.A.C.; touring machines.)—1, A. F. W. Greeves; 2, J. Birchenough.

North Middlesex M.C.C.

A petrol consumption test was held on the 11th inst. at Totteridge. The results were worked out on formula, the highest figure of merit showing the winner. The first three are: M. Abraham (Indian), 389.6; P. Dangerfield (Douglas), 320.6; S. F. Garrett (Triumph), 286.3.

Scarborough and District M.C.C.

The club's spring reliability trials were held on the 11th inst., when the course of ninety miles was from Scarborough *viâ* Seamer, Flixton, Hunmanby, Kilham, Driffield, Beverley to Hornsea (tea control), and back *viâ* Carnaby, Bridlington, Cayton Cliffs to Scarborough. D. Bradbury, of Sheffield (3½ Norton), was first of the motor cyclists, losing only eleven marks.

Leven and District M.C.C.

A hill-climb was held recently at Cadger's Brae, near Pitlessie. Results: Class II. (singles): 1, O. C. Braid (T.T. James); 2, R. J. Braid (T.T. Norton); 3, J. Cameron (T.T. Bradbury). Class III. (twins): 1, A. J. Carlow (6 Rex-Jap); 2, W. Carlow (6 Bat-Jap); 3, T. C. Balfour (6 Bat-Jap). Class IV. (unlimited, confined): 1, S. O. Shepherd (8 Dot-Jap), 35s.; 2, A. J. Carlow (6 Rex-Jap), 37⅕s.; 3, R. J. Braid (3½ T.T. Norton), 38s. Class V. (unlimited, open): S. O. Shepherd (8 Dot-Jap), 33⅗s.; 2, R. J. Braid (3½ T.T. Norton), 35⅘s.; 3, J. G. Beveridge (T.T. Triumph), 36⅗s.

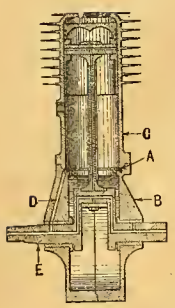
Norfolk M.C.C.

A members' hill-climb was held at Ringland recently. The distance is one-fifth of a mile and the rise 105ft., giving an average of 1 in 10. Results:

Class I., Touring Machines on Formula.—1, R. O. Clark (2¼ h.p. F.N.); 2, A. Adcock (2¼ h.p. F.N.); 3, H. G. Brown (3½ h.p. Rudge).

Class II., Flexibility.—1, F. C. North (3½ h.p. Ariel); 2, E. L. Mills (2¾ h.p. Douglas); 3, E. M. Wood (3 h.p. N.S.U.).

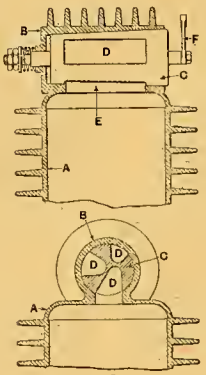
Class III., 500 c.c. and under.—1, G. Boswell (3½ h.p. Ariel); 2, R. O. Clark (3½ h.p. L.M.C.); 3, F. C. North (3½ h.p. Ariel).



Class IV., Unlimited.—1, R. O. Clark (7 Indian); 2, G. Boswell (3½ h.p. Ariel); 3, A. Adcock (3½ h.p. L.M.C.). Clark made fastest time of the day in this event.

Class V., Sidecars.—1, R. O. Clark (2¼ h.p. F.N.); 2, R. Attwood (5 h.p. F.N.); 3, H. Gill (7 h.p. Indian).

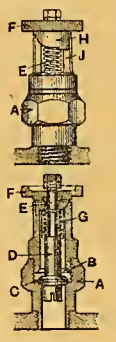
Inaugural meeting of the Luton and South Bedfordshire M.C.C. at the Rose and Crown Hotel, Tring.



Engine Lubrication.

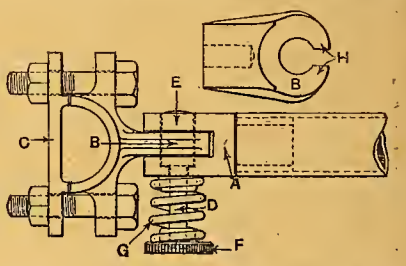
The particular feature of the invention illustrated (it is shown applied to an engine of the two-stroke type) is an arrangement of a groove A at the top of the crank case B, which is adapted to collect oil draining from the cylinder walls C, and conveying it by means of a duct to the pulley side crankshaft bearing E.—W. H. Butterfield, No. 659, 1912.

A Variable Compression Device.



Cast with the cylinder A is a chamber B, which receives a plug C, provided with recesses D of different capacity. These recesses may be put into communication with the cylinder by means of a port E, the plug C being provided with a handle F for this purpose. The result is that a reduction of the compression ratio is produced varying in proportion to the capacity of the recesses D.—W. E. Groves, No. 6,508, 1911.

PATENTS by Eric W. Walford A.C.I.P.A.



A Decompressor.

Screwing into the cylinder is a hollow metallic body A, which is provided with valve seats B C. With these valve seats co-operate a double-acting valve D provided with an upwardly projecting stem E, having a milled knob F at its upper end. Between the valve D and the upper end of the casing A is arranged a coil spring G. The knob F has a face cam H on its lower surface adapted to engage projections J on the upper part of the casing A. In operation, with the parts in the position shown in the sectional drawing the engine compression raises the valve D to a position between the valve faces B C, allowing a portion of the charge to escape until the pressure is reduced sufficiently to permit of the spring G returning the valve D to the seat C, when no further loss takes place, and a reduction of compression is obtained dependent on the strength of the spring G. For ordinary running the knob F is rotated, causing its cam face H to engage the projection J on the casing, and drawing the valve D normally on to the seat B, preventing any loss of compression.—F. Guest, No. 22,896, 1911.

A Sidecar Joint.

The detachable member A is forked and adapted to receive a projection B carried by the clip C. The member A is provided with a boss through which passes a bolt D, having an enlarged bead E at one end and being provided with a milled knob F at the other end, a spring G normally keeping the various parts in the position shown. To attach or detach the sidecar, the bolt D is pressed inwards, releasing the enlarged part E from the aperture in the portion B. The eye in B is slotted out at H to allow it to pass over the smaller portion of the bolt D.—J. W. Scott and C. T. Rhodes, No. 21,973, 1911.

A New Model.

At their new showrooms in High Street, Kensington, John Barker and Co., Ltd., have examples of the new Barker-Fafnir on view and ready for immediate delivery.

Tyres and Belts in Scottish Hill-climb.

Competitors who used Dunlop tyres and belts in the Glasgow M.C.C. hill-climb at Howwood, described last week, did uncommonly well, capturing amongst them four first places and three seconds, besides making fastest time in the touring class.

Lubricants for Racing.

Wakefield Castrol lubricating oil has been used in many recent successes on road and track. This oil is favoured by F. W. Barnes, the Zenith rider, who used it when he broke the Class E hour record with sidecar, and established records for fifty and 100 miles and two hours. It is marketed by C. C. Wakefield and Co., 27, Cannon Street, London, E.C.

A Leather Chain Belt.

Mr. R. Sleigh, Victoria Road, Ellistown, near Leicester, has sent us a sample of a leather chain belt which we illustrate. The sketch is self-explanatory, but it is perhaps advisable to point out

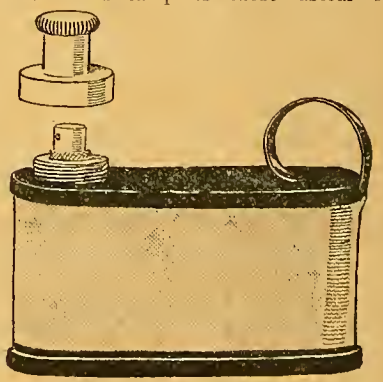
that the links are wholly composed of leather fastened together by screws. The patentee informs us that this design does not infringe on any other chain belt and gives satisfactory results.

SPARKLETS

Guide to the British Isles.

The 1912 edition of the "Michelin Guide to the British Isles" has been enormously improved since it was first published, and the addition of many small villages in which there are good hotels is a welcome one. Its list of tours, towns, hotels, repairers, and maps of towns and country are all of invaluable assistance to the motor cyclist. It is a most useful publication for the motor cycle tourist. The new French edition has also been considerably augmented and improved. Both publications may be had on application to the Michelin Tyre Co., Ltd., Sussex Place, South Kensington, S.W.

Trade Announcements.



Owing to the rapid increase of the business of Messrs. Rushmore Lamps, Limited, further capital is required, and it has been considered advisable, in order to obtain this, to form a new company of the same name, with the result that the present company will go into voluntary liquidation. We are requested expressly to point out that the company is going into liquidation solely for the purpose of reconstruction, and that all debts will, of course, be paid in full.

Special Sidecar Tyres.

The North British Rubber Co., Ltd., have produced a tyre specially for use on sidecar wheels. It has been submitted to very stringent tests, both in the laboratory and on the road, and has been found satisfactory in every way.

A Handy Blow Lamp.

H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W.C., have sent us a small blow lamp which we illustrate. This lamp is most useful for

small soldering jobs and is very simply constructed. All that is necessary is to remove the tubular wick-holder, fill the reservoir two-thirds full with methylated spirit, and apply a light to the burner. In a few moments an intensely hot flame issues horizontally from the small hole in the burner. The lamp is quite small and may be carried in the toolbag if desired.

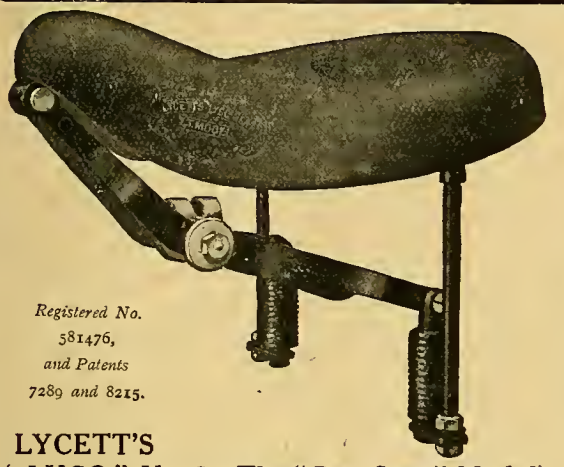
"Efficient WHITSUN Equipment" —ideally found in the "Good LYCETT Lines."

—Make the Whitsun Holiday really enjoyable by seeing that your mount is well equipped with the following Equipment—items so essential to your comfort, convenience, and pleasure awheel.

—In the "Good Lycett Lines" you'll find every need most adequately catered for. Note these items:—

LYCETT'S "LYCO" PAN SEAT is unquestionably the most perfect saddle for comfortable and easy riding with it. No chafing or fatigue, its luxurious Anti-vibratory action eliminates all strain, shock, and jar.

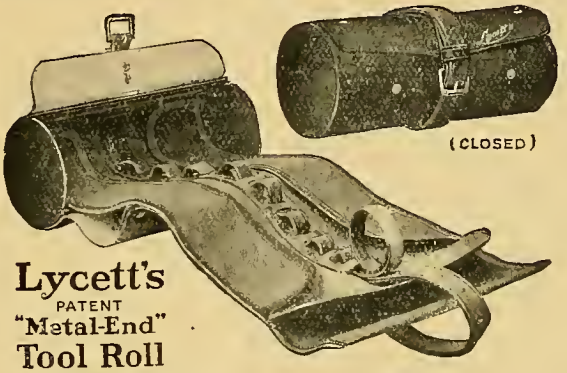
LYCETT'S "LYSO" BELT is the acknowledged perfect Power-transmitter. Its scientific design ensures a clean easy drive, utilising every ounce of power the engine supplies.



LYCETT'S "METAL-END" TOOL ROLL. The ideal tool carrier for silence, security, and accessibility. The metal ends prevent tools falling out, protect them and keep them in orderly arrangement.

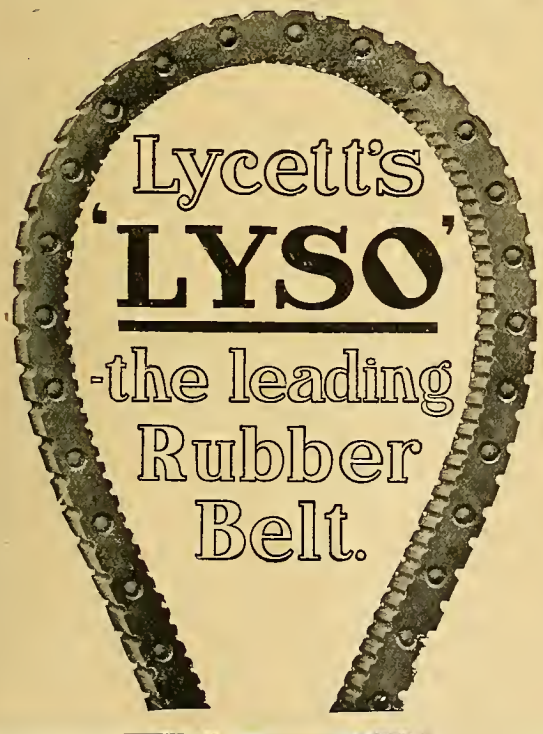
LYCETT'S "ATTACHE" BAG is an essential luggage carrying item, capacious and convenient. It can be opened on carrier or removed complete in an instant as desired. No annoyance of straps to undo.

LYCETT'S CARRIER-SIDE BAG is very neat and compact bag for holding small tools and spares, with gusset front and patent lock which cannot jolt open. Fits securely on carrier by patent clips. No straps.



—Obtainable of all Agents, Garages, etc., or direct. Catalogue free per return.

LYCETT'S, "The Saddlery," Bromley Street, Birmingham.



Registered No. 581476, and Patents 7289 and 8215.

What the Judges said

in their report of the A.C.U. Trial, held on April 24th last under the heading of tire troubles:

"Four first class certificates were lost through this cause. It would appear to be highly desirable, in view of the greatly increased horse power developed by modern engines, that heavier tires should both be made for use on motor cycles and actually fitted to them as standard."

The above precisely confirms what we have been saying for the last two years—and actually practised.

Our tires are easily 50% stronger and heavier than any other standard tire on the market to-day.

They are not in any sense exaggerated cycle tires, but designed specially for motor cycles, and made to withstand the strains of high-powered modern engines, and endure long distance touring without giving the slightest trouble.

We do not make special tires for specific purposes to cover certain distances, and advertise the result as obtained on standard tires.

Tires selected at our agents are as good as any taken from our own stock, and altogether more reliable than tires specially made for competition purposes.

or any power 15% to 25%.

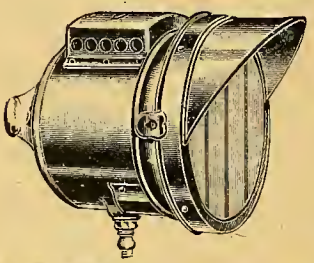
This side shows Jones & Co.'s Patent Jet delivering petrol as vapour to engine.

This side shows your jet delivering petrol in liquid to the engine.

HOW?
By having Jones and Co.'s Patent Jet Petrol Atomiser fitted in exchange for your old jet. This patent delivers the petrol to engine in thousands of particles instead of in liquid.

WHY?
This causes the vapour to be properly exploded instead of burnt; saves the piston head from being carbonised, and gives at least 15% to 25% more power.

WHO SAYS SO?
Expert riders of world repute. Copies of testimonials free.



WHAT GUARANTEE?
Your money returned within 14 days if the jet does not improve your engine 15% to 25%.

ANY CARBURETTER
fitted. Send your old jet, or give exact particulars of your carburetter. *From any good Agent, or*

See that Security Sleeve ?

It overcomes the one disadvantage of the Butt-ended Tube—bursting at the ends. It is the feature of the **"Challiner" Patent Butt-ended Tube.** With it you have the security of the endless tube and the handiness of the butt-ended one.

The Security Sleeve is fixed to the rim by the winged out and bolt; the butt ends of the tube fit in it like a glove.

The centre of the Security Sleeve is a bulkhead of insulated canvas which makes *bursting of the ends an impossibility.*

'Challiner' Patent Butt-ended Tubes are burst-proof at the ends.

If a tyre fitted with this tube were inflated to bursting point, *the burst could not occur at the ends.*

The bulkhead keeps the Tube ends firmly in position; and being fixed to the rim directly opposite the valve, it prevents all 'creeping.' "Creeping" of the Butt-end Joint is what cause other tubes to burst.

Fit "Challiner's" to your mount now!

E.H.C.

STOCK-TAKING CLEARANCE SALE

With the end of April comes the end of our half-year, and we wish to reduce the enormous stocks that are on hand.

There are close upon 100 Second-hand Motor Cycles left, and these are taking up room which should be occupied by 1912 Motor Cycles, A.C.'s, Morgan Runabouts, and other things that are on order; therefore, we want your assistance in disposing of the 100 machines above-mentioned. The way to help is to send for a list, and, when you get one, spot a machine to suit you, making us a cash offer, and we will try to take it.

During the past month we have sold close upon 100 machines to the Sunny Jims who were smart enough to pick up the bargains. We have plenty of same for everybody, but by Whitsuntide we shall have a lot of them cleared out. It is very easy to do if you will only try. You want a machine, and we want to sell you one, and what is easier than to fix up a deal at once. You can take 10% to 20% off our list price of many second-hand machines. If you are unable to pay the cash, you can have one on the deferred at one-third down and the balance by instalments. We also sell new machines at one-quarter down and the balance payable by instalments within twelve months. REMEMBER that we are out to shift the stuff, and that we want your assistance. Also, remember our system of business—this is simplicity itself. You send your money for a machine, and if the machine is not as specification, you are at liberty to return same within three days and have your money back in full, and we are at all times pleased to exchange. Don't forget this! You can't go wrong, and no one will treat you as well.

In going through the stock, we find that there is an enormous glut of new and second-hand accessories, which are taking up space that ought to be occupied with new machines. This tackle we want to shift. Amongst the most notable things are:

A quantity of Huot's H.H. Coils, brand new, but slightly shop-soiled, and these you can have at half a guinea a time to clear them out. There are also 250 pairs of Morecambe Covers, all sizes, which you can have at our usual prices: 15/11½, 19/11½, and 24/11½, less 10% during the sale. 300 Tubes at our list prices of 4/11½ and 8/11½; and Butt-ended Tubes, 12/11½, less 10% during the sale. Quantity of Second-hand Nab Seat-pillars; 5/6 a time will do the trick; better ones 7/6, shop-soiled ones 9/6. About 50 Pairs of Mudguards, listed at 3/11½; we are clearing them out at 3/3. 97 Handle-bars, all shapes and sizes, at the uniform price of 4/5½; Triumph pattern Bars, 4/9. Swan-neck Seat-pillars, 2/5½. Generators galore: New ones, 3/11½ and 4/11½; Second-hand ones from 2/6, not guaranteed, but one pennyworth of solder will cure them. Dozens of Lamps, self-contained, from 4/11½ a time; don't, however, expect a guinea one at the price, but they are all right. Separate Generator Lamps from 2/11½, Second-hand Bags, hundreds to pick from, 2/6 a time; new ones, see our list. 85 Brand New Wilby Saddles, 7/11½. 56 Second-hand Saddles, Brooks's, Lycett's, and other kinds, from 7/6 to 12/6. S.H. XL'All Spring Forks, 8/11½. A few 7½ft. lengths of ¾in. Rubber Belts, 6/11½. 100 Pairs of Goggles, 1/5½. In Gloves we have a matter of 100 pairs, real leather gauntlet gloves, 4/5½. A few wool-lined ones, for winter wear, same price. Special line of Belt Fasteners, whilst they last, 5½d. a time, post free. To those Sunny Jims who want a carrier on which to take out their best girls, we will sell one at 4/5½, but there is no insurance policy with them. At the same time, the lady will be far safer in a sidecar, and you can have one of these, while the sale lasts, at 10% off our list price. We have also got a lot of Second-hand Price's Stands. These have been gathering up during the winter, and we want to shift them. They are all right, and you can have them at the very low figure, whilst the stock lasts, at 5/5½. You can have new ones, 7/6. These are the genuine article, and marked "Ukantes." We have also a lot of Rubber Belting about, and we are knocking off 4d. per foot. If you look handy, you will get one before they are snapped up. We have also plenty of Suits of Overalls, and if 13/11½ is too much, you can have one at 12/11½, and, if THAT is too much, you can have a Holland Summer Suit at 7/11½. There are not many of these left, and if you want one, you will have to be quick about it. We are out to sell them while they last. We have plenty at a higher price, if you fancy giving 25/- for a 30/- suit. We have also 49 Coils, tremblers and non-tremblers; these are not guaranteed, and if you like to send us 2/11½ you can have one. The same remarks apply to Accumulators; you can have these at 1/11½ a time, whilst they last. We have a few Dry Cells, that have been used, and you can have them at the same price. We have also a few Carbide Carriers left, 1/8½. We have a box of Bowden Controls; these are the genuine article, slightly rusted, but no worse for that. You can have these at the ridiculous price of 6/11½, proper price 9/6. Dozens of Horns and Hooters, 1/5½ each. Pumps by the dozen, while they last, 11½d. Besides these, there is any amount of stuff, far too numerous to mention in the space at our disposal. If you will only say what you want, we will find you something to suit you. We can find you a motor bike for a matter of fifty bob—in fact, we have one or two that are complete and in running order, 50/- a time. Don't be alarmed, we are not going bankrupt, neither are we making a private arrangement with our creditors; but we are simply shifting the stuff so that we may have room in which to move about. If you have been to Morecambe you will know what we mean. We have £5,000 worth of stuff in our place, which in reality is only large enough to contain £1,000; and what between ourselves and the Canaries we have not room to stir. By the by, we have a few Car Lamps that we have just spotted; these will be all right for your Morgans, A.C.'s, and flying machines, etc., and you can have them at from half a guinea a set. There are not many of them, so, if you want one, let us have your order quick. We have still plenty of Tube and Belt Cases, which you can have at the ridiculous price of 5/5½. There are also a couple of dozen Fiery Magnets; these are all right, and will make a spark if you have any life in you, Three Guineas a time. To the Sunny Jims that ride chain drive machines, and do not have belts, we would remark that we have Tube Cases at 2/11½, which are dirt cheap at the price. All these are new, mind you! However, our compliments until next week.

Hitchen's, Ltd., Morecambe.

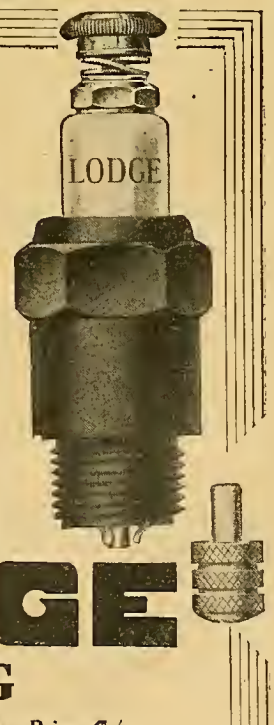
PAGETS PLAN

Pay for your Motor Cycle by Monthly Instalments.

There is now no need to wait until you have all the money before buying the motor bicycle you want. Instead of slowly saving up, and thus wasting all the glorious summer months in which you might be enjoying your bicycle, just take advantage of Pagets Purchase Plan and have your mount now. You merely pay one fifth down and make up the balance in 12 monthly instalments—or longer if desired.



We can usually arrange Early Deliveries of well-known makes.

Write to-day for details.

PAGETS LIMITED, 10 & 11, Jermyn Street, London, W.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

The proprietors are not responsible for clerical or printers' errors, although every c re is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Somerset, Devon, Dorset, and Cornwall.

SECTION X.
Scotland.

SECTION XI.
Ireland and Isle of Man.

WHITSUN HOLIDAYS.

Owing to the Whitsun Holidays, the Issue of "The Motor Cycle" for May 30th will be closed for press earlier than usual. All copy and instructions for paragraph advertisements in this issue must therefore be in our hands not later than first post on Thursday, May 23rd.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may l addressed to numbers at "The Motor Cycle" Offic When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be sen for forwarding replies. Only the number will appear i the advertisement. Replies should be addressed, "No ooo, c/o 'The Motor Cycle,' Coventry"; or if "London is added to the address, then to the number given, c/ "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown person may deal in perfect safety by availing themselves of ou Deposit System. If the money be deposited with "Th Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of th goods is three days; and if a sale is effected we remit th amount to the seller, but if not we return the amoun to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 i value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with a Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication th t the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each ne by post.

MOTOR BICYCLES FOR SALE.

NEW Hudsons; delivery from stock.—Sole agents for Suffolk, T. H. Nice and Co., Bury St. Edmund's, and Ipswich.

PREMIERS, all models; delivery from stock.—Suffolk agents, T. H. Nice and Co., Bury St. Edmund's, and Ipswich.

TRIUMPHS, Humber, Bradbury, B.S.A., Rudge, new and second-hand, also sidecars.—T. H. Nice and Co., Bury St. Edmund's, and Ipswich.

7h.p. 1911 Peugeot-Chater-Lea, excellent order, magneto, etc.; trial; accept £28.—Straker, 72, Jesus Lane, Cambridge.

MOTO-REVE, 2¾h.p. twin, magneto, perfect condition; £17, first cheque secures.—Burrel, Church Rd., Limbury, Luton.

DE DION, genuine, 3½h.p., Chater-Lea fittings, thoroughly reliable, excellent condition; £20.—G. E. Foster, Kempston, Beds.

TRIUMPH, 1912, free engine; £55; in stock; immediate delivery.—Triumph agents, Robinson's, Green St., Cambridge.

1911 F.E. Triumph, ridden 1,600 miles; only £42.—Triumph agents, Robinson's, Green St., Cambridge.

DOUGLAS, 1910, complete, good condition; £25.—Robinson's, Green St., Cambridge.

HUMBER, 1912, 3½h.p., 2-speed, in stock, no waiting; £52/10.—Robinson's, Green St., Cambridge.

HUMBER, 1912, 2¾h.p. twin, in stock, no waiting; £46/10.—Robinson's, Green St., Cambridge.

CLYNO, 6h.p., 2-speed; we can deliver absolutely certain 24th May; £68/5.—Robinson's, Green St., Cambridge.

ROBINSON'S Motor Bicycle Garage, Green St., Cambridge, Triumph agents. Tel.: 388. T.A.: Bicycles, Cambridge.

£11/10.—Motosacoche, 1910, spring forks, magneto, new Whittle and tyre, just overhauled; any trial.—French, 140, Foster Hill, Bedford.

CLUTCH Triumph, and 2¾h.p. 3-speed New Hudson, immediate delivery; 1911 Kerry, £27; Triumphs from £25; exchanges.—Wilderspin, Chatteris.

BRADBURYS for Whitsuntide; choice of two.—1912 standard, ridden 2 weeks, £44; 1912 2-speed, belt drive, unpacked.—Potter, Framlingham, Suffolk.

1912 Rovers, all models, 1912 2-speed Bradbury, and sidecars to fit above machines; in stock, immediate delivery; cash or exchange.—Young and Co., Newmarket.

POWERFUL 3½h.p. Minerva Motor Cycle, good condition, reliable machine, engine perfect, belt new, new Dunlop (back), 2 accumulators, tools, bags, lamp, spares, etc.; bargain, £15.—R. Ranson, School House, Earsham, Bungay, Suffolk.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

1912 F.E. Triumphs, Bradburys, Enfields, ready for the road.—Rose Bros., Bridgend, Glamorgan.

1912 B.S.A., free engine, brand new, ridden 20 miles; £51; no waiting.—Farrington, fruit grower, Evesham.

3½h.p. Rex, low, h.b.c., B. and B., Bosch, new, Dunlops, good tyres; £15, or near offer.—24, Cornwall St., Hereford.

3½h.p. P. and M., thoroughly overhauled by makers, and in perfect condition; £35 net.—Green, Haverfordwest.

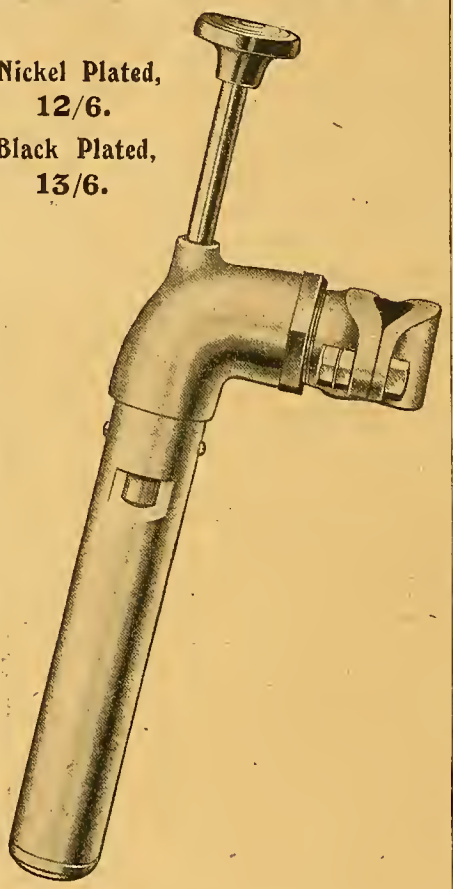
ARIEL 3½h.p. Decompressor, absolutely new, but 1911 late pattern; what offers?—Marriott, Motor House, Hereford.

3½h.p. N.S.U., magneto, perfect order, spring forks, adjustable pulley, 1909; £17/10.—Allen, jeweller, Crickhowell.

TRIUMPH, 1912, free engine, unpacked; also 1911 standard, great bargain, £35.—Gibbon, clothier, Pontypridd.

CLUTCH Triumph, 1912, in stock, and 6h.p. twin N.S.U., perfect; also forecar; what offers?—Thomas, agent, Aberfan.

NEW Hudsons.—Fred Morgan, Talgarth, can give prompt delivery of 1912 models; also a number of second-hand machines; enquiries solicited.



4h.p. Twin N.S.U., h.t. Bosch, B. and B., h.b.c., fast and reliable, £16, or exchange modern 3½h.p., F.E., cash adjustment.—D. Jones, Pontybat, Brecon.

1909 Tourist Trophy Triumph, engine and magneto recently overhauled by makers, new tyres and belt, Cowey speedometer, lamp, machine in fine condition; £34.—Purnell, Cambrian Brewery, Newport.

CHATER-LEA-PEUGEOT, 3½-4h.p., late 1911, Saxon forks, Bosch h.b.c. magneto, All saddle, Palmer cords, footboards, spare valves, tube, plug, tools; genuine bargain, £28.—Burgess, Sidbury, Worcester.

1911 Calthorpe, 3½h.p., £32/10; 1910 standard Triumph, £34; 1910 clutch Triumph, £38; 1910 Kerry-Abingdon, £25; 1908 Minerva, £12; 1907 Minerva, magneto, £10.—Collier, 52, Somerset St., Abertillery.

BIRMINGHAM SHOWROOMS: 78, New Street.

Stocked by all the leading factors.

MOTOR BICYCLES FOR SALE.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts, and Hants, and Channel Islands.

TRIUMPH, free engine and standard models; delivery from stock.—Laytons', Bicester.

RUDGE-WHITWORTH, multi-speed model; delivery 7 days.—Laytons', Bicester.

B.S.A. Motor Bicycles, free engine models, from stock.—Laytons', Bicester.

JAMES, 3½h.p., 1912 standard model, the big engine with a big heart; delivery from stock.—Laytons, Bicester.

PREMIER, 2¼h.p. lightweight, 1912, new 3 weeks ago, and as new now; cost £36; your offers wanted.—Laytons', Bicester.

ENFIELD, 2¾h.p., 2-cyl., 2-speed model; delivery from stock; £46.—Laytons', Bicester.

EXCHANGES Considered concerning any machine.—Laytons', Bicester, Oxon.

1912 Lincoln Elk, 3h.p., new March; bargain, £22.—White, 42, London Rd., Camberley.

1910 Moto-Reve, twin, 2¾h.p., just overhauled, in perfect condition; £20.—White, Camberley.

1911 Kerry-Abingdon 3½h.p. Motor Cycle, new Feb. 1912, splendid condition.—White, Camberley.

MOTOR Cycle, Fafnir engine, B. and B. carburetter in good running order and condition; bargain, £10.—White, Camberley.

TRIUMPH, 1910, free engine, new tyres and belt, in splendid condition; £35, lowest.—White, Camberley.

MINERVA, 3½h.p., 1909 cylinder; £10/10, or near offer.—19, Canute Rd., Southampton.

1912 Triumphs, free engine, in stock; immediate delivery; £55.—Paxman, Tewkesbury.

3½h.p. Rex, overhauled, splendid running order; sacrifice £8.—8, Blucher St., Chesham, Bucks.

1912 2¾h.p. 3-speed New Hudson, brand new; accept 43 guineas.—Bennett, West St., Fareham.

ARIEL, new, under 300, demonstration; illness, must sell, any reasonable offer.—Burton, Vicarage, Banbury.

TRIUMPH Motor Cycle; price £20; new cylinder and piston, magneto; owner abroad. — Readhead, Salisbury.

CHAIN Drive 2-speed Bradbury; delivery from stock; first cheque £58/10 secures.—Gough's Motors, Gloucester.

1911 Rudge, June, not done 900 miles, as new; demonstration machine; £36.—Balfour's Motor Works, Banbury.

2¼h.p. F.N., 2-speed, free engine, splendid condition, climb anything; £22.—Baker, 200, Holdenhurst Rd., Bournemouth.

4h.p. Martin, Xl'all saddle, magneto, needs slight repairs; bargain, £12/10; exchange.—King, Shipton Bellinger, Andover.

FOR Sale, Hobart, recently re-bushed, excellent condition; £8.—Particulars, Collyer, wheelwright, Gt. Horwood, Winslow.

ZENITH, 1912, 6h.p., exceptionally equipped; cost nearly £80, condition perfect; £55.—Heyboum Motors, Maidenhead.

ZENITH, 1912, 3½h.p., run 200 miles only, perfect condition; £50, no offers.—Lake, Southcourt, Chalfont Common, Bucks.

B.S.A., 1912, 2-speed, 2¼ tyres, perfect, run 400 miles, cost £61/3, accept £56, or nearest offer.—Rutcliff, Kilminster, Stroud.

6h.p. Curette, perfect, wheel control, 2 speeds, B. and B., new tyres; £20; exchange.—40, Leaphill Rd., Pokesdown, Bournemouth.

ENFIELD, 2¾h.p., late 1910, perfect condition; owner buying car; accept any reasonable offer.—Sunn, Bank, Burcott, Aylesbury.

2¾h.p. De Dion, accumulator, and cash; wanted, light weight magneto motor cycle.—Rowles, Golden hayes, Bartley, Southampton.

TRIUMPH, 1909, splendid condition generally, engine overhauled and guaranteed perfect; £28.—Gough's, Motors, Gloucester.

TRIUMPH, F.E., 1911, only ridden 1,000 miles, excellent condition; bargain, £50.—Dominy and Co., Triumph agent, Winchester.

TRIUMPH, 1910, standard, enamel and plate as new, guaranteed in perfect order; £39/10.—Dominy and Co., Triumph agent, Winchester.

3½h.p. Quadrant, accumulator ignition, h.b.c., B. and B. carburetter, good order; photo sent; £10.—Pearce, Ower, Romsey, Hants.

RUDGE and Bradbury Models, for prompt delivery; trial runs; exchanges entertained; send for lists.—Agent, Barnes, Colnbrook, Bucks.

1911 Triumph, free engine, 2-speed gear, lamp, horn, etc., sidecar if desired; a bargain, must be sold.—Jacob, 6, Noel Cottages, Bletchley.

TRIUMPH, free engine model, new July, 1911, in fine condition, lamp, horn, spare tube; £42/10.—Paterson, 31, Leigh Rd., Eastleigh, Hants.

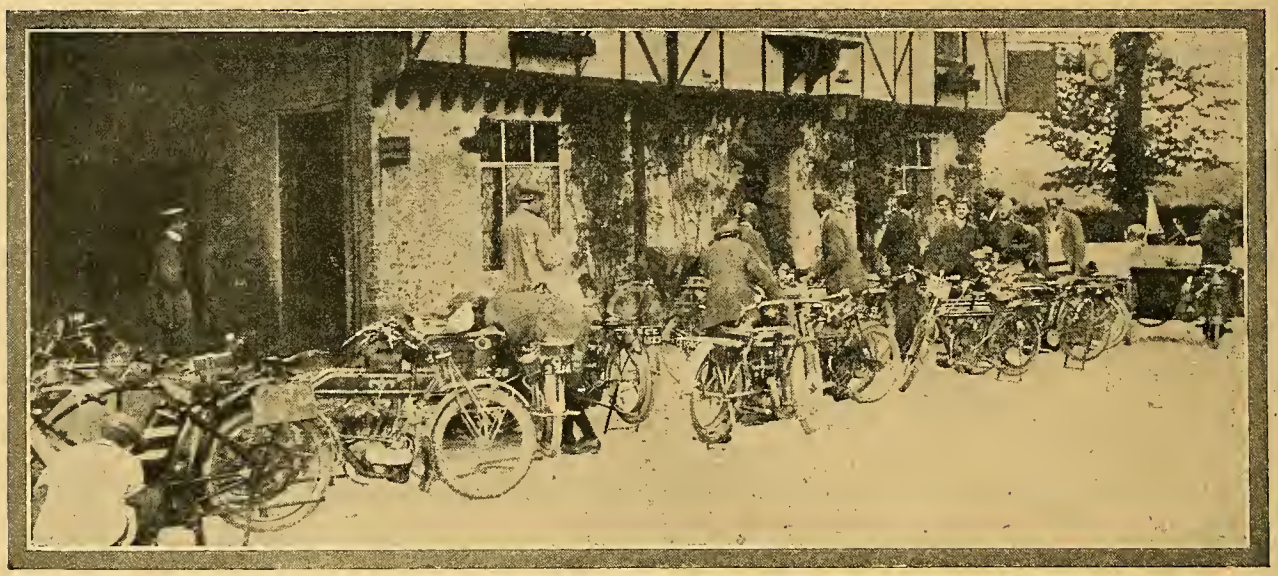
A Glut of Open Hill-climbs.

RECENT events have conclusively proved that open hill-climbing competitions have been overdone. Interest in these events must wane when the same coterie of riders fight out a weekly battle, one week in the North of England, the next in the South, and practically always with the same result. We know that the trade, speaking generally, are almost afraid to send their representatives to some of these competitions, where in many instances the hill is a badly chosen one with dangerous bends which cause competitors, who have got to win at all costs, to take undue personal risks.

Now that the speed of motor cycles has increased so largely, there are very few hills which are really suitable and safe for these contests, and it is time the Auto Cycle Union stepped in and refused to allow more than, say, six open hill-climbs during the year, the hills to be chosen by the competitions' executive.

We do not wish to see sporting events discontinued by any means, but if hill-climbs are to continue they should be confined more to club members, and some improved methods of finding the winners should be instituted. The absurdity of the modern hill-climb is shown by two snap-shots in last week's issue, where riders are depicted in the act of falling while trying to negotiate bad corners too fast. Among the ideas that suggest themselves for improving hill-climbs are a combined climb and non-stop run of twenty miles or so at legal limit, so that the hill is climbed with hot engines, and ascending a gradient several times non-stop. Unless some measures be taken to reduce the number of open climbs and to confine them more to club members, the fact of their super-abundance and the constant winning of the same riders must eventually rob this valuable form of contest of all interest.



Already we know of one or two important firms who have decided to refrain from future hill-climbs run on the same lines as those referred to in the first portion of this article. There is also the recent decision of the Manufacturers' Union not to support open hill-climbs unless they receive the assurance of the organisers that proper precautions have been taken to safeguard the competitors from accident.

Power for Sidecar Work.

TWO contributors to our correspondence pages this week take directly opposite views of the question of the power required for sidecar work. One thinks the standard 3½ h.p. engine quite sufficient, and instances several performances accomplished therewith; the other, who has had experience of many different machines, tells readers that he does not think any engine less than a twin-cylinder of about 8 h.p. is any use. Time was when the standard single-cylinder was not powerful enough, but the perfecting of change-speed gears has altered the question from one of power to speed. Provided the gear ratios are sufficiently low, the single-cylinder engine will take a sidecar up practically any hill, but only at speeds which to some are irksome. It amounts to this: the single-cylinder requires a bottom gear ratio of about 10 to 1 to render the climbing of steep hills a certainty, and the top ratio should not exceed about 5 to 1. The more powerful twin will do the same work on higher gear ratios with a corresponding increase of speed. Individual choice, therefore, should decide this question.

INTER-'VARSITY HILL-CLIMB.

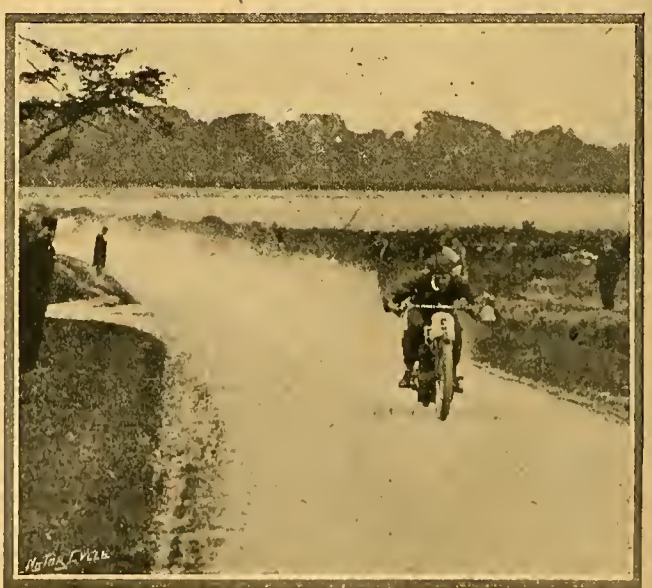
SIXTY COMPETITORS IN A SPORTING EVENT. OXFORD EASY WINNERS.

AT THE RENDEZVOUS—THE LAMBERT ARMS, ASTON ROWANT.

A MOST sporting hill-climb, which took place on Tuesday afternoon, the 21st inst., was the inter-club event held between the two University motor cycle clubs. The competition was quite well organised when it is taken into consideration that neither the Oxford nor the Cambridge club have had much experience in work of this kind. The hill was well flagged, no one made an ascent before the competition began, and the rules were framed so as to render riding as safe as possible. The hill utilised was Kingston Blount Hill, running parallel with Aston Rowant, which was that chosen by the Motor Cycling Club for their members' hill-climb on the 11th inst. The results were decided on the number of points gained. The first place represented five points, the second three points, and the third one point. Class I. was for lightweights up to 350 c.c., to be decided on formula :

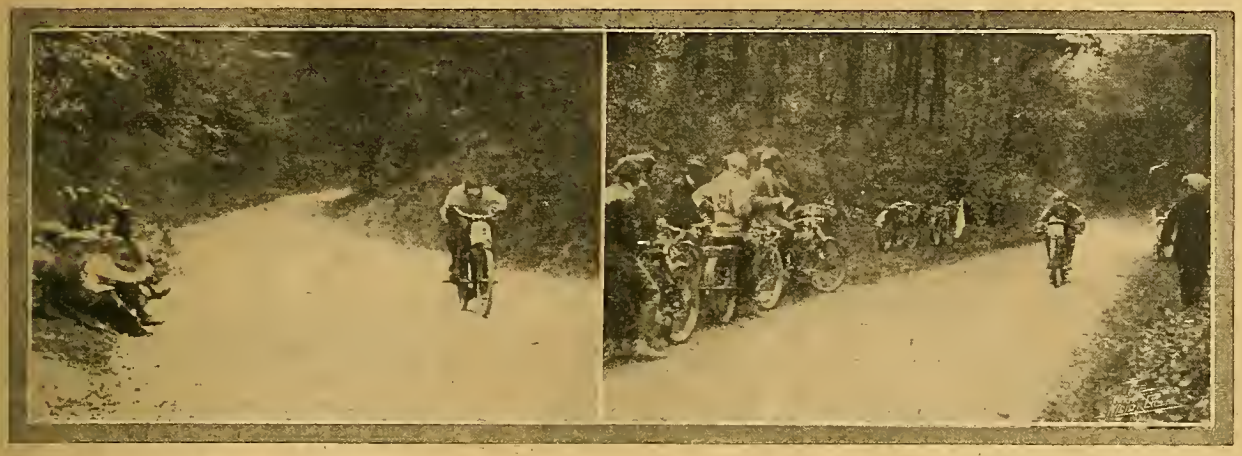
	University.	mm.	c.c.	Time. m. s.
1. O. B. Pratt (2½ Premier),	Oxford	66×72	245	1 32
2. A. F. R. Broadhurst (2¾ Douglas) ...	Oxford	60×60	340	1 39⅖

G. McBain (2¾ h.p. J.A.P.), the only Cambridge representative, dismounted near the summit, consequently the formula was not worked out.



A Second Win for Oxford.

Class II., for single-cylinder touring machines, to be decided on formula, consisted of seven Oxford and seven Cambridge men. Only three Cantabs, however, started. Here again the Oxonians scored heavily, winning on both time and formula :



Formula place.					
1.	O. B. Pratt (2½ Premier),	Oxford	65×72	246	1 34⅕
2.	J. P. MacDonald (3½ Norton),	Oxford	82×94	496	50⅕
3.	J. Reid (3½ Triumph),	Cambridge	85×88	499	1 -3¼

In this class D. G. Murray (3½ h.p. Triumph) assumed a most curious position, keeping his right leg in a sort of kneeling posture.

Class III., for multi-cylinder machines up to 1,000 c.c., decided on formula. Five Oxford men and eight Cambridge men started. Cambridge scored on this occasion, while the most conspicuous feature of the class was the number of 7 h.p. Indians entered. Sandeman (7 h.p. Indian) (Cambridge) wobbled dangerously during his ascent, but he managed to make good time. E. H. Lees, who is a well-known

L. P. Openshaw (8 h.p. Zenith) making a fast ascent.

O. B. Pratt (2½ h.p. Premier), who obtained two firsts on time and two on formula.

G. W. Phillips (6 h.p. Blumfield) finishing. He was the fastest rider in Class 3.

rider outside the C.U.M.C.C., did not ride in this class, as he damaged his hand in the Leathley Bank hill-climb. I. C. Maxwell rode in his place :

Formula. place.		Mm.	c.c.	Time. secs.
1.	G. W. Phillips (6 Blumfield), Cambridge	67 ×95 (2)	670	51⅕
2.	L. P. Openshaw (8 Zenith), Oxford	85 ×85 (2)	964	45⅖
3.	I. C. Maxwell (7 Indian), Cambridge	82.5×93 (2)	994	52

Phillips's Blumfield certainly travelled splendidly, while Openshaw, on his Zenith, made the fastest time of the day.

Class IV., for T.T. singles up to 500 c.c., decided on time :

1.	W. G. McMinnies (3½ Triumph), Oxford	85×88	499	52⅕
2.	O. E. Stout (3½ Rudge), Cambridge	85×88	499	54⅘
3.	A. C. Hardy (3½ Norton), Oxford	82×94	496	55⅕

Class V., for passenger machines up to 1,000 c.c., decided on formula. Only two Oxford men and no Cambridge man finished, so the formula was not worked out :

1.	L. P. Openshaw (8 Zenith sc.), Oxford	85×85 (2)	964	1 10
2.	G. V. Sinclair Smith (6 Enfield sc.), Oxford ...	76×85 (2)	770	1 28⅘

A. H. Dalton (8 h.p. Matchless and sc.) failed, while N. B. Stewart (3½ h.p. Arno and sc.) met with a similar fate.

Fast Speeds.

Class VI., for all-comers, decided on time :

1.	L. P. Openshaw (8 Zenith), Oxford	45
2.	B. Sandeman (7 Indian), Cambridge	49⅕
3.	I. C. McLure (7 Indian), Cambridge	49⅗

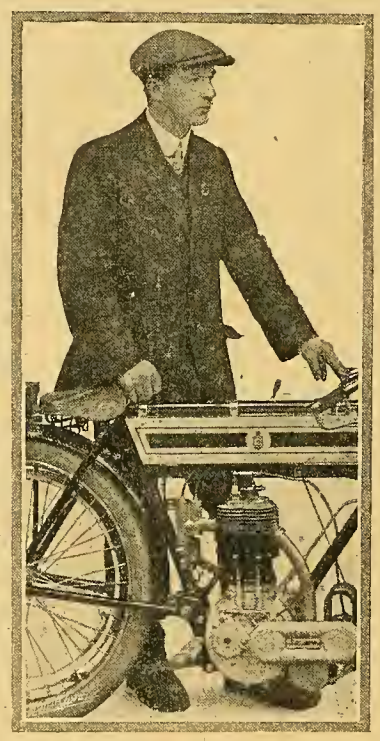
Kingston Blount Hill is not much obstructed by traffic, but first two cows and then a cart caused some delay in this class being run off. I. C. McLure had a traffic stop, and so was allowed a second attempt. Sandeman had apparently learned the hill during his first ride up, as he made a much better performance on this occasion. Mr. A. C. Hardy (New College, Oxford) worked out the times, and at the Lambert Arms, Aston Rowant, where tea was served, announced that Oxford had won—38 points to 15. Mr. Hardy was joint hon. secretary with Mr. T. M. G. Chapman (Trinity College, Cambridge). The judges were Messrs. W. R. McBain and J. J. Conybeare, and the timekeepers Messrs. F. T. Bidlake and A. V. Ebblewhite.

The winner of the silver cup presented by Mr. F. H. A. Marshall for the fastest time made by a Cambridge man was won by B. Sandeman (7 h.p. Indian). The cover presented by Messrs. Wood-Milne, Ltd., for the fastest time of the day was won by L. P. Openshaw (8 h.p. Zenith) (Oxford). The belt presented by Messrs. Lycett, Ltd., for the fastest time in the T.T. class was won by W. G. McMinnies (Oxford).

Colours of the Rivals.

Oxford and Cambridge colours were freely displayed on the machines, on sweaters, and in several cases by elaborate garters artistically placed round the left knee.

Robert, as the policeman on duty on the hill was affectionately called, did excellent work at the cross roads by the Lambert Arms, and was enthusiastically called forth to take his place in the photograph taken after the hill-climb. He modestly refused, but eventually was persuaded to take his place in someone's sidecar, and thus to be handed down to posterity as one who did his duty, and who did it in the sportsmanlike manner usually displayed by that most excellent branch of the Force, the Oxfordshire Constabulary. The fact that every competitor was an amateur in the truest sense of the word rendered the event all the more interesting, and quite a refreshing change from the usual run of motor cycle events.



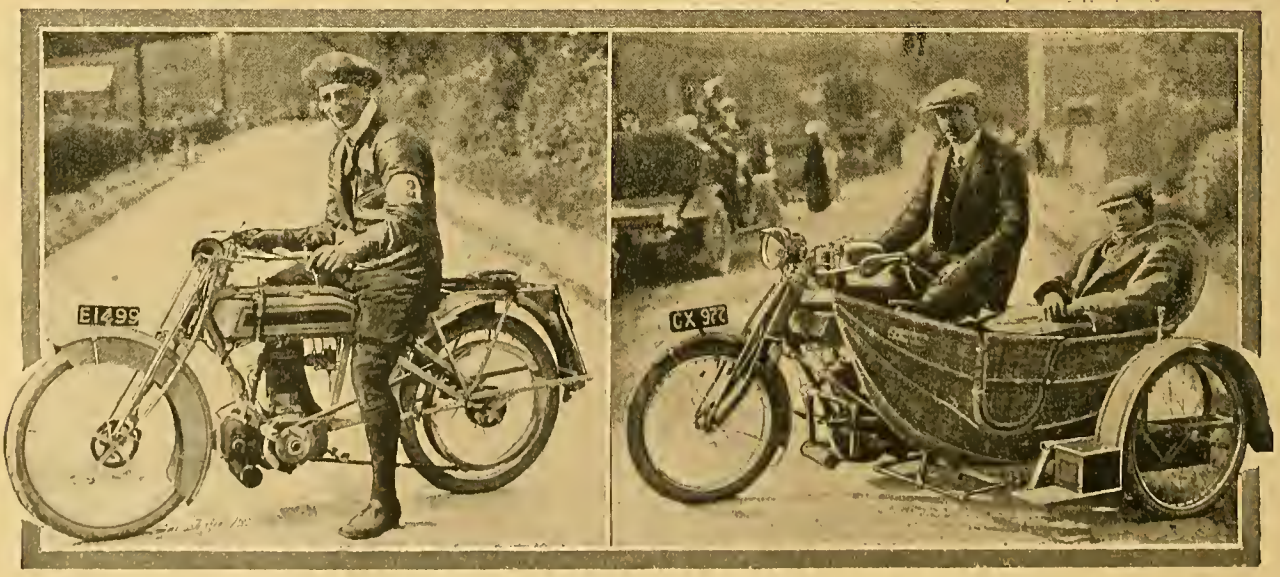
BRITISH MOTOR CYCLES IN CANADA.

We are advised that two firms handling British motor cycles in Toronto have relinquished them in favour of American mounts. American makers are doing their utmost to educate Canadian riders to believe that the U.S. models are *the standard* to judge by, therefore deviations from such standards appear odd to some Canadians. British makers of motor cycles should not lose sight of the big effort that is being made by our American cousins to capture the Canadian motor cycle business. The agents for two makes of American motor cycles have, it is said, received large orders for delivery this year.

MY MOST EXCITING RIDE:

No. 2.—W. F. NEWSOME.

"MY most exciting ride?" queried W. F. Newsome, the famous Triumph rider. "I find it somewhat hard to answer that question, for most competitive rides are more or less exciting. At any rate, most of the races I have contested have had some exciting incident or other connected with them. I think the Tourist Trophy races have impressed me the most though, and of the series the race of 1909 stands out very prominently. I had excitement on two scores in that race, for I narrowly missed an accident, and at the same time was going so well that I was near the top all the time. It became necessary for me to stop in the sixth round in order to make an adjustment, and as I feverishly opened my toolbag the usual little crowd of spectators came up, and I enquired of them as to where I stood in the race. One of them told me I was lying fifth, and in my hurry to pick up the tools I dropped them all over the road. With one's nerves all on end and the knowledge that every second counts, fingers become thumbs, and my average speed suffered through my haste. But I got the tools together again, and went off for all I was worth, knowing that I still held a sporting chance.



W. F. Newsome, who finished third in the 1909 T.T. race and first of the single cylinders.

Cornering in the T.T.

"In one of the subsequent rounds I happened to come abreast another competitor just before reaching the bend at the bottom of Creg Willey's Hill. I was overhauling my man, but there was not much between our speeds, and we took the corner neck and neck. It was quite impossible for both of us to get round together, it being quite a difficult job for one to take the bend while going all out as we were. My heart was in my mouth, but, to my intense relief, the other man switched off, and this just enabled me to get round first. Never before did I feel so excited, and my nerves were pent up right through until the finish, where I pulled up very stiff. I had not worn goggles, and my eyes were full of dust and terribly sore, but they told me I had finished third in the race and first among the single-cylinders, as a result of which knowledge I quickly got into trim. It was a race in which every moment was exciting, and in which the incident at Creg Willey's corner stood out as the main feature of the ride."

A Modest Rider.

Newsome is one of the best-known trade riders of the day, and since the retirement of Jack Marshall, who won the Tourist Trophy race in 1908, he has been chief rider for the Triumph Company. His exploits on hills and in trials rank among the greatest of motor cycling feats, and he is a rider whose exceptional success has not turned his head. Unfortunately he will be an absentee in this year's T.T. race.

A new pattern 3½ h.p. A.S.L. made its initial appearance at Leathley Bank. It will be noticed that this machine has 26in. wheels, new pattern spring forks, and is finished in French grey. The rider is W. E. Cook.

J. Lockwood, hon. sec. of the Huddersfield M.C.C., with his 5-6 h.p. Clyne and Gondola sidecar. This novel sidecar was referred to in our issue of May 2nd last.

Occasional Comments by "Ixion"

Steady Speedometer Needles.

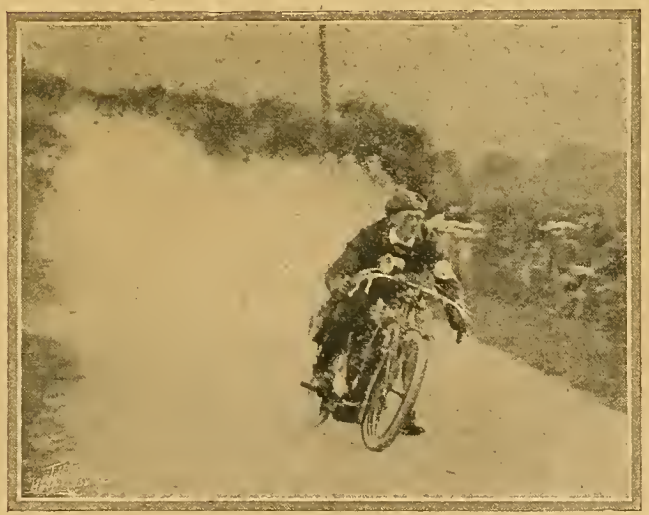
Unfortunately the market is not so crowded with speedometers that we can press for an A.C.U. trial of these invaluable devices; but the potential buyer will do well to make sure that he selects a make which does not suffer from a wobbly needle. Last week I tested three different types. On one the needle swung freely over a fifteen or twenty mile range of its dial, quite irrespective of road vibration or of front fork action. On another the needle was comparatively staid and sober up to 30 m.p.h., but commenced to "hunt" at those higher speeds at which accurate readings were essential to prove the value of certain tunings I was experimenting with.

The third device is not, I believe, made in motor cycle sizes, but had been converted by a car owner. This device owned a large blunt needle, which fairly clung to the correct figure, and pushed itself almost imperceptibly around the dial, without a trace of dithering.

I have no doubt that the quality of the road surface and the action of the front forks have their effects on certain speedometers, but now that I know from actual experience that it is possible to turn out a speedometer with an absolutely steady needle, which is not affected by any vibration, I shall not be satisfied until I have got one.

Petrol Consumption.

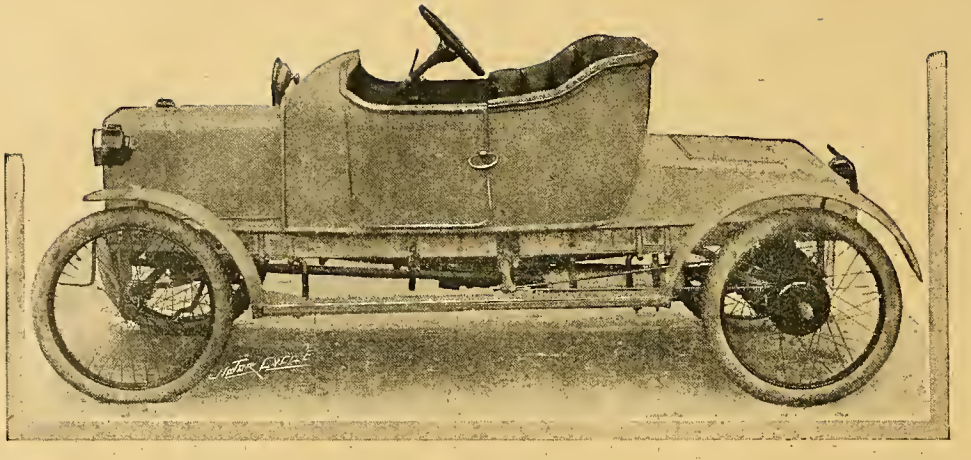
In the discussion about excessive petrol consumption and automatic carburetters, correspondents and contributors appear to have ignored the fact that the average motor cycle manufacturer instructs his testers to adjust the carburetter to provide a mixture that is "rich all through." I have never yet taken delivery of a machine which was adjusted to provide sufficient air for the throttle's widest opening. The reason is obvious. If the jet be a size or so too large for absolute efficiency, the engine will start easily and the mixture will be less sensitive on hills and in picking up after a slow. These theoretical deficiencies are practical merits, since the bulk of motor cyclists are not expert mixture manipulators, and the buyer who knows a little can be trusted to remedy the adjustment for himself.



My latest 3½ h.p. as delivered only did sixty miles per gallon, and took full air on half-throttle. So there is room for semi-automatic or fully automatic carburetters to err on the rich side without being inferior to the standard two-lever type as adjusted by the makers; and here is a partial explanation of the universal waste of fuel.

The addition of a Krebs type of automatic valve to existing two-lever vaporisers would retain the easy starting and the non-sensitive air lever without so gross a sacrifice of efficiency. But most buyers would need the help of carefully worded instructions for the adjustment of the valve spring when its tension began to vary in wear.

Improving Mackintosh Leggings.

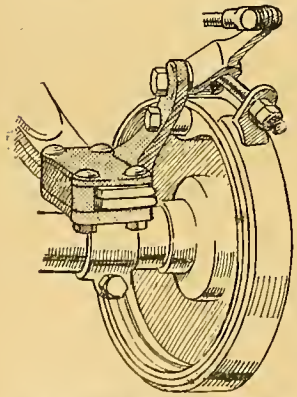


Many mackintosh leggings have grave weaknesses. The first is the flimsy nature of the seams at the fork. If the legging be cut by ordinary tailors, who have no idea of the strain thrown on these seams by the jump mount, they make the legging far too tight a fit, with the result that the material soon rips when the rider leaps off the ground and does "splits" as he vaults into the saddle. If a dealer's stock does not contain a pair that are a loose fit at this point, there are three alternatives: (1) To buy too large a size; (2) to strengthen the correct size by solutioning canvas strengthening strips over the fork seams; (3) to buy a pair of separate pullovers in lieu of trousers. The defect of separate pullovers is that they give no protection from a wet saddle; this may be nullified by laying a waterproof case in which the overalls are carried, over the saddle when the overalls are being worn and the saddle is exposed to rain during a dismount.

Another drawback is the weakness of the instep straps. These are generally made of the same mackintosh material as the leggings; their proportions are more suited to a dancing pump than to a serviceable boot, and unless the leggings are a shade too long to be a pretty fit, mounting and dismounting throw a big strain on the straps. Straps made of mackintosh material soon wear through if the rider place the middle of his foot on the footrests. The straps ought always to be of leather, and made adjustable by means of a buckle. Astute riders never don a new pair of leggings until they have got a saddler or cobbler to substitute really serviceable straps of this type.

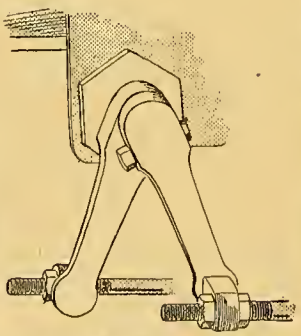
A PROLIFIC PRIZE WINNER.

F. W. Barnes (8 h.p. Zenith-Gradua) making fastest time in the Bradford M.C.C. Open Climb at Leathley Bank. Barnes, as usual, had several first awards to his credit at this event.



THE ARDEN CYCLECAR.

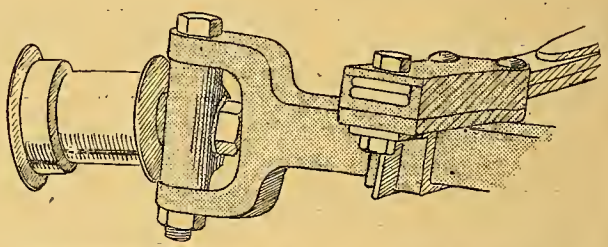
AN ENTIRELY NEW FOUR-WHEELER WITH SHAFT DRIVE.



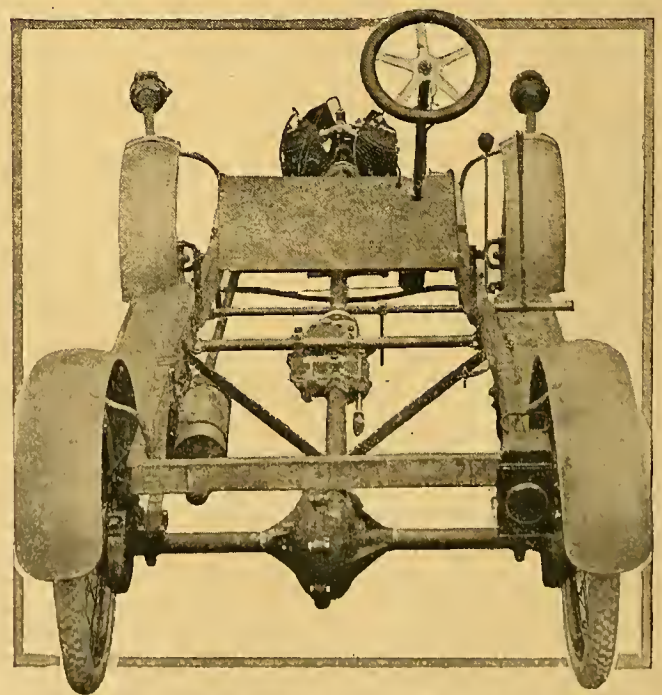
LAST week we inspected the first model produced of a new pattern cyclecar which is being placed on the market by the Arden Motor Co. of Berkswell, Warwickshire. It is the first of a batch of twenty-five, and it will be agreed on inspection of the illustrations that it is of smart design. A motor car in miniature best describes the vehicle, accepted car practice being closely followed throughout. Power is derived from an 8 h.p. J.A.P. air-cooled engine placed transversely in front, cooling being assisted by a belt-driven fan. The carburetter is an Amac, the control being attached to the steering wheel. The drive is by propeller-shaft through a three-speed gear box of the sliding tooth type, giving ratios of 5, 8½, and 12 to 1, and a reverse of 15 to 1, to a differential and live axle of substantial proportions. The wheelbase is 7ft., whilst the track measures 3ft. 8in.

The Margin of Safety.

In examining this vehicle we were impressed by the fact that, although light weight was the outstanding factor, no part having an important function to perform had been reduced in dimensions. For instance,



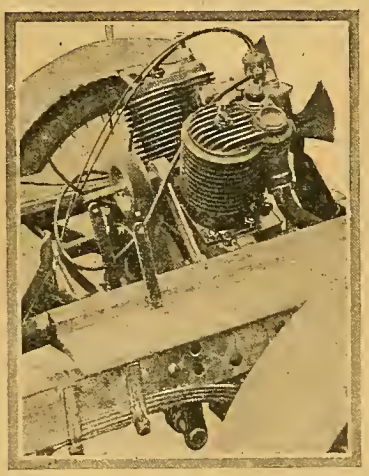
Rear spring slide and brake gear of Arden cyclecar, showing internal and external brake shoes.



Brake operating levers showing method of adjustment and sturdy construction.

the brake connections and fittings, also the bobbin and wire steering gear, appeared to be amply strong for their purpose. Provision for taking up slackness in the cable has not been overlooked, and as eyeleted ends have been done away with it is considered that the steering gear will outlast the car. The braking power is obtained from internal expanding brakes on the rear wheel operated by a pedal, a side lever contracting external bands on the same wheels. The gear

Front springing. Notice how the steering head is canted out at the bottom.

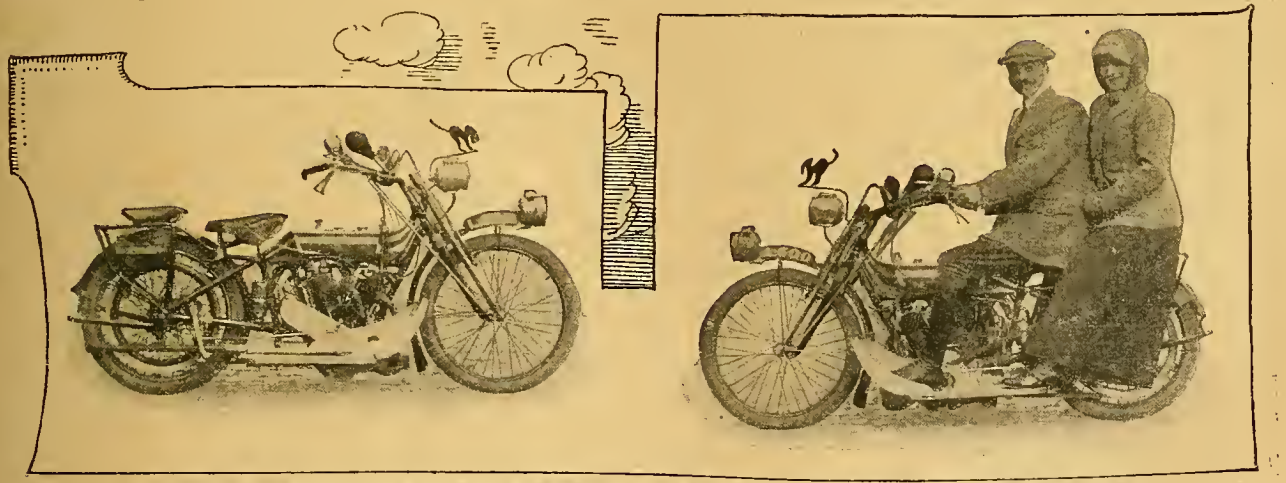


box, which is placed amidships, and which is readily accessible by removing the footboard, is controlled by a change speed lever inside the body. It is sup-

Rear view of chassis showing live axle, torque rods, and general disposition of parts.

The Arden Cyclecar.—

ported by a tubular cross member at the back and by a large diameter tube from the front, which latter also encloses the forward propeller-shaft and is carried at its front end by a substantial bracket immediately behind the clutch. A refinement which we believe is new to cyclecar design is that both engine and gear box are set on a slight slope so as to reduce the angularity of the rear propeller - shaft. The springing of the car is particularly neat, and should prove most efficient in practice. Laminated springs project from each corner of the oak frame, the bottom leaves extending the whole length of the side frames. The frame is supported by flitch plates, the engine cradle forming an additional girder. The clutch is of the internal leather to metal type, the periphery being thickened in order to act as an auxiliary flywheel to enable extremely slow running. An important feature is noticeable in the arrangement of the steering heads, in that the stub axles are so supported that a line produced downwards through the pivot centres would meet the ground at the central point of tyre contact; this is correct practice and considerably improves the steering. A handsome two-seated flush-sided body with scuttle dash is fitted, and this cyclecar is to be sold complete with lamps and horn at a price which will be in the neighbourhood of £100. Running boards, curved mudguards, and covered-in working parts enhance its appearance. The tyre equipment is 26 × 2½in. Hutchinsons on wire wheels. With body complete, we were informed that this vehicle weighs approximately 6 cwts., so that it is well within the A.C.U. definition of a cyclecar.



The power unit—an 8 h.p. J.A.P. engine—showing fan placed in front of cylinders, theoretically the correct position.

Mr. E. A. Isherwood, the proprietor of the Arden Motor Co. (formerly the Swan Motor Co.), is a motor cyclist of long standing, and his experience of good machines will ensure that everything, even down to details, of the Arden cyclecar is perfectly satisfactory and up to its work before being finally offered to the public.

A Powerful Twin of Original Design.

WE are able to give details of a very interesting mount made to the specification of M. Louis Augustin, 23, St. Bernard's Crescent, Edinburgh. The machine was made for him by Mr. Saunders, of Bristol, and is fitted with a 7-9 h.p. Peugeot automatic valve engine, having a bore and stroke of 80 × 98 mm. respectively. The frame and fittings are Chater-Lea throughout. Bosch magneto and B. and B. carburetter are used, and the engine is fitted with two large silencers and a long pipe extending to the back of the rear wheel and flattened at the end. Transmission is by Clyno adjustable pulley and 1in. belt to the rear wheel, in which is incorporated an Albion plate clutch, a handle starter being fixed to the frame on the offside of the machine. The wheels are shod with 26in. × 2½in. tyres. Two very noticeable features are the long footboards with metal mud shields and the tank, which is duplex and is slipped over the top tube and then connected up at the bottom. The right hand tank is fitted with the J.A.P. automatic lubricating device, and the space between the tanks forms a neat protection for generator tubes and wiring.

Left and right side views of the 7-9 h.p. special twin described. The owner is astride the machine in the right-hand illustration.

A second saddle will be noticed on the carrier; this is frequently used for passenger work and is found quite satisfactory. The weight of the machine ready for the road is 224 lbs., and the machine starts up any ordinary gradient on a 3½ to 1 gear. It is worthy of observation that tie rods are used from the forks to the handle-bars.

PETROL CONSUMPTION.

CONVINCING PROOFS THAT MOTOR CYCLES ARE NOT EXTRAVAGANT,

A LETTER signed "Enquirer" which appeared in the issue of the 9th inst. under the heading of "Petrol Consumption" has brought quite a flood of replies. The letter pointed out that we had stated several times that the popular 3½ h.p. motor cycle should run about one hundred miles to the gallon. The writer said his average consumption was sixty miles to the gallon, and he wished to know if the consumption he named was really abnormally high, or if the figures we and the makers gave were only paper ones. We left our readers to take up the cudgels. The replies received are so numerous that we have made a selection of extracts for publication which cannot fail to allay any anxiety "Enquirer" and others may have felt regarding abnormal consumption. The letters distinctly show that 100 m.p.g. is not uncommon for a 3½ h.p. machine, and is very often exceeded under ordinary touring conditions. Under exceptional circumstances a 3 h.p. machine has done 22 miles at the rate of 220 m.p.g.

Sir,—Replying to "Enquirer," he must certainly be riding a very extravagant bicycle. Mine, a Douglas, runs regularly 270 miles to two gallons. Something the matter with bis engine. THOS. ABLE.

Sir,—My present mount is a 3½ h.p. 1912 two-speed Humber, which invariably exceeds 100 miles per gallon. At first it would not do more than eighty to ninety miles per gallon, but by using a smaller jet and getting to know the best lever positions, I can average from 100 to 110 m.p.g. The size of the jet is something between .028 and .032. SHAZBAZZIK.

Sir,—My machine is a 3½ h.p. B.S.A. with B.S.A. two-speed gear, which I have had about six weeks. On my first run of sixty-two miles it required half a gallon to restore petrol to its original level in the tank. I was fully equipped for the week-end, with luggage on the carrier. The average speed was about 20 m.p.h. On a more recent occasion the machine used one gallon for 98½ miles. The jet used on the latter run was a .030 and on the former .032. This is the first and only machine I have ever owned or ridden, and I am very pleased with it. J. C. S. DAVIES.

Sir,—I was led to believe that one gallon of petrol would run about 100 miles. I have kept a careful account of all petrol used for the miles run, and find that thirteen gallons has just taken me 1,000 miles, which works out to about 77 m.p.g. Being a novice, and only having ridden a 1912 3½ h.p. three-speed machine about five weeks, I thought perhaps after a while I might run on a little less quantity, as I shall change speed less often and stop less frequently, both of which I suppose consume the petrol. Still, I doubt whether the experience will give me the other 23 m.p.g. NOVICE.

Sir,—Riding daily on business, and with no special attachments of any kind, my consumption works out at 88 m.p.g. I always give all air the engine will take, and my speed is never above the legal limit. My machine is a 1909 3½ h.p. Triumph, which has covered, before and since I got it, over 6,000 miles. It is fitted with the Triumph carburetter, and a jet No. 32, slightly hammered up. My last test was for 800 miles by cyclometer, and consumption was just nine gallons. M.P.G.

Sir,—I purchased a gallon of petrol on a recent Friday night, and did sixty miles solo on the Saturday and forty miles on the Sunday with a sidecar, and still had a wee drop at the bottom of the tank—in fact, about as much as I had in when the gallon was put in. This was done on a 3½ h.p. Bradbury without any special regard for economy. On my last year's machine—a Triumph—I rarely failed to do at least 100 miles per gallon, and often 110. I used a .028 jet, which I found caused an appreciable saving as compared with a standard .032 jet, although I am strongly of opinion that careful use of the control levers and a clean and healthy engine accounts for more economy than all the tinkering with a standard carburetter that the average man can do. The makers of nearly all machines advise giving as much air as the engine will take without misfiring. This is wise up to a certain point, but frequently means a weak mixture. A little less opening of both air and throttle levers will often give the same road speed. OLD 'UN.

Sir,—Quite recently I rode 169 miles, averaging just under 25 m.p.h. for running time, on exactly 1¼ gallons. Under adverse conditions, naturally the consumption is increased, but seldom falls below 95 m.p.g. L.V.B.

Sir,—I possess an ancient 2¾ h.p. chain-driven Humber about seven years old weighing about 200 lbs. all on. I weigh about twelve stones good. This machine will always run eighty-seven miles to the gallon, and has done 120 on level roads in the East Riding of Yorkshire, the average being about ninety-eight. I have an old Longuemare carburetter. CROCK.

Sir,—On my 1912 Rudge I have always exceeded 90 m.p.g., no matter what the conditions of the ride have been, and on two occasions I have covered 125 miles on a tankful of 1¼ gallons. It therefore seems to me that "Enquirer" is either careless in his driving or that he possesses a badly tuned machine. MYER B. LEE.

Sir,—I ride a 1912 6 h.p. twin-cylinder Matchless with V.S. two-speed gear. I took delivery on the night of April 13th, and have since ridden 1,118 miles—1,006 solo and 112 with a sidecar, with my wife and boy, who weigh 15 stones; my weight is 14 stones. This gives a mileage of 74½ to the gallon, as I have used fifteen gallons. The machine is fitted with a J.A.P. carburetter, single lever. I use my machine for business purposes, and my riding has been done in W. Yorks., Cumberland, Westmorland, and Northumberland. VAL TAYELOR.

Sir,—Sixty miles to the gallon is a very poor average. I ride a J.A.P. which is fitted with a Chater forecar attachment (minus seat), and have no difficulty in averaging 90 m.p.g. on average roads. The carburetter is a home-made article with adjustable jet, and I have no doubt could be adjusted to yield 100 m.p.g. IM 17.

Sir,—My 3½ h.p. 1910 Rex has on several occasions covered one hundred miles to the gallon. On one occasion I rode 138 miles on 1⅛ gallons, with an all-night stop at Oxford. The carburetter is a B. and B. with an ordinary touring jet. My brother, on a 5 h.p. Peugeot-Chater-Lea, B. and B. carburetter, rode 128 miles on one gallon. MALCOLM J. ROUND.

Sir,—I have always been able to average a good eighty to the gallon without any special tuning whatsoever, and with a 4 h.p. twin last season averaged seventy-five miles per gallon. My present mount, a 4 h.p. Rex with B. and B. Universal carburetter, averages 90 to 95 m.p.g.

Petrol consumption is governed largely by the following factors: Speed, gear ratio (this makes a big difference in consumption), size of jet used, good compression, and waste of petrol—particularly blowing back through air ports. This latter waste can be largely overcome by fitting an extension pipe with gauze over extra air.

With the B. and B. Universal, of course, it is possible to run with a much smaller jet opening on the level than with the single jet type of carburetter, as one can enlarge the adjustable jet to any size on approaching a hill. Personally I always use the smallest jet engine will take. Petrol level also accounts for a lot of waste if too high. C.E.T.

THE MILITARY MOTOR CYCLIST.

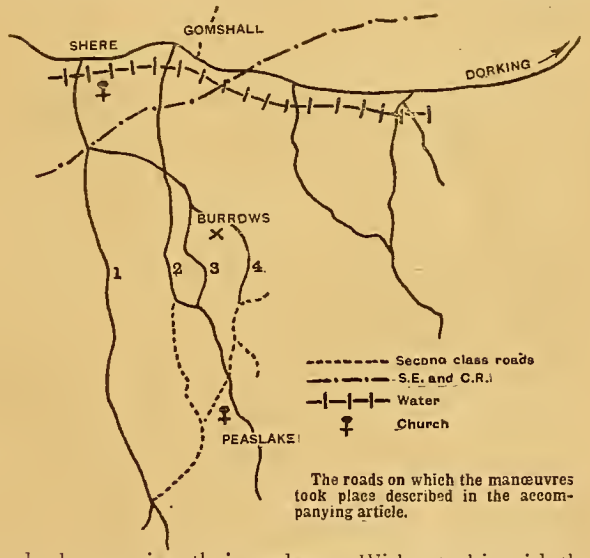
NIGHT MANOEUVRING IN SURREY.

PROBABLY the first manœuvres this year in which a motor cyclist took part were held a few weeks ago near Shere, Surrey.

The actual seat of the operations was kept a close secret until the actual day, and hence no opportunity was given to anyone to make himself familiar with the country. It was a Saturday morning, and it had been raining steadily for two hours when I set out from Sevenoaks. The condition of the roads was appalling in places, but my 1911 Model E Douglas purred away steadily, apparently oblivious of the pelting rain. Following the main road through Westerham, Reigate, and Dorking, Shere was reached punctually to schedule time at 3.30 p.m. The troops—a detachment from A and B company of the London Electrical Engineers—arrived at 4.30, and all sat down to a much appreciated meal. At 6.30 the main body were paraded and marched off in the direction of Peaslake, carrying sealed orders. The remainder gathered round their officer, who explained the night's work. It was supposed that an invading army was advancing from the South on to London. The London Electrical Engineers have been detailed off to locate the enemy, and on arriving at Shere they find that the enemy's cavalry have just left, retiring in the direction of Peaslake. Hence the defending forces throw out pickets who advance towards Peaslake and endeavour to locate the strength and position of the enemy's outposts. It will be seen from the map that there are four roads down to Peaslake. Pickets are sent down each of them, and the work of the motor cyclist was to keep in touch with the four advancing pickets and carry back information to the officers who were stationed at Burrows Cross. At 7.30 the defending party marched off and the pickets were sent down their respective roads. The country is very hilly, and the steady downpour assisted in making the test of the motor cycle a very severe one. On arrival at Burrows Cross I was sent off several times down the different roads to get any information.

The Beginning of the Battle.

Suddenly firing is heard to the West, and I scuttle off down to No. 1 road with lamp turned low to ascertain the news. The picket reports that the enemy's sentries have been encountered but have retired. This news is taken back as hard as the Douglas could go. After some time I was sent back along No. 1 road and came across one of the picket men returning with further information. He was promptly taken on the carrier back to his advance patrol, and back I went to report. By this time we had captured one of the enemy and were led to believe that they were advancing on Shere.



Accordingly the patrols on Nos. 3 and 4 roads were recalled to Burrows Cross, and here again the Douglas carrier helped.

Having concentrated on Burrows Cross we laid in wait at the cross-roads. It was so dark that one could only just see the road. After waiting some time I was told to ride off quietly with doused light and get some news of No. 1 road. Coasting down hill slowly I suddenly became aware of men in front, and found I was within twenty yards of two officers. Almost immediately I heard them challenged and give the enemy's countersign. With this news I hurry back and am then sent along No. 4 road. It speaks well for the Douglas that I got right through the enemy's sentries and pickets to their headquarters—Peaslake—and back without being challenged.

It appears afterwards that I was seen and fired at, but as the sentry only got a snapshot at me as I dashed across the road he was guarding, and as the man had omitted to load his rifle, I, of course, heard nothing of his well—or was it ill?—meant attention.

The Result.

Towards eleven o'clock we fell back to the railway bridge which we held until the "cease fire" was given. The umpires decided that the defending forces had succeeded in locating the whereabouts of the enemy to a satisfactory degree. They also considered the work of the motor cyclist was of extreme value because of the quickness in which the necessarily scattered pickets could communicate information to the officers

The roads on which the manœuvres took place described in the accompanying article.

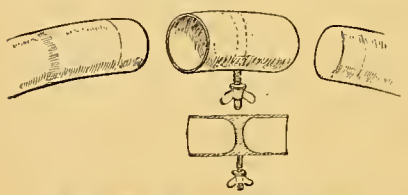
and also receive their orders. Without this aid the scheme would have been impracticable owing to the difficulty and delay in conveying information. I must say that my mount behaved splendidly through the most trying conditions—incessant rain and frightful roads. The two-speed gear enabled me to negotiate steep dark lanes slowly but surely, while the belt showed no sign of slipping, owing to the large countershaft pulley.

I have come to two conclusions. (1.) I am no longer afraid of skidding after those four hours of fast night riding on slippery chalk roads. (2.) Actual picket work at night is a vastly different thing from what I conceived it.

The nervous tension which one assumes when one is proceeding along an unknown road to endeavour to locate an unknown enemy in the dark must be experienced to be believed. E.C.Y

To Carry a Passenger or Camera.

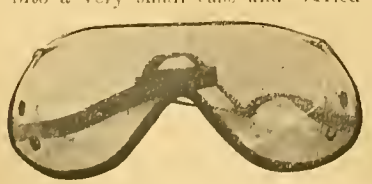
The accompanying illustration shows a method of carrying not only a passenger but a camera, or any other delicate article.



The Tynesider camera carrier.

In the latter case very light springs would be fitted. There is a piston at each corner, sliding in a guide and controlled by a spring; this prevents any swaying motion; it is light, strong, and moderate in price. The makers are the T. E. Henderson Co., 73, Camden Street, North Shields.

New Butted Tube and Goggles.



During a recent visit to the Service Co.'s showrooms, 292, High Holborn, W.C., we were shown some novel and interesting accessories which will be of interest to our readers. One of these is

Shrewsbury and Challiner butted tube.

the Shrewsbury and Challiner butt-ended inner tube. The two ends of the tube fit into a sleeve provided with an india-rubber division, immediately over which is a security bolt. Where the strain is greatest the tube is amply protected, and with this particular type it is claimed that bursting is impossible.

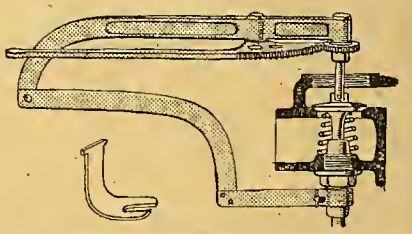
The next items shown to us were two new pattern goggles. The first pair of these is made of unbreakable mica and possesses the advantage of being folded up into a very small case and carried in

A neat pair of mica goggles sold by the Service Co.

the pocket. A second pair is rather more elaborately constructed, similarly fitted with unbreakable mica windows, which in this instance are tinted. The latter pair will fit over ordinary eyeglasses, and is sold in a neat chamois leather case.

Yet another novelty is a tool for cleaning and dressing leather belts. This has a wire scrub brush on one side for extracting grit from the surface of the belt, and on the other side a comparatively soft brush for applying the dressing. The Service belting is now made in 1in., 1¼in., and 1¼in. sizes for sidecar and cyclecar work, and a special dressing is supplied for keeping this belt in good condition.

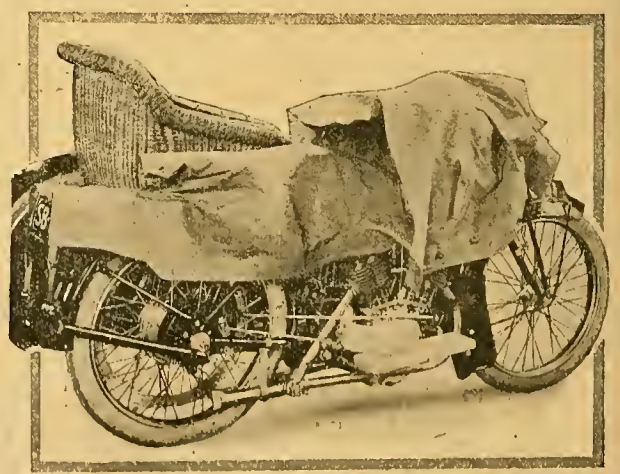
A Combined Suit and Machine Cover.



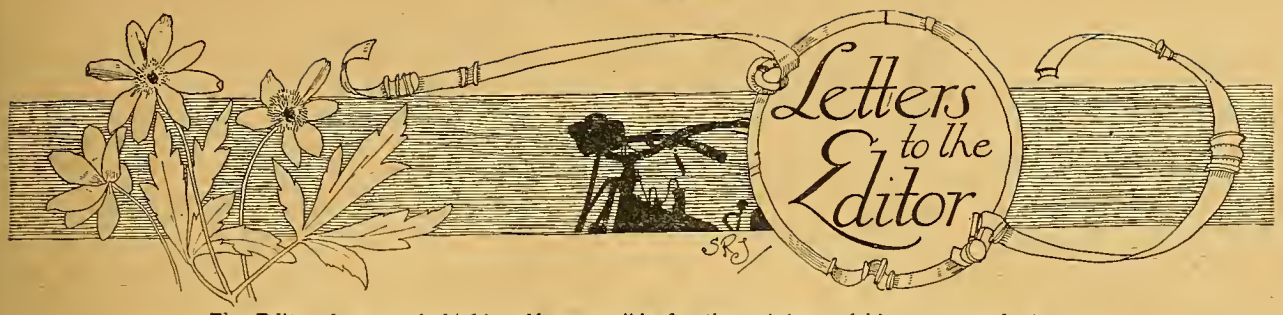
A novelty has been introduced by the Impervious Rubber Co., Ltd., 38, Falfield Street, Glasgow, in the shape of the Tirco coverall. This is a combined motor cycle mackintosh suit and machine cover. The makers say that it makes an ideal cover for the machine as well as for the rider. To wear the overalls, a belt is fastened round the waist, and the leg overalls are fastened by spring fasteners, the coat being put on in the ordinary way. To remove the suit, it is only necessary to give the springs a pull in the centre and pull the tab which is fitted at the knee, then unfasten the waist belt. To convert the suit to a cover for the machine, two special fasteners are fixed on the inside of the leggings to keep them extended, and the cover is then thrown over the machine, as shown in our illustration. The jacket is made with a storm front, storm straps, and wind cuffs to sleeves in rubber proof material, the proofing being guaranteed for two years.

A new combined waterproof coat and trouser overalls.

A Combined Valve-grinder and Spring Lifter.



A device which will facilitate the rapid grinding of a valve has been introduced by Bowden Wire, Ltd., 37-41, Pratt Street, Camden Town, N.W. This is one of the neatest of the many ingenious inventions for which this firm has been responsible; it can be operated in practically any position without dismantling the cylinder. For grinding, the two main members are gripped in the left hand, and the right hand is free to work the ratchet handle. The screwdriver-ended spindle, meshing with the teeth of the operating lever, locates itself automatically in the valve head saw cut, and does not slip out, while pressure on the valve



The Bowden Rapid valve grinder.

may be varied by the grip of the left hand. The clip of the lower arm is tightly screwed round the valve stem and a light spring is placed beneath the valve head, so that the latter is lifted off its seating when the pressure is released. By means of the gearing a rapid reciprocating movement is obtained.

The tool also serves as a valve spring lifter to enable the cotter to be removed. For removing the valve spring the L-shaped fork shown in the sketch is used in conjunction with the grinder, being attached to the end of the lower member by means of a butterfly nut. The screwdriver spindle holds the valve down while the spring is being lifted.

The Tirco coverall used as a cover for motor cycle and sidecar.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Tricar Conversions.

Sir,—The article on tricar conversions in the issue of May 16th must have been of great interest to the many users of old-type machines.

The writer is the owner of a 9 h.p. Riley (built in 1907) that has done excellent service, and is still running as well as ever, used as a runabout to save the expense of taking a large car out on short journeys.

I should be very glad indeed to hear of any reader who has successfully converted a tricar of this type to the modern sociable pattern, for I cannot see that there is any great difficulty in doing this. SOUTH CAROLINIAN.

Motor Cycle Taxation.

Sir,—As an enthusiastic cyclist and several years reader of your interesting journal, I was intensely interested in your editorial on motor cycle taxation.

I am a mechanical engineer with a large family and envy others who can afford a motor cycle. It is the tax that has prevented me owning a motor cycle, and if only it was lowered in the direction you have indicated, it would bring a second-hand lightweight within my reach. Having reached an age at which I find long journeys on my pedal cycle too much of a strain, I should be delighted to have a motor cycle to do long journeys and visit scenes enjoyed years ago.

I hope to see something done in the direction you have indicated. Wishing you continued success, J.E.K.

Damage to Hedges at Hill-climbs.

Sir,—I should like to draw attention to the way spectators at various hill-climbs (and particularly at Leathley Bank on Saturday, the 18th inst.) damage and break down the hedges and fences adjoining the steepest part of the hill selected.

This damage, I feel sure, is done unintentionally, nevertheless it is very hard lines on the farmer, who, as soon as everyone clears off, has to start and mend up his fences after each hill-climb.

I understand the tenants of the land adjoining Leathley Bank are going to apply to the Local Government Board to forbid the use of the hill for these climbs.

Hoping you will bring this before your readers and those who attend hill-climbs, thus warning them of the danger there is of putting a stop to a very fine sporting event.

A KEEN MOTOR CYCLIST WHO TAKES AN INTEREST IN THE FARMER.

The Cap Throwing Danger. Strength of Tyres.

Sir,—On my arrival home the other night, after riding from Holborn, *via* Hanwell and Staines, I was astonished to find a boy's cap lying on my footboard, within an inch of the driving chain. It had evidently been thrown at the machine in the dark, as I had not noticed anything *en route*. Had this cap moved another inch, it would have been caught up by the chains, and a bad smash to myself and machine would have been the probable result. Could not the A.A. or A.C.U. circularise head teachers of schools, asking them to point out to the children the dangers of this cap-throwing habit? I generally stop and "go for" the ildren myself when I see a cap thrown.

Most tyre makers draw attention to the thickness of the *tread*. If they gave us stouter *walls* and *beads*, we should be better satisfied. Four out of every five tyres I run burst at the walls, or bead, long before the tread (which is usually thick enough) is worn out. ENQUIRER.

Where Not to take out Licences.

Sir,—At Manningtree (Essex) on the 20th inst., a motor cyclist was fined four guineas and costs, and also had his licence endorsed, for riding his machine up a wide steep hill at 30 m.p.h. The rider was a most careful individual, and it was the first time he had fallen foul of the police.

At the same court, a barman, who had stolen many pounds, and candidly admitted it, was bound over to be of good behaviour for twelve months. Is this justice? Anyway, motor cyclists have means of at least showing their objection to such methods by taking out their motor cycle licences elsewhere. J. TIPPINS.

The Power Required for Sidecar Work.

Sir,—I enclose a photograph of my machine, which may be of interest, as it was through advice given in your paper that I made my choice, and I am glad to say that I chose a 6 h.p. Royal Enfield. I can take most hills on top gear, and even gain speed on a steep hill after having to slow down for traffic. Previously I had a 3½ and sidecar, but I found that I had to take the dust of cars more frequently

Photograph accompanying letter signed "A Long Stager."

than I cared for, and so I determined to purchase a more powerful machine, and now I can show most of these gentlemen a clean pair of heels.

The photograph was taken just before a 200 mile run, which commenced through the Vale of Evesham, where the blossom was so lovely that we crawled for miles on the low gear for the sake of inhaling the fragrance. The sidecar is so well sprung that my wife has lost all nervousness.

A LONG STAGER.

Sir,—I should like to add a word of warning to your readers not to be led blindly into following the example

of those riders of 3½ h.p. machines with sidecars who write rapturous letters to your paper after riding 1,000 miles. I rode one of these fitted with two-speed gear and clutch and up to 2,000 miles; I would have also written rapturously. After this distance my trouble began. The engine, of course, had been over-worked the whole time and various parts gave trouble—in particular the five rivets holding the crank-pin to the flywheel were always shearing off, necessitating taking down the whole engine, crank case and all, and several other parts required constant renewal.

The result of my experience is that for serious sidecar work, a 6 h.p. or 8 h.p. machine is required. A 3½ h.p. will do well enough for occasional sidecar work over good roads, where the low gear will not be frequently called into operation and where the engine is not being over-driven. A single-geared 3½ h.p. for this sort of work is absolutely out of the question, and I should certainly like to examine the engines of those enthusiasts who write to say what they have done with a single-geared 3½ h.p. combination after, say, 2,500 miles.

I have had seven machines, and my average mileage is 10,000 to 12,000 miles per annum with sidecar.

F. G. TOWNSEND.

Sir,—In the issue of the 16th inst. I notice a query and reply regarding the suitability of a 3½ h.p. single-cylinder machine for sidecar work; the machine referred to to be fitted with either a two-speed or Armstrong three-speed gear. You state in your reply, "Netherhall Gardens would just be about the limit for a 3½ h.p. single-cylinder," and further on you say, "You must, however, bear in mind that a 3½ h.p. does not allow very much reserve of power for sidecar work." My point is that the modern 3½ h.p. single is as near an ideal sidecar mount for the pure novice as can possibly be obtained. To variably geared singles stands the credit of the most wonderful performances since the invention of the sidecar. The Land's End to John-o'-Groat's record is held by a 3½ h.p. single and sidecar as is also the Irish End-to-end record, and the six days' sidecar record is also held by a single. Mr. Hugh Gibson recently climbed the dreaded Honister Pass with a Bradbury and empty sidecar, and in your issne of the 16th inst. is a photograph of the same rider climbing Arthur Street, Edinburgh, with three passengers, the combined weight being thirty-six stones, on a similar machine. Mr. Harry Long, in his attempt to cover 20,000 miles in six months, chose a single-cylinder Singer. He has already covered over 5,000 miles and reports "no trouble." Surely these instances ought to prove that the single-cylinder machine for sidecar is quite capable of the work it is called upon to do, and to the raw novice the complication of a twin-cylinder engine is entirely done away with. I should like to hear other readers' opinions. FRED W. ROBERTS.

Punctures.

Sir,— In the accounts of the various trials one sees frequent mention of tyre troubles owing to punctures, while in other parts of your paper one reads accounts of non-puncturable tyres, covers, bands, etc., besides solutions and powders which immediately stop any puncture. Is it because riders do not use these articles or because they do not fulfil all that their makers claim? VERATOR.

The Problem of the Automatic Carburetter.

Sir,—I notice that one or two of your correspondents are rather doubtful about the working of an automatic carburetter, and seem to think that it is not possible to get a perfect mixture at all speeds. Well, I have had some slight experience with most types of automatic car and motor cycle carburetters, and would be very pleased to hear of a carburetter that will give a perfect mixture at both slow and high speeds.

I notice that "E.M.O.," in referring to the Binks carburetter; says that it may give an explosive mixture but not a perfect mixture.

Some time ago I fitted a two-jet Binks carburetter to my 8 h.p. Zenith, and can honestly say that I have never had such a delightful carburetter to control. It is perfectly automatic at all speeds, and engine runs very slowly. As regards the speed it is capable of, I think the fact that my 8 h.p. Zenith ridden by Mr. Griffith and myself when we climbed Arms Hill, Henley-on Thames, to quote your own words, "at terrific speed," is proof sufficient in itself. I think it is the best carburetter I have yet tried, and am still using it.

I need hardly say that I have no interest in Binks carburetters, but I like to give honour to whom honour is due.

W. L. T. RHYS.

Sir,—Your correspondent "J.G.B." has, consciously or unconsciously, hit upon the touchstone by which the true automatic carburetter can be recognised.

No definition of the ideal automatic carburetter has, so far as I am aware, been published in your columns, and perhaps you will allow me to quote Mr. Dugald Clerk's requirements as stated in a paper on "Principles of Carburetting as determined by Exhaust Gas Analysis."

"An ideal compensating contrivance should vary not with varying speed, but with varying quantity of mixture drawn in in a given time. In a car running on the road, for example, the speed of the engine may be kept perfectly constant, but the position of the throttle will vary from point to point on the road, that is, engine speed will be constant, but the volume taken into the engine may vary within large limits. The problem is to charge any given volume of air passing into the engine with a practically unvarying proportion of petrol vapour in a uniform manner.

One might add to this that the proportioning of air and petrol should not, on the other hand, depend on the amount of throttle opening, as an engine might have the throttle set wide open and yet vary in speed over wide limits under varying loads on the road.

Therefore the petrol supply should be controlled by the amount of air passing through the carburetter, and not by the position of the throttle.

Examine the so-called automatic carburetters in the light of these definitions, and one finds that nearly all fail as automatic carburetters, for it is obvious that it should be possible to eliminate entirely the throttle and work on variable-lift inlet valves, and still rely on an unvarying and correct mixture at all speeds.

The carburetter so eloquently described by your correspondent, Mr. G. Duncan, depends on throttle position, and would be useless with variable lift inlets, as would also all multiple-jet instruments.

In my opinion the only one besides the Fafnir which is scientifically a true automatic carburetter is the Stewart-Precision, and I have recently confirmed its capacity for running with variable lift inlet valves by an actual test, which was in every way satisfactory.

F. N. PICKETT.

Edwin T. Heys, of the Manchester Repertory Theatre, lately accomplished an excellent run from Manchester to London on his Dot machine and sidecar, covering the journey without a single involuntary stop. Mr. Heys is now business manager of Miss Horniman's company at the Coronet Theatre, Notting Hill Gate, W. He does all his travelling about on his motor cycle.

Sir,—From the letters which have appeared in your paper, it is evident that the action of automatic carburetters is very little understood. I will endeavour to explain how my two-jet automatic carburetter works.

In this instrument there are two jets each in a separate choke tube; these jets are controlled by a piston throttle. When the piston is right down both jets are shut off. A movement of the piston begins to uncover the small jet which is situated in a very small choke tube, so when the engine is only just turning round, the velocity of air up this choke tube is very great, giving instant starting and very slow pulling. Speed increases as the throttle is further opened until the full limit of power off the small jet is obtained. By this time the mixture is a shade on the rich side, which is necessary for great flexibility. When more power is required, the throttle is further opened and it begins to uncover the main choke tube: air begins to flow through this choke tube, and dilutes the mixture on the small jet, thus giving a more explosive mixture and increasing its volume, this giving more speed; a further opening of the throttle causes petrol to begin to spray out of the main jet, and speed gradually increases until the main choke tube is completely uncovered. As the suction *increases* on the main jet, it *decreases* on the small jet, and this gives a pretty constant mixture throughout, the tendency being, when the main jet is fully uncovered, for the mixture to be a shade on the rich side. However, to accommodate this, a further opening of the throttle, which is all done with one lever, begins to uncover a large air port by which the mixture may be thinned down as much as desired. The sizes of the jet and main choke tube are of vital importance, and as in this carburetter the jets and choke tube can be changed or varied in less than a minute on the road, it is the easiest thing possible to get the correct combination which will allow the throttle to be slammed open and the most violent acceleration obtained. Your correspondent who states that the same results are obtained by moving both levers of a non-automatic carburetter together is hopelessly at fault, and if he will call at my works, I shall be pleased to demonstrate this fact to him, or any other of your readers who are interested. Whatever others may have done, I have totally failed to make a really automatic carburetter which depends on a single jet. When once the idea is grasped of the two jets working together, one automatically correcting the other, then the fact that the automatic carburetter is really satisfactory will be appreciated.

I have noticed in hundreds of instances when just cresting the top of a steep hill, when the engine would otherwise have given out on any carburetter, that shutting the throttle down so that it comes back on to the small jet only will actually cause the engine to "pick up" again, as the velocity past the jet will be actually increased when the engine is running dead slow, whereas in a single jet carburetter the velocity would be insufficient to cause the petrol to spray out at all.

CHAS. BINKS.

Sir,—I was most interested in the recent articles on the problem of automatic carburetters. I agree with "Ubique" in his prediction that the automatic carburetter will take its place as standard on the touring machine of the future, although I think for track riding the two lever type will hold its own. The average business man and the tourist who rides in traffic and on country roads, are the people who can fully appreciate the simplicity of the single lever control.

A few days ago I had the pleasure of witnessing a machine fitted with a B.C.B. floatless automatic carburetter give a very fine performance. It was very interesting to watch the way in which it would crawl through traffic, and the quick pick up by just a turn of the throttle, together with its exceptional hill-climbing power, was to me most convincing. This carburetter does not seem to be very popular, although there are several running about here (Halstead). I do not think it has been on the market many weeks. The rider of the machine informed me that the supply of air in this particular carburetter is admitted through a spring controlled valve, which allows air to pass it in varied quantities according to the speed of the engine, and not in accordance with the throttle position. Therefore the mixture is not weakened when the engine is tugging up stiff hills on full throttle.

CARBURETTER.

[Correspondents are urged to be as brief as possible or their letters will be curtailed.—ED.]

The Mobilisation Scheme.

Sir,—I intend to compete in the National Mobilisation run as outlined in your issue of the 9th inst. Can you tell me my position if I am summoned for riding over 20 m.p.h. in this event? Do the War Office authorities indemnify me against any fine, or do I take all risks?

FRED DOVER.

Sir,—I have read with interest of the proposed Mobilisation Scheme under the heading of "Military Motor Cycle Notes" in your issue of the 16th inst. As a motor cyclist, and a member of the Automobile Association and Motor Union, I feel, however, bound to protest against that portion of the scheme which is described as a "speed test." Everyone knows by now what speed a motor cycle can attain—if there is any doubt about it, there is always a racing track on which the proposed test can be carried out—and by having a competition in which competitors have to return home with "all speed" simply means that the winner will be the competitor who is prepared to take the greatest risk as regards cross roads, other vehicles, and scorching through towns and villages, to the annoyance of the inhabitants. Such behaviour is only calculated to bring motor cycling into disrepute, and invite police interference. I sincerely trust that *The Motor Cycle* will not be guilty of encouraging such practices. If you can arrange the competition in order to demonstrate how large a percentage of the competitors can return home at a reasonable pace, without stoppages for repairs, etc., you will, I am certain, be doing far more to further the cause of military motor cycling than you will be if the competition is carried out on the lines suggested.

GEORGE BIRCH.

[The War Office cannot interfere in the matter of police traps; if riders exceed the limit, they do so at their own risk. With regard to the second letter, it has now been decided that the return journey shall not be a *speed* test.—ED.]

Should Ladies Race?

Sir,—I was sorry to read your leaderette "Should Ladies Race?" as I think you are a little unfair in your views. In my humble opinion we should be allowed to enter for speed events, and the very fact of our wishing to ride in these competitions plainly shows that we are not likely to suffer from "Nerves."

After all an odd accident or two should not cause a scare—look at the crowds of accidents men riders have, and yet they all continue to enter for competitions.

The majority of women will be content with touring, etc., but some of us who are really keen on hill-climbs and have had years of experience would feel it rather hard if we were to be shut out from all the sporting events.

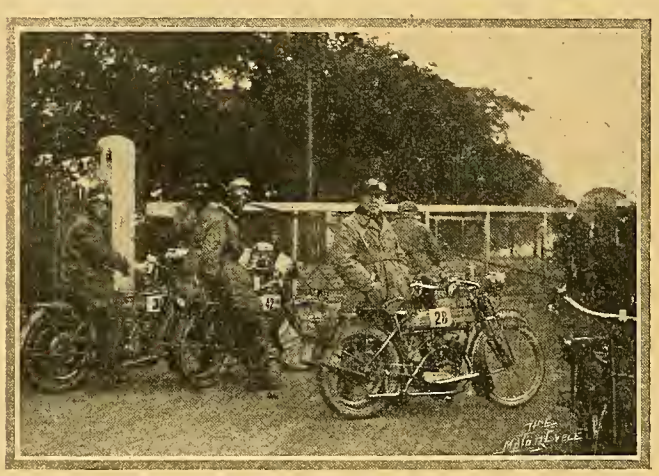
I hope other lady riders will send in their views on this subject.

MURIEL HIND.

Sir,—Would you allow me, through the columns of your widely circulated paper, to thank all the kind friends who have written, telephoned, or called at the cottage hospital since my accident a week ago. Fortunately my fall was not a very serious one, and I hope to be out of hospital in a few days. I was sorry to read your article concerning ladies competing in hill-climbs in last week's issue. I should be very sorry indeed should our entries be refused in the future. I do not think there is any more danger in racing for women than men. I certainly have fallen, but mine is not the first accident that has happened in a hill-climb, often an expert man rider has come to grief. I should like to hear the views of your lady readers on this subject.

N. HOUGH.

SUMMARY OF CORRESPONDENCE.



J. F. Cramp asks, and we think with reason, why the Warwickshire County Council do not have the Coventry-Kenilworth main road properly mended and then tar treated? He says, "If the Coventry-Dunchurch Road can be tarred to prevent the dust nuisance, surely the Kenilworth Road is worthy of equally careful treatment.

Will any reader residing within a reasonable distance of Catford, S.E., who feels capable of tackling a difficult problem in connection with a motor cycle engine of old type, kindly communicate with "Perplexed," c/o the Editor.

THE LONDON TO EDINBURGH RUN.

Another Record Entry, and a Long List of Survivors.

FOR the ninth time in succession the Motor Cycling Club's London to Edinburgh run has been a great success. It might be said that the first time the competition was held, it made the Motor Cycling Club, while every subsequent occasion adds a jewel to its crown. The very words London to Edinburgh have magic in them. Their very sound has a magnetic attraction which draws irresistibly, and this year attracted another record entry. It is solely the idea of covering the distance of 400 odd miles between the two capitals inside twenty-four hours

At Sutton Crossing on the Great North Road in the early morning of Saturday. The competitors are A. J. Duncan (Rex), S. Savage (Triumph), H Greaves (2¾ Enfield).

which fascinates the entrant. The drive is not difficult, and very little of it is even pretty. To accomplish it is ridiculously easy. It means simply sitting still for most of the time and letting the machine do the rest, and success almost certainly awaits anyone who can stand the fatigue, and motor cycle riding renders one so extraordinarily fit that there are very few who cannot. To gain one of the special cups the rules are rather more irksome, as schedule time has to be vigorously observed, and success awaits not necessarily the man with the best machine or the best driver, but him who best can guess his speed. Someone suggested bringing in Sutton Bank, which could have been easily done, as the men pass within sight of it after York, and to climb it, say, on formula, after a 220 miles run, would be a really sporting effort, and one really worthy of serious consideration in our opinion, but we fear this suggestion is rather against the M.C.C. idea of what the run should be. What think our readers?

Perfect Conditions.

To revert to the 1912 event. No better weather conditions could possibly have existed. A clear night followed a dull day. Clouds faded from the sky after sunset, and as the daylight waned a bright half-moon *behind* the men shed its soft and cheering rays on the highway. The starting point, that fine open space beginning at the Old Gatehouse Inn, Highgate, was packed with denser throngs than ever an hour previous to the start. Anybody who was anybody in the motor cycling world was there, and a right busy scene it was. Years of experience have taught the M.C.C. officials how to do things, and they have profited. Everything is now splendidly organised. A rapid glance over the machines revealed several points of interest. Commodore Sir R. K. Arbuthnot was there, having travelled all the way from Invergordon specially to compete. G. N. Higgs for the first time had entered a 2 h.p. Alcyon in company with the well-known exponent of that make, N. D. Slatter. Slatter's mount was enamelled blue and was labelled the Blue Bird. The P. and M.'s entered, as they always do, looked surprisingly neat and clean. The method of carrying route cards employed by several was interesting. That fine old veteran, Applebee, sen. (Centaur), the hero of a hundred canine encounters, slipped his round the lamp generator and held it on by means of elastic bands. Charlesworth, a Zenith rider, carried his secure from the elements in a mica case.

Equipment.

W. H. Bedford (Rex-Jap and sc.) had a new and smart-looking electric lamp, the "Nups," by Husband, of Leicester, which was certainly novel in appearance, and possessed a fine compound lens. H. C. Mills (Premier), Hemy (Service), and others more intimately connected with the industry, carried illuminated signs denoting the make of machine they rode. Howard (Zenith and sc.) employed a neat back-rest and a very complete set of touring bags; Karslake, on his invincible Rover, used a big F.R.S. and two Cox-Walker electric lamps, and round his waist was slung an inspection lamp for reading his route card, which, we hear, will shortly be placed on the market by Messrs. Siemens. Gwynne (Indian) relied on two Cox-Walker lamps and a Siemens battery only; Letchworth (Bat) carried a

An unofficial check at the G.N.R. crossing, Sutton Notts. The riders getting away after the train had passed.

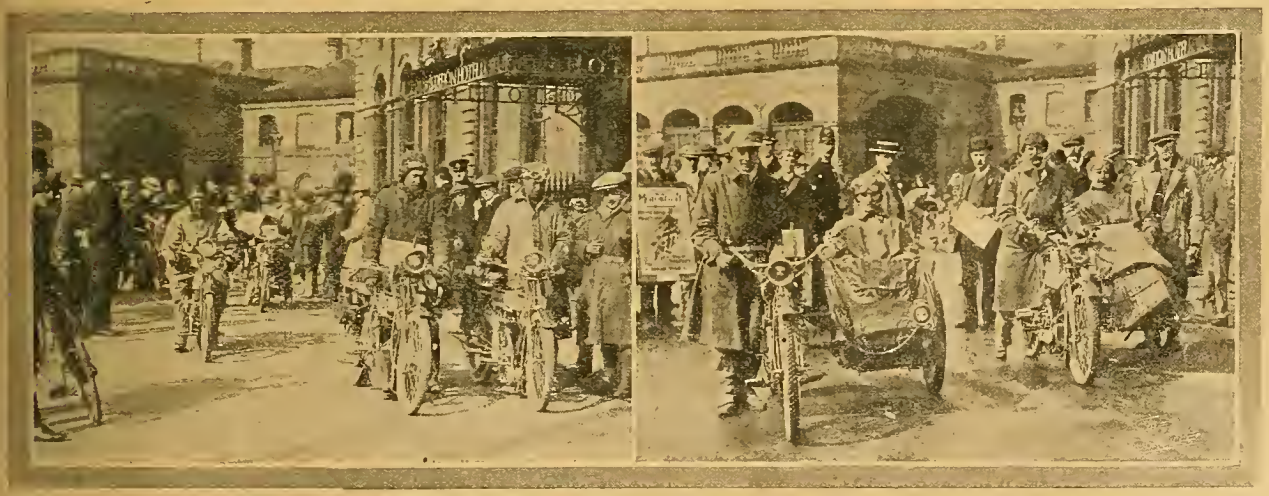
The London to Edinburgh Run.—

A halt outside Doncaster, showing H. Huckle (Zenith and sidecar), Hugh Gibson, J. J. Day, and A. Abbot (all on 3½ Bradbury sidecars.)

big brass car lamp; Kerry (N.S.U.) used three baby acetylene lamps and one big Duco; E. B. Dickon (Bat) used the same front Dunlop tyre he used in the London to Edinburgh run last year, and strapped two spare inner tubes to each side of his tank—these acted as knee pads; Pratt this time rode a P. and M. and sidecar gaily lighted by three lamps; Griffith was mounted on a smart-looking Alldays, possessing a wide tank of sensible capacity and a short frame; Wasling (Enfield) carried a big electric car head light, lit by a high voltage battery, and beneath it, mounted on a board, a car clock.

Previous to the start the officials were working their hardest to get their various duties done. Messrs. Seed and Gibbons were busy doling out numbers, which this year were fastened to the side of the tanks; Messrs. Bilney, Collins, Snell, and Blyton looked after the motor bicycles; Messrs. Butterfield and Wightman were busy with the sidecar machines and cyclecars; while it fell to Mr. S. H. Fry's lot to look after the cars.

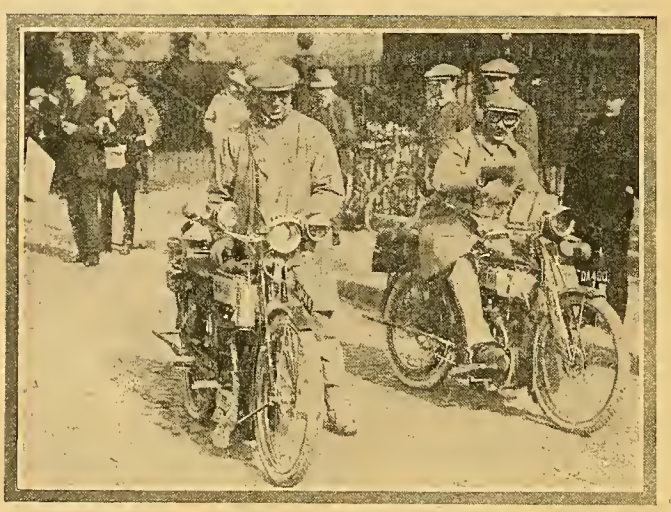
When nine o'clock approached, night was turned into day by means of Liversedge portable acetylene lights, under the glare of which Messrs. F. T. Bidlake and G. F. Sharp despatched the men. Ten minutes before the start Mr. Charles Jarrott, president of the M.C.C., moved off in his Rolls-Royce, bearing the two travelling marshals, Messrs. R. H. Head (chairman) and A. Candler (former secretary).



The Start.

The first man to be despatched was H. G. Bell (F.N.), on whose broad shoulders fell the responsibility of the organisation, and well indeed did he deserve the right to carry No. 1. Southcomb May, the hon. secretary, rode a Portland-Jap and sidecar. Both members of *The Motor Cycle* staff who followed the run were well mounted—one on a 3½ h.p. Zenith and the other on the 2½ h.p. Motosacoche, the excellent behaviour of which has previously been referred to in these pages. Guest (Matchless and sc.) after the start hit a tram and ran on to the pavement. Once under way the cold began to be felt, and when the suburbs were left behind it became intense. All along the route interested spectators on motor cycles turned out to see the men go by, and most of them, we regret to record, inconsiderately turned their head lights so that the unfortunate competitors had to face their full glare. The first check was at Hatfield, outside Water's garage, and this point was reached without incident. The roads were in splendid condition, and there was very little dust. The writer rode the Zenith, which pulled well, and, thanks to the fascinating Gradua gear, was a real pleasure to drive, especially up Digswell and all other hills encountered, where a touch of the gear handle eased the load and sent the engine roaring up the slope. The way through Welwyn was shown by willing helpers, and then followed an easy run through Stevenage to Baldock, after which the straight Roman road to Biggleswade was taken.

Tyre Troubles.



Three miles from this town my back tyre collapsed, due to the butt-ended tube blowing out. Then there ensued half an hour's struggle with the new tube, the valve of which refused to go in its hole. All the assistance available was from a semi-drunken countryman, and was of little use. Meanwhile the competitors sped by in shoals—a most extraordinary sight. Finally, I had to beg for the assistance of someone, and the first man I hailed turned out to be Cyril Patteson (accompanied by C. J. Feeney, both on Moto-Rêves), who, even though he was a Cup man, gladly gave most welcome and skilful aid. Poor fellow, he deserved a better fate, as in poor return for his charitable assistance his engine seized up before Doncaster was reached.

The excellent refreshments at the Swan Hotel, Biggleswade, put new life into us. Coffee is a mild stimulant, and warms the interior better than any other beverage. The lamps the Zenith carried were an ordinary Broadhurst acetylene and a C.A.V. electric which Messrs. Vandervell fixed up specially for the trip. Soon after Hatfield I realised the lamp was tilted too much downwards, but, thanks to the simple way in which it was carried, it was possible to alter the angle while running. This lamp gave an excellent light, and was no trouble until one of the Simplex terminals gave way near Eaton Socon. Now the writer has his own method of securing Simplex terminals, and the fact that one he himself had dealt with did not come loose was distinctly pleasing. The tip is a simple one to follow. Fix the terminal in the usual way, and before hammering it up loop a thin piece of copper wire round the groove, and twist the ends round the insulated portion of the cable, and then hammer it up.

(1) Leaving the York Control. W. B. Gibb (Douglas), E. A. Colliver (Zenith), and C. T. Newsome (Rover) at the Station Hotel. (2) B. Alan Hill (7 h.p. Indian sidecar), and J. J. Day (Bradbury sidecar).

The London to Edinburgh Run.—

Com. Sir. R. K. Arbuthnot, R.N. (3½ h.p. Triumph), and T. H. Haddock 2¾ h.p. (A.J.S.) about to leave York.

Meanwhile a respectable-looking young Scot, who, poor fellow, was walking to Edinburgh, and said he hoped to get a lift from someone in the competition, came up and held the matches while the break was seen to. The delay through the puncture was a serious set-back, and the Zenith was now among the sidecars and enveloped in their dust. Everybody was travelling as fast as was safe in the dark, and it was somewhat difficult to get away from them. However, at Alconbury, as it always does if the weather be fine, a welcome glimmer appeared in the east, the road broadened out, and in the increasing light the dusty sidecars were left behind.

The First Surprise Check.

Near Norman Cross the Cup men had to stop for a surprise check. The section from Eaton Socon to Norman Cross is famous for its much-betrapped villages, and it was quite curious by night to go through them at legal limit, while by day 17 m.p.h. incurs a heavy fine. In nearly every village some enthusiasts were about to watch the long procession. Just when it was light enough to see both the lamps on the Zenith went out, but, fortunately, it was just possible to do without them. I stopped for a stretch on the hill leading into Stamford, and Eli Clark came up and reported his back tyre had come off some way back. The Zenith rapidly forged ahead, and dropped into Grantham, having made up much lost time. The fine yard at the George Hotel was thronged with machines, and the smart way in which the machines were filled up with petrol reflects great credit on the organisers.

The worst part of the journey was over, and the men fortified by breakfast, the next section was tackled with lighter hearts and in better spirits. Incidents during the night run were few and far between. In the early days men used to fall asleep and tumble off, but cases of this kind are now unknown. Lamp troubles used to be frequent, but now the use of several lamps, or of one lamp and two generators, has changed all this. Lamps, however, still get loose, and one or two men were seen carrying their head lights on the luggage carrier. Beyond Newark was the second check for those entered for the cup. At Crow Park level crossing the Zenith overtook the vanguard, nearly thirty being hung up by the gates being closed. The pace was now reduced, and the run into Doncaster made "under easy steam." The road from Bawtry into Doncaster was very rough, and on this portion my accumulator box, though provided with clips riveted and soldered on, began to come adrift. Both straps holding in the accumulators broke loose and the two latter were lost, all of which teaches its own lesson. The C.A.V. lamp itself was a great success and a real comfort, and a little extra care over the accumulator terminals and the method of carrying the batteries themselves would have saved all trouble. Corcutt's garage was the first check after breakfast, and here Sir R. K. Arbuthuot, W. Cooper, Haddock, and Wasling were signing on as I arrived. Over the remainder of the section the roads were rather rough. York was reached at 7.15, after an easy run in a warmer and more congenial temperature, through Ferrybridge and Tadcaster.

Incidents of the Night.

Here Mr. Charles Jarrott watched a number of the early arrivals sign on, while a few of the comparatively scanty incidents of the first half of the journey came to light. S. B. White (Service) reported valve trouble, while Higgs (Alcyon), whom I had seen stopped some miles back with Slatter helping him, had been in similar difficulties. Brough arrived with a marvellously clean engine and an untarnished exhaust pipe. Bellchamber (Rover) reported an internal short in his enclosed magneto, which he traced and remedied without difficulty. Several entered for the cup became bored with the tedious necessity of keeping dead on schedule and continued the journey without heeding the necessary restrictions. Among these were Jacobs and Applebee. R. C. Davis arrived with a flat tyre, while Chater-Lea (Chater-Lea sc.) had a puncture before Grantham. Southcomb May was delayed somewhat by the carbon brush holders of his magneto coming loose. Huckle (Zenith sc.) suffered carburetter trouble. White (Rex sc.) reported delay through a loose magneto sprocket. L. E. Cass (Quadrant sc.) had had trouble with the cones on his Armstrong gear coming undone. The York check, where breakfast was served, was in the capable hands of the Rev. E. W. Gedge.

At York a water cart had been busy on the tram lines, and several riders were performing complicated evolutions in consequence. At Easingfold, some thirteen miles from York, came the first secret check in the second section, set with some skill.

The roads continued good, and the coldness of the morning was gradually overcome by the sun until it was as warm as could be wished. Nearly all the way between York and Newcastle the competitors were bunched more closely together, and this afforded an excellent opportunity of studying the running of the various makes. In particular the two Motosacoches were interesting, as they were getting along at a steady pace, which pace, to one riding a heavy single, came as a surprise. Certainly these small machines have wonderful engines.

At Northallerton, Croft, and Neville's Cross were more checks, the two latter being in the nature of a surprise. Newcastle would have proved an awkward place to negotiate but for the excellent way in which the police held up all traffic for the competitors. The control was outside the Newcastle and District Motor Club, and its arrangement was excellent in every way. On arrival the machine was taken away and placed in the square opposite the club, while the rider signed on and made a rush for lunch and a wash. Petrol and oil were easily got, and there was no difficulty or unnecessary delay. Before the leading singles left the

R. O. Clark (2¾ h.p. F.N. and sidecar) travelling at a good speed between York and Newcastle. The photograph was taken from a sidecar just following. Clark's F.N. is the smallest engine to complete the double journey with a sidecar and passenger.

W. Cooper (Bradbury), D. S. Baddeley (Baddeley), and P. Phillips (Douglas) passing through Dringhouses near York.

first sidecars were arriviug, all looking well and apparently running to time. The light F.N. and sidecar seemed especially cursed with tyre troubles, a fate which this small engined combination by no means deserved. Out of Newcastle the road is the worst in England, and as no care had been bestowed on it the bumping was awful.

Caught in a Surprise Check.

At Morpeth there was another check, and thereafter to Alnwick the vile surface played havoc with the accessories. At Belford a neat surprise check caused an unseemly flutter, quite half-a-dozen riders hastily concealing themselves behind a stone wall and consulting watches. In many cases the check was too much for them, especially as a marshal walked out and caught them redhanded as it were. From Alnwick and Berwick the road was slightly better with several curves and sharp turns on which many emphasised their cornering. At Berwick a sharp left turn and a steep rise, ending in a sudden turn up a gradient, led to a paved yard and to the tea control. Tea was served in a very old and spacious dancing hall. Outside the clanking was worth hearing, as new arrivals realised a second too late what the gradient really was. Quite an unusual number turned up with their lamps, whose gorgeous and complicated arrangements had been their joy at Highgate, tied on their carriers in a crumpled condition.

Scotland at last!

Some miles outside Berwick one of the Douglas riders passed astride the carrier of another Douglas. He had suffered a stripped timing gear at Berwick. Here also the Swift had sprung a bad leak in its tank, and it was only by doing much temporary repairing that the machine was driven to Edinburgh. Into Cockburnspath, where there was another control, the road was again vile, and everyone was horribly shaken. The Scots, as usual, were most enthusiastic, every village being crowded. Checks were situated in both Dunbar and Haddington. The final ones before East Preston Street were the last on the journey. Thereafter the speed of all seemed to increase, as no less than ten machines passed going fast into Edinburgh, making clouds of particularly penetrating dust. Then at last Edinburgh was reached, with crowds of people all standing in the road as close to the competitors as possible. Fortunately, the Edinburgh police are excellent traffic managers, but even then it took an open cut-out and a low gear, shouts, and, in fact, all the noise possible to reach the Royal Hotel in safety.

Extraordinarily little trouble was noticed on this trip. Here and there, it is true, tyre troubles such as delayed Haswell's two-speed Triumph, the A.S.L., and the F.N. lightweight were encountered, and occasionally some man with a sooted plug or belt trouble was to be seen, but in the main nothing interesting was apparent, and it was not until the finish that any incidents could be learned.

W. P. Tippett (Humber), and N. D. Slatter (Alcyon) at the finish of the run.

Unfortunately, two accidents involving some injury to the riders have to be recorded. Marians hurt his arm through a saddle spring breaking, and McKechnie, on the Dot, broke his collar bone, due to a burst tyre. Luckily, a man with a knowledge of first-aid was present, and by the time a doctor (who was also a sidecar passenger) came Marians's arm had been bandaged up. McKechnie was removed to Morpeth by the driver of a private car, who very kindly cleared out all his passengers in order to accommodate the injured man. Howe, on a Rudge, ran into the roadside during the night, and appeared considerably dazed when picked up, but was otherwise unhurt. North upset his sidecar and himself at a corner, due, it is said, to his passenger being asleep and not hearing the request to lean out. Frankenstein also arrived at Edinburgh with a smashed lamp and buckled front mudguard, while another report speaks of a smashed Rex beyond Morpeth.

Few Accidents.

Mechanical breakages seemed fairly rare, except for the number of lamp brackets already referred to, but a Service broke its frame and the already mentioned Swift suffered a leaky tank. R. Lord (Rex) had three punctures and endured belt trouble on two occasions, these latter both occurring within easy reach of the finish. Gerald Bunn (A.S.L.) had

Competitors' machines ranged in the Newcastle Motor Club Gardens.

The London to Edinburgh Run.—
the flattest head lamp that has been seen for some time, due to charging a wall at Morpeth.

All arrangements for meals and refreshments were carried out as well as could have been wished, and all seem to have enjoyed themselves to the full.

In Alexander's garage a great deal of work was being put into the various machines preparatory to the return journey. Boswell (Ariel) had a leaking tank, Letchworth (Bat), Peppercorn (Baddeley), Webb (Bradbury), and Deacock (N.L.G.) all had smashed lamps or brackets to attend to, Beal (N.S.U.), was busy with a new oil pipe nipple, Wasling (Enfield) repairing a mudguard, while on the G.W.K. a cover had been changed and the friction wheel replaced, as it had been badly scored during the run. On the small F.N. and sidecar the seat pillar and inlet pipe were repaired while the driver and passenger were busy with the rear tyre.

Great credit is due to the 2½ h.p. Motosacoche and the 3½ h.p. Zenith, the excellent running of which is responsible for the punctual arrival of our representatives. The Zenith was shod with Kempshall covers, which gave absolutely no trouble. The tube which failed at Biggleswade was not of the same manufacture as the tyres. Among the silver medallists, Roy Walker owed his had luck to tyre troubles. Great credit is due to the cyclecars which came through. The G.W.K., A.C., Morgan, Chater-Lea, the *élite* of this type, did extremely well. E.M.P.B.

List of Medal Winners.

The following are the results of the outward journey, subject to confirmation:

* Signifies that member entered for the Motor Cycling Club Challenge Cup.

† Signifies that member entered for the Special Gold Medal Return Journey Competition.

c Signifies that member entered for the Clark Cup (double journey).

w Signifies that member entered for the Wells Cup (single journey).

Gold Medals.

Harry G. Bell (5-6 F.N.)
Com. Sir R. K. Arbuthnot (3½ Triumph)
*P. Phillips (2¾ Douglas)
D. S. Baddeley (6 Baddeley)
*Joseph Stevens (2¼ A.J.S.)
†W. Cooper (3½ Bradbury)
*T. H. Haddock (2¼ A.J.S.)
*W. P. Tippett (3½ Humber)
†N. D. Slatter (2 Alcyon)
*Edward Pond (3½ Rudge)
J. Marians (6 Zenith)
*A. J. Dixon (3½ Singer)
F. E. Wasling (2¾ Enfield)
*P. Shaw (3½ P. and M.)
†A. V. Deacock (6 N.L.G.)
*F. W. Applebee (2¾ Centaur)
W. Price (5½ Cleveland)
*Gerald Bunn (3½ A.S.L.)
†A. Webster (2¼ Handy Hobart)
*H. J. Beal (3 N.S.U.)
*R. G. Charlesworth (3½ Zenith)
*G. Boswell (3½ T.T. Ariel)
A. J. Duncan (6 Rex)
*F. J. Watson (3½ Swift)
*H. Greaves (2¾ Enfield)
Daniel Barratt (3½ Triumph)
*A. T. Stanton (3½ Bradbury)
A. E. Catt (3½ Triumph)
*Harold Karslake (3½ Rover)
Edwin Gwynne (7 Indian)
*D. W. Popplewell (3½ Triumph)

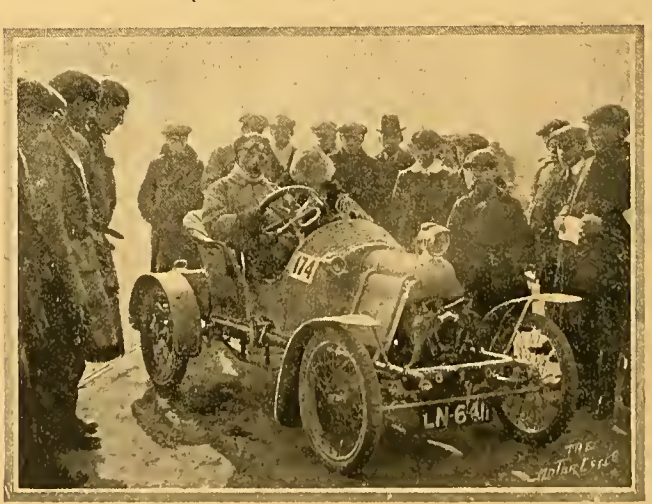
The Return Journey.

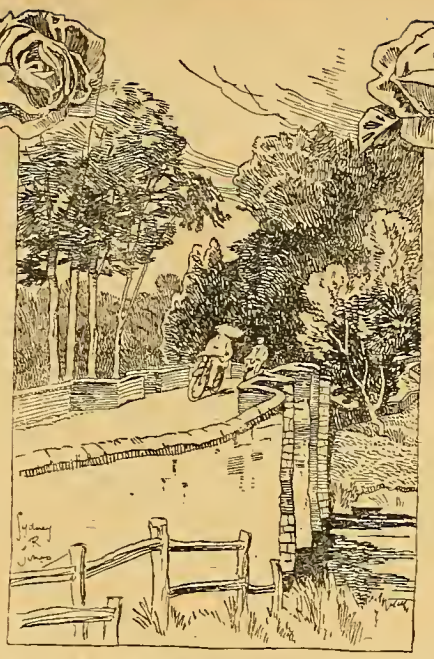
Glorious weather again favoured those of the competitors who had entered for the return journey, of whom seventy-four had been timed out of Edinburgh by F. T. Bidlake. The first man left at just after 2 o'clock on Monday morning. During the first part of the trip it was very cold, but later the weather was warm, though the dust was trying. A large crowd assembled at Barnet to welcome the arrivals, the first of whom to be greeted was Charles Jarrott. Nearly every man questioned declared he had had a glorious run, and of incidents there appeared to be hardly any to record.



The first competitor to sign on was W. Cooper at 10.30, who brought the news that Brough was running to a second, and that despite two punctures north of York he had reached the control punctually. Two men carried extra passengers. Begley had Baker on his carrier, whom he had carried on part of the outward journey and all the way back. Baker had had trouble with a bearing. Dew had timing gear trouble at Berwick on the way north, and was brought in by Fletcher, while Pither suffered tyre trouble. The following reached Barnet:

Phillips (2¾ Douglas)
Stevens (2¼ A.J.S.)
Cooper (3½ Bradbury)
Haddock (2¼ A.J.S.)
Tippett (3½ Humber)
Slatter (2 Alcyon)
Dixon (3½ Singer)
Shaw (3½ P. and M.)
Deacock (6 N.L.G.)
Appleton (2¾ Centaur)
Webster (2¼ Hobart)
Beal (3 N.S.U.)
Charlesworth (3½ Zenith)
Boswell (3½ Ariel)
Watson (3½ Swift)
Greaves (2¾ Enfield)
Karslake (3½ Rover)
Popplewell (3½ Triumph)
Wasley (2¾ Douglas)
Robbins (3½ Humber)
Noble (3½ Rover)
Colliver (3½ Zenith)
Roots (3½ Singer)
Gibb (2¾ Douglas)
Eli Clark (2¾ Douglas)
Newsome (3½ Rover)
Croucher (3½ Kerry-Abingdon)
Henry (3½ Service)
Davidson (3½ Kerry-Abingdon)
Brough (3½ Brough)
Gray (3½ Rudge)
Bellchamber (3½ Rover)
Holroyd (2½ Motosacoche)
Lovett (3½ Triumph)
Begley (2¾ Hazlewood)
Campbell (3½ Rudge)
Fletcher (2¾ Douglas)
Le Vack (2½ Motosacoche)
Mills (3½ Premier)
Guiver (3½ Rudge)
Garrett (2½ Premier)
Griffiths (3½ Alldays)
Walsgrove (2½ Moto-Reve)
Slingo (3½ Rover)
Guest (8 Matchless sc.)
Davis (8 Chater-Lea sc.)
Beasley (3½ Rover sc.)
Clark (2¾ F.N. sc.)
Pither (6 Enfield sc.)
Bedford (6 Rex-Jap)
Meredith (3½ Bradbury sc.)
Hull (7 Indian sc.)
North (3½ Ariel sc.)
Haswell (3½ Triumph sc.)
Hill (7 Indian sc.)
Smith (5 Clyno sc.)
Huckle (6 Zenith sc.)
Abbot (3½ Bradbury sc.)
Proctor (7 Indian sc.)
Halsall (8 Matchless sc.)
Morgan (8 Morgan)
Wood (8 G.W.K.)

The engine dimensions of R. O. Clark's 2¾ F.N. sc. were 65 by 85 mm., the smallest sidecar machine ever seen in this competition; a really wonderful performance.



Letchworth (Bat) retired owing to a broken frame.

The only absentees at one a.m. were Letchworth, Kerr, Southcomb May, Nott, Cass, and Keiller.

Mr. and Mrs. J. Chater Lea in the 8 h.p. Chater Lea cyclecar which attracted much attention all along the route.

CURRENT CHAT

TIME TO LIGHT LAMPS.

,, 3rd	... ...	9.6 ,,
,, 5th	.. ...	9.8 ,,

A.C.U. and the Grand Prix.

Special arrangements are being made by the A.C.U. for those members who wish to see the Grand Prix race. Additional interest is lent this year by the unusual number of English entries.

R.A.C. and Ascot.

There should be adequate provision for motorists attending this year's meeting at Ascot (from June 18th to 21st). All six motor enclosures have been secured by the R.A.C. This is the first time that self-propelled vehicles have been allowed inside the course.

Canadian Motor Cyclists' Association.

An association has been formed in Canada on the lines of the Federated Association of Motor Cyclists in the United States. The new body will be known as the Canadian Motor Cyclists' Association, and an agreement will be drawn up and signed with the F.A.M. to enable Canadians to ride at F.A.M. meetings and American riders to race in Canada. The first annual championship will be held on the Hamilton Jockey Club's track.

Road Dangers at Night.

Motor cyclists riding by night from Crowle to Gainsborough *viâ* Epworth should be careful of the ferry at Walkereth. The signpost on the main road reads "To Gainsborough," but Mr. Cave (who travels by motor in the interests of the Turco Co.) suggests that it should read "To Walkereth Ferry," as he recently found himself within a yard or so of the water's edge, there being no signpost to indicate that there was a ferry anywhere in the neighbourhood.

M.C.C. Inter-team Trial.

The complete list of clubs which have promised entries for the M.C.C. inter-team Trial for *The Motor Cycle* Cup to be held on June 15th, at Daventry, is as under: Bedfordshire and District M.C.C., Birmingham M.C.C., Bristol M.C.C., Bristol C. and M.C., Derby and District M.C.C., Derbyshire and North Staffs A.C., Coventry and Warwickshire M.C., Essex M.C., Herts County M.C.C., Liverpool M.C.C., Luton and South Beds. M.C.C., Mersey M.C., Motor Cycling Club, Northants M.C.C., Norwich and District M.C.C., Norfolk M.C.C., North-west London M.C.C., Nottingham and District M.C.C., North Middlesex M.C.C., Oxford M.C.C., South Birmingham M.C.C., South-east London M.C.C., Sheffield and Hallamshire M.C.C., Sutton Coldfield and Mid-Warwickshire A.C., Walthamstow M.C., and Wolverhampton M.C.C.

Grand Prix de Champagne.

The Touring Motoclub de France rejoices in having secured several English entries for its Grand Prix de Champagne, which takes place on June 2nd. In Class 1. Berwick will ride a 2¾ h.p. New Hudson and H. Graham Dixon a 3½ h.p., while R. G. Mundy will ride a 3½ h.p. Singer and J. Cocker a 2½ h.p. Singer.

Speed Limit Applications.

The application by the London County Council for a ten-mile speed limit at the road junction at Swiss Cottage has been refused. The A.C.U. and A.A. and M.U. were represented at the inquiry.

SPECIAL FEATURES.

MY MOST EXCITING RIDE.
LONDON-EDINBURGH RUN.
PETROL CONSUMPTION.
BIRMINGHAM-LAND'S END-BIRMINGHAM

The Scottish Auto Cycle Union.

Already the Scottish A.C.U. represents some seven hundred motor cyclists, and its future seems assured. The following have been elected as a General Committee: Messrs. Norman Macmillan, C. H. Macmillan, Campbell McGregor, R. J. Good, J. R. Alexander, William Morrison, J. D. Morrison, J. S. Fulton, George H. Cutbush, John Gow, Alex. R. Fraser, F. Salvesen, T. R. Marshall, R. W. C. Stevens, John R. Thomson, G. E. Whitehouse, W. Yeaman, J. R. Nisbet, jun., D. C. Paterson, A. L. Watt, Bruce Syme, J. Craig, jun., Simon McLean, A. F. Sinclair, D. S. Baddeley, and R. J. Smith. Mr. James S. Fulton, 151, West Regent Street, Glasgow, has been appointed secretary, and the Marquis of Tullibardine is to be asked to accept the presidency. In view of the good work done by Messrs. Norman Macmillan, John Gow, and John Adam, chairmen of the Edinburgh, Glasgow, and Scottish Automobile Clubs respectively, the first-mentioned has been appointed chairman of General Committee, the second vice-chairman, and Mr. Adam a vice-president in the company of Messrs. Robert Todd and J. R Nisbet.

INTER-'VARSITY HILL-CLIMB.
A. C. Hardy, Oxford (4 h.p. Norton), about to cross the finishing tape. (See pages 582-583.)

BIRMINGHAM—LAND'S END—BIRMINGHAM COMPETITORS.
A group of competitors in the Birmingham M.C.C. run to Land's End and back assembled at the Land's End on Sunday.

English-Dutch Reliability Trial

Next week we hope to publish the list of British representatives in the international contest to be held in Holland on August Bank Holiday. Over a score of club committees have assisted in the selection of the British teams.

British Successes in France.

At the two-day Meeting Automobile du Mans, organised by the Automobile Club de la Sarthe et de l'Ouest, British machines scored heavily. On the first day the results were :

Up to 500 c.c.—1, R. G. Mundy (Singer), 41⅕s. ; 2, H. G. Dixon (New Hudson), 42s. ; 3, V. Taylor (3½ Rudge), 43s.

Up to 350 c.b.c.—1, H. G. Dixon (New Hudson) ; 2, J. Cocker (Singer) ; 3, Péan (Peugeot).

Sidecars, etc.—1, H. G. Dixon (New Hudson) ; 2, Bouville (Bedelia).

The result of the joint hill-climb was :

Lightweight and 500 c.c. Classes.—1, R. G. Mundy (Singer) ; 2, H. G. Dixon (New Hudson).

Sidecars.—H. G. Dixon (New Hudson).

FUTURE EVENTS

June 1.—Birmingham M.C.C. Open Hill-climb at Wenlock Edge.
1.—Liverpool A.C.C. Open Hill-climb.
1.—B.M.C.R.C. Race Meeting.
„ 14 and 15.—Dublin M.C.C. Open 24 Hours' Reliability Trial.
„ 15.—M.C.C. TEAM TRIAL.
„ 28.—JUNIOR TOURIST TROPHY RACE.
„ 29.—North Middlesex M.C.C. Open 12 Hours' Reliability Run.
„ 29.—Mersey M.C. Open Hill-climb.
July 1.—SENIOR TOURIST TROPHY RACE.

Unofficial Records.

At Penzance last week-end we were informed that a rider of a Quadrant was timed away from Land's End on Saturday evening in an attempt to capture the End-to-end record. The rider in question has already failed in an attempt to beat the lightweight record.

T.T. Entries.

Four more entries have been received for the Tourist Trophy : F. W. Owen (Norton), J. R. Hayes (K.S.), and N.S.U. Co. (one machine), senior ; N.S.U. Co. (one machine), junior. The N.S.U. machines will be ridden by Gassert, who rode last year in the Isle of Man.

Hill-climbing.

T. M. G. Chapman, of Cadewell, near Torquay, advises us that recently his 1912 pattern T.T. 3½ h.p. Arno, ridden by George Fleming, made a clean ascent of Stentiford's Hill, Torquay, from a standing start. The gear was carefully measured and found to be 5 to 1. The hill is 250 yards in length, with an average grade of 1 in 5.

Speed in Sevenoaks.

Many motor cyclists travel too fast on the London-Sevenoaks road in order to get up the hill on the London side of the village, and then forget to slow down on arrival in the village. An application for a ten-mile limit is contemplated, but the A.C.U. has managed to get the Kent County Council to withhold their application subject to an appeal being made to motor cyclists to moderate their speed. It is to be hoped riders will exercise caution, not only in Sevenoaks, but all towns and villages, and so prevent these complaints being made.

The Next Mobilisation Test.

There are still a large number of well-known motor cyclists who have not yet entered for the mobilisation test on Sunday, June 9th, which ought really to prove a most interesting event. Competitors should select routes which will avoid the greater towns. The object of the competition is apparently not quite clear to some people.

For those who have not followed the scheme of the competition it may be as well to repeat the conditions. All those who send in their applications will receive a postcard on Saturday, June 8th, telling them the rendezvous (which will be within fifty miles of Charing Cross). The time of arrival is fixed at 1 p.m. on June 9th, and competitors should time themselves so as to arrive on the stroke of the hour. All those who wish to take part should refer to the conditions on page 531 in the issue of May 16th last.

J. Cocker (Singer) competing in the hill climb at Le Mans on Sunday last. Singer machines were conspicuously successful at this important French meeting.

BIRMINGHAM-LAND'S END-BIRMINGHAM.

A Sporting Long Distance Trial for the Lycett Trophy.

THE second annual competition organised by the Birmingham M.C.C. for the Lycett trophy took place on Saturday and Monday last over the same course as last Whitsuntide, viz., to Land's End and back. Despite the arduous nature of the contest, each day's journey necessitating seventeen hours' riding, there were over forty entrants. The start was at 3 a.m. on Saturday last, from the Maypole, Alcester Road, the competitors having assembled half an hour or so earlier in order to have their numbers allotted and watches sealed. An interesting feature of this run was the adoption of the sealed watch for timing, which system, we believe, was first instituted by the Bradford M.C.C., of which club Mr. Vernon Brook, the Birmingham hon. sec., was at one time a prominent official. The competitor's sealed watch has effectually settled all disputes as to timing. At one period a competitor with a good watch would find that checkers' watches varied several minutes, and the wrong man was declared winner; but in the sealed watch system every competitor is timed from his own watch.

The silver tropny, value 30 guineas, presented by Mr. E. R. Lycett.

The air was crisp and cold as the first competitor set out on his long run with lamp burning brightly.

The Route.

The route was as follows: Alcester, Evesham, Cheltenham, Painswick, Stroud, Marlsworth, Old Sodbury, Bath, Shepton Mallet, Taunton, Cullompton, Exeter, Two Bridges, Tavistock, Callington, Liskeard, Lostwithiel, St. Austell, Truro, Redruth, Penzance, Land's End.

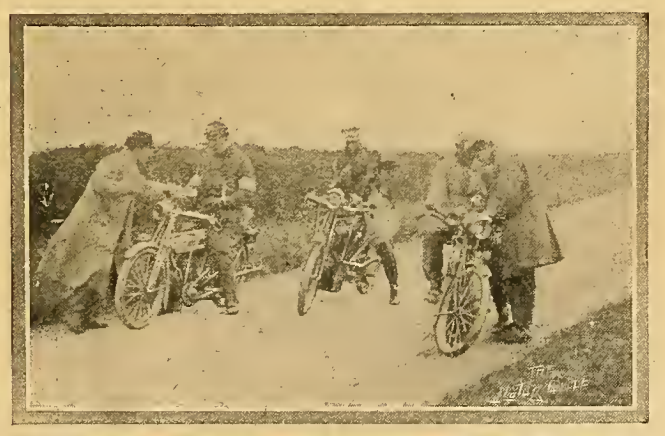
The first secret check proved to be approximately six miles south of Evesham, but so keen was the competition for the trophy that all were close to time. Most of the competitors ran most regularly, and, the first part of the journey being over familiar ground, little of incident occurred.

There was a fine pull up out of Bath, which was a foretaste of more to follow in Devon and Cornwall. Several were reported missing at this point. K. L. Spiers (Enfield sc.) and J. H. Slaughter (L.M.C. sc.) were notable absentees. Punctures were not infrequent, but generally the riders ran most regularly, which, indeed, was necessary if 20 m.p.h. was to be averaged. Outside Radstock we passed George Bell (New Hudson sc.) repairing a puncture. A 3d. toll at Burr Bridge gave the stragglers an opportunity to catch up and chat over the events during early morning.

Performances of the 3½ h.p. Sidecars.

Quite a feature of the run was the wonderfully consistent running of some of the 3½ h.p. sidecar machines. In spite of the numerous hills and severe nature of the conditions, splendid progress was made, and several reported absolute non-stops. A. D. Arter's James, for instance, was never once seen stopped, and the way his three-speeder annihilated the Devonshire gradients, often on the intermediate ratio, won universal praise. S. Wright and B. Yates were also plodding along in regular style on their 3½ h.p. Humber sidecars. The former started at 12.45 a.m. from Coventry, and started in the competition at 3.2, so he had prolonged his journey unnecessarily.

Bourke (New Hudson) reported to the writer that he never had occasion to open his toolbag on the outward run. P. J. Evans was driving a 6 h.p. Enfield, with his wife in the sidecar. We had a number of chances to observe its speed, and we noted particularly that he had no difficulty at all in keeping pace with the bicycles. Two new twin A.J.S. machines attracted attention by reason of their silence and smooth running, whilst Fowler's Norton with Shelley gear was always amongst the leaders.



The first arranged stop was at the Bude Hotel, Exeter, for lunch (164 miles). Thereafter the course became much more severe, and single figure gradients were frequent.

To make matters worse, the road is narrow and winding, and one who is unacquainted with the road has little idea when a long hill is being encountered. The second secret check was approximately five and a half miles from Tavistock, but here again most were on time. Over Dartmoor the hills were steeper than ever, and many a time the riders were passed cooling their engines. T. Pollock (James) was geared too highly, and twice he ran to the foot of a hill for a second attempt. Dr. Fawssett (Chater-Lea sc.) was passed repairing a puncture, and he was not seen again until the Sunday, when he turned up at Land's End. Sand Hill, Gunnislake, an ascent nearly two miles long, tested the engines severely. We noticed McNab (Trump) come to a standstill, and have no doubt others did the same. R. W. Duke (Zenith) broke a valve, and lost three-quarters of an hour removing the cap. He later burst a tyre in Hayle, but caught up again.

In Penzance, Mr. Edward Lycett, the donor of the trophy, was awaiting the arrival of the competitors. What a temptation it must have been for them to stop, instead of continuing to Land's End and back—another twenty miles. As usually happens on these trials, two were unlucky on this last stage. Blackwell (Zenith) burst a cover and could not continue, whilst Spiers (Macbeth) broke the carburetter control wire and had to stay at the End. A goodly crowd assembled at Holman's Garage to witness the finish of Saturday's run. Those who checked in were:

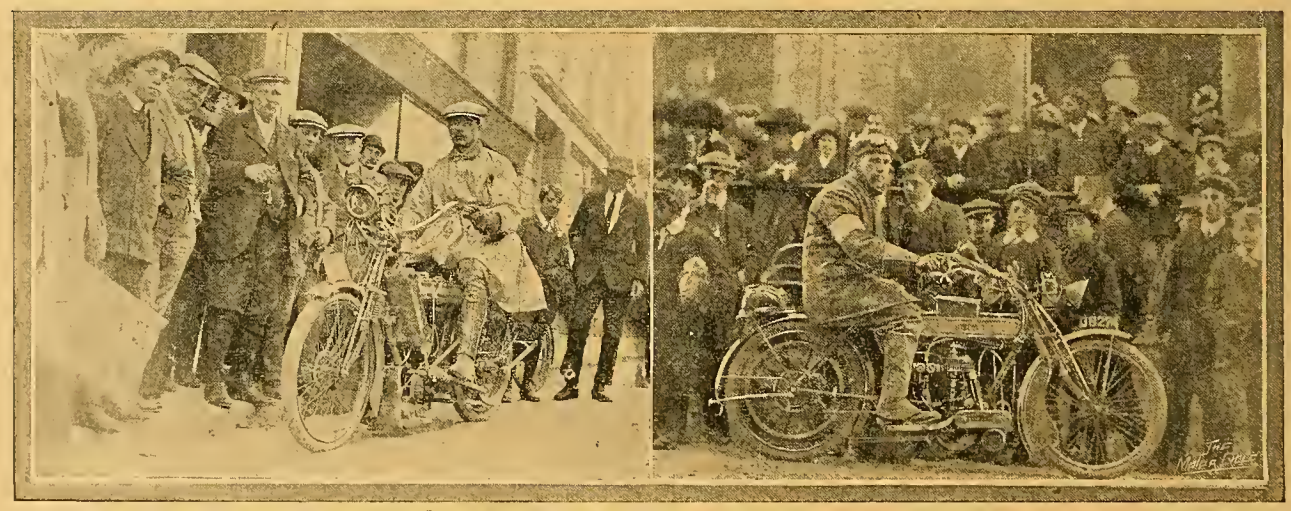
Entrant, machine, and gear.	*Entrant, machine, and gear.*
R. V. C. Brook (3½ Precision—Roc)	J. H. Percox (3½ Alldays)
H. R. Fowler (3½ Norton—Shelley)	L. Newey (3½ Ariel—Armstrong)
F. Read (2½ A.J.S.—A.J.S.)	F. C. Sangster (3½ Ariel)
R. W. Duke (Zenith—Gradua)	H. Walters (2½ A.J.S.—A.J.S.)
H. Stevens (5 A.J.S.—A.J.S.)	A. J. Stevens (2½ A.J.S.—A.J.S.)
W. E. Baylis (3½ N. Hudson—Armstrong)	H. Ball (3½ Triumph)
H. D. Jones (3½ Zenith—Gradua)	T. E. Blumfield (3½ Kerry—Armstrong)
P. J. Evans (6 Enfield—Enfield)	S. Wright (3½ Humber—Roc)
T. Peck (3½ Rudge—single)	B. Bourke (3½ Humber sc.—Armstrong)
H. Blockside (3½ B.S.A.—single)	B. Yates (3½ Humber sc.—Roc)
T. Pollock (3½ James)	G. Bell (3½ N. Hudson sc.—Armstrong)
A. Young (3½ Kerry—Armstrong)	H. J. Cox (3½ Premier sc.—Armstrong)
A. D. Arter (3½ James—Heron)	
F. A. McNab (3½ Trump—Armstrong)	
D. Cork (5 A.J.S.—A.J.S.)	

J. L. Norton (Norton sc.) experienced tyre trouble, so elected to stay at Penzance, as also did P. Brewster on a similar turnout.

At the secret check on the Evesham-Cheltenham Road in the early hours of Saturday.

The Return Journey.

All got away to time in the early hours on Whit-Monday, it being just sufficiently light to enable the riders to dispense with lamps. The hills on the homeward run were even more severe than going out, Lostwithiel, Gunnislake, Redruth, and Tavistock all boasting gradients of the first water. Over Dartmoor again one or two mounds proved real teasers. Sangster and Newey, on Ariels, kept together throughout, and always seemed ahead of time. H. J. Cox (Premier sc.) suffered belt troubles, whilst a number were noticed repairing or changing inner tubes. Cork (A.J.S.) somehow missed the first check between Liskeard and Tavistock—hard lines indeed, as he had kept closely to time throughout. The right-angled bend at Two Bridges successfully climbed, a long pull of over a mile on the edge of Dartmoor was the next rise to command attention. Here Mr. Lycett's car party were observing the riders. Near Moreton Hampstead Secretary Brook unfortunately landed in a ditch in rounding a bend downhill, and bent his forks besides damaging his machine in other ways. He pluckily continued and reached Exeter. After breakfast here, the competitors set out with light hearts *viâ* Taunton and Bath, the weather conditions being of the best and more familiar roads being at hand.



Dust troubled the riders not a little, and they presented a weird sight as they filed through the big towns. Most scurried ahead in order to snatch a hasty lunch in the neighbourhood of Stroud and Cheltenham, as no further stop was arranged. The last secret check was midway between the last-mentioned town and Evesham, and then the remaining section *viâ* Alcester was a mere nothing. P. J. Evans had time to watch with us the finish of a boat race at the Evesham Regatta.

The first man was due at Birmingham at 7.46, and almost to the minute he finished, followed by the remainder as under:

R. V. C. Brook (3½ w.c. Precision)
N. C. Blackwell (6 Zenith)
H. Rem Fowler (3½ Norton)
H. D. Jones (3½ Zenith)
R. W. Duke (3½ Zenith)
W. E. Baylis (3½ New Hudson)
F. A. McNab (3½ Trump)
H. Stevens (5 A.J.S.)
F. Read (2½ A.J.S.)
H. Walters (2½ A.J.S.)
D. Cork (5 A.J.S.)
A. J. Stevens (2½ A.J.S.)
J. H. Percox (3½ Alldays)
L. Newey (3½ Ariel)
F. C. Sangster (3½ Ariel)
H. Ball (3½ Triumph)
T. E. Blumfield (3½ Kerry-Abingdon)
A. Yonng (3½ Kerry-Abingdon)
H. Blocksidge (3½ B.S.A.)
Tom Peck (3½ Rudge)
T. Pollock (3½ James)
A. D. Arter (3½ James sc.)
Dr. B. Fawsett (8 Chater-Lea sc.)
P. J. Evans (6 Enfield sc.)
H. J. Cox (3½ Premier sc.)
Sam Wright (3½ Humber sc.)
B. Bourke (3½ New Hudson sc.)

The Lycett Trophy winner cannot be announced until next week.

The run throughout was well arranged; excellent route cards with times and distances clearly marked were supplied to each competitor, and despite the gruelling nature of such a long ride over roads varying from almost flat to exceptionally difficult, the competition was greatly enjoyed by the participants.

(1) The first arrivals at Holman's Garage Penzance. R. Vernon C. Brook on the 3½ h.p. water-cooled Precision. (2) H. Rem Fowler (3½ h.p. Norton), with Shelley gear, who rode most regularly throughout.

THE LEGION OF MOTOR CYCLISTS.

THE HON. SECRETARY'S REPLY TO A RECENT ATTACK.

Sir,—My attention has been called to an editorial in a contemporary, reprinted *in extenso* by a twin journal, and headed "Advice to the Legion of Cyclists." I do not know on what grounds the writer of the article assumes the right to give advice to the members of an organisation to which he himself does not even belong. As hon. organising secretary of the Legion, I would like to advise him to mind his own business, and, in the eloquent words of the *Titanic's* operator, "To keep out, you fool."

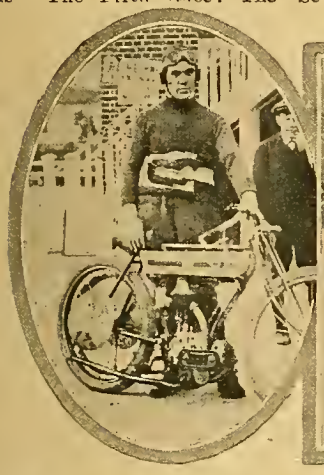
He justifies his presumption by pleading that, owing to the War Office refusal to recognise the Legion, "it is obviously futile to proceed with the Legion," and advises his readers not to waste any more time upon a scheme that he himself claims to have started.

I would like to point out that, first of all, your contemporary did not start the scheme. The Legion was started by myself and certain enthusiasts on military cycling. In December I asked the editor of *Cycling* to lend it the publicity of his pages, and two months later the editor of your contemporary offered also to publish details—a request with which I complied. So much for the boastful claim as to originating the scheme.

Now I should like to say a word as to the weak-kneed advice the editor has now presumed to give to the Legion. At the very first rebuff from the War Office he throws up the sponge. That, sir, is not the way great causes win to their own. I myself have had some little hand in gaining recognition of the value of military cyclists in general. It has been an uphill battle lasting many years, and we certainly should not now possess fourteen regiments of cyclists in the Territorial Army if those who have worked so hard for the cause had thrown up the sponge at the first rebuff. Whether I shall win recognition for the Legion eventually I cannot say, but I shall not cease to fight for it by every means in my power so long as a dozen loyal legionaries will stand by me. At present I am receiving splendid support. Thirty new corps have been formed during the past month, and I have received many loyal protestations from organising officers throughout the country, who are anxious to stand by me.

Arrangements have been made for publishing an illustrated monthly, in which several pages will be devoted to Legion news. This journal will make its bow to the public on June 15th, and is entitled *The Territorial Monthly and Legion News* (price 2d.), with editorial offices at 128, Jermyn Street, W. That very small public which may have seen the editorial article in your contemporary are requested to get the first issue and read the other side of the case. A. H. TRAPMANN, Captain
(Hon. Sec. L.O.C.)

MOTOR CYCLE RACING AT BROOKLANDS.

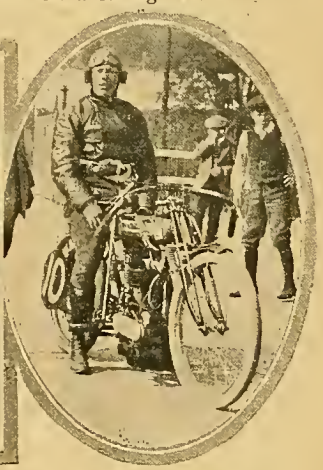


FINE weather favoured the Brooklands race meeting on Whit-Monday. The attendance was excellent and the races were well supported. The first motor cycle race was the eighth short motor cycle handicap, distance about 5¾ miles (for start). The machines passed the fork once and then entered the straight. All got away well except Remington, whose machine was slow starting. He eventually got up a good speed, when his belt came off. The order at the fork at the end of the first lap was: Edmond, Dewar, Kickham, Stanley, Jepson, Campbell, Lavender, Walker, Barnes, Fowler, Friedlander, Bailey, Axford, Elce, Capt. Harkness, Printz, and Weatherilt. The race resulted in an easy win for Dewar who led by about quarter of a mile.

		Handicap.
1.	W. Dewar (1 Triumph, 85×88) ...	... 1 42
2.	M. Campbell (1 Triumph, 85×88) ...	... 1 26
3.	G. E. Stanley (1 Singer, 85×88) ...	... 1 30

The next motor cycle event was down on the programme as "The Fifth Race: The Seventh Long Motor Cycle Handicap." Distance, about 8½ miles. The machines passed the fork twice, and then entered the straight. The first lap order was Edmond, Kickham, Jepson, Davis, Campbell, Lavender, Manners-Smith, Friedlander, Dewar, Winfield-Smith, Bailey, Fowler, Capt. Harkness, Weatherilt, Axford, Stanley, Elce, Printz, Schmidt, Barnes, and Remington. Second lap order: Edmond, Kickham, Campbell, Jepson, Weatherilt, Fowler, Lavender, Winfield-Smith, Dewar, Manners-Smith, Stanley, Friedlander, Axford, Bailey, Printz, Elce, Capt. Harkness, Remington, Barnes, and Schmidt. Weatherilt won easily.

		Handicap.
1.	P. Weatherilt (1 Zenith, 90×77.5)	... 1 24
2.	M. Campbell (1 Triumph, 85×88)	... 2 9
3.	E. Kickham (2 Douglas, 60×60) ...	... 2 45



The winner's speed was 65¼ m.p.h. Campbell, who is a keen private owner, was, it will be noticed, second in both races; he also competed on a racing car.

(1) W. Dewar (3½ h.p. Triumph), winner of the eighth Short Handicap.

(2) A fine finish.

(3) P. Weatherilt (Zenith), winner of the seventh Long Handicap.

DUBLIN TO LISBURN AND BACK.

THE Whitsuntide fixture of the Dublin and District Motor Cycle Club took the form of a reliability trial from Dublin to Lisburn and back, a distance of 186 miles. The start took place from Drumcondra Bridge at 9 a.m. The White Cup was offered in the event. The single-cylinder machines were compelled to carry a lady passenger, and in both classes the combined weight of the passenger and driver was fixed at 17 stones. There were two controls on each journey, at Dunleer and Banbridge, and at the turning point, while two or more secret controls were stipulated for. The starters were as follows:

WHITE CUP COMPETITION.

T. J. Dunphy (7 Indian)	C. Magennis (3½ Rudge)
F. Keogh (3½ Triumph)	F. J. Walker (3½ Rudge)
H. T. Carroll (3½ Rex)	R. Lowry (3½ Rover)
C. E. Murphy (3½ Triumph)	J. P. Quill (2¾ Douglas)
T. E. Greene (3½ Rudge)	R. Walshe (4 Calthorpe)
J. H. Taylor (3½ Rudge)	T. Woods (3½ Premier)
J. Browne (3½ New Hudson)	A. F. Irwin (2¾ Enfield)
P. J. Brady (3½ Rudge)	W. G. Green (2½ A.J.S.)
G. Roche (3½ Rover)	P. Beattie (3½ Rudge)

SIDECAR CLASSES.

A.—Single-cylinders.	B.—Multi-cylinders.
T. D. Rolling (3½ Rover sc.)	J. L. Walshe (6 Enfield sc.)
E. W. Armstrong (3½ Rudge)	F. A. Wallen (6 Enfield sc.)
V. Barton (3½ Triumph sc.)	J. D. Weir (7 Indian sc.)
O. G. Price (3½ Rudge sc.)	T. A. Ireland (7 Indian sc.)
J. Healy (3½ Rudge sc.)	O. S. Baker (6 Enfield sc.)
W. J. Towell (3½ Rudge sc.)	

The feature of the trial was the remarkably high standard of reliability attained at all open controls. The great majority were dead on time, and at the finish only three men varied from the schedule. Consequently the result will altogether depend on the markings at secret controls, and will not be known until these are examined.

LONDON—COVENTRY TRIAL RESULTS.

The following prizes were awarded in the above trial. The figures represent the total number of marks lost by each competitor.

MEMBERS' CLASS.

J. H. Pooley (3½ h.p. Premier), 0; silver cup and special prize for best solo performance.

SILVER CUPS.—W. Cooper (3½ h.p. Bradbury), 1; G. H. Hollis (2¾ h.p. Douglas), 1; H. Karslake (3½ h.p. Rover), 1; H. Beau (6 h.p. Matchless), 2; L. Joiner (3½ h.p. Brown), 3; E. Rose (3½ h.p. P. and M.), 3; and P. C. Dewhurst (3½ h.p. Rudge), 4.

SILVER MEDALS.—J. Gibbs (2¾ h.p. Humber), 10; G. B. Coombes (7 h.p. Indian), 13; E. G. Westacott (3½ h.p. Zenith), 16; and P. H. Goddard (2¾ h.p. Douglas), 21.

OPEN CLASS.

C. R. Collier (8 h.p. Matchless and sc.), 1; H. A. Collier (8 h.p. Matchless and sc.), 2; R. E. Guest (8 h.p. Matchless and sc.), 4; J. Tassell (8 h.p Matchless and sc.), 4; silver cups and Woolwich, Plumstead and District team winners of team cup and silver medals.

J. R. Haswell (3½ h.p. Triumph sc.), 3; silver cup and special prize for best member's performance in Open Class.

SILVER CUPS.—A. C. Robbins (3½ h.p. Humber sc.), 3; J. T. Wood (G.W.K.), 4; G. M. Killier (G.W.K.), 4; J. Oliphant (3½ h.p. Premier sc.), 4; H. W. Lambert (8 h.p. Chater-Lea sc.), 1; H. F. S. Morgan (8 h.p. Morgan), 1; F. S. Wheatland (6 h.p. Matchless sc.), 3; F. Smith (5-6 h.p. Clyno), 4; C. T. Newsome (3½ h.p. Rover sc.), 5; and R. G. Mundy (4 h.p. Singer sc.), 10.

SILVER MEDALS.—S. Tessier (6 h.p. Bat and sc.), 8; A. J. Dixon (4 Singer sc.), 13; W. O. Oldman (6 h.p. Bat and sc.), 16; F. Hill (A.C. Sociable), 13; A. S. Phillips (8 h.p. V.S.-Jap and sc.), 15; F. J. Willmott (8 h.p. Morgan), 17; W. S. Percival (3½ h.p. Humber sc.), 31; and W. P. Tippet (3½ h.p. Humber sc.), 27.

CLUB NEWS

Nelson and District M.C.

The first hill-climb will be held on June 1st on Thorny-holme Hill, about two miles from Nelson.

Hunslet M.C.C.

A motor cycle club is being formed under the above title. Information can be obtained from the hon. secretaries, Messrs. W. H. Gaines and T. Wasden.

Merioneth M.C.C.

The first competition of this new club took the form of a club run to Pentre Voelas. The hon. secretary is Mr. B. Edwards, Talrafon, Dolgelly.

Purley and District M.C.C.

Last Saturday's trial between a team of six Purley riders and six of the South-East London resulted in a win for the former by 592 marks to 457. Brasted and Titsey Hills had to be climbed twice on the run, the total distance being sixty miles.

Wishaw and District M.C.C.

A hill-climb was held at Kirkfieldbank on the 18th inst. Results :

Lightweight Class.—1, G. Brown (Douglas); 2, A. McLean (2¼ F.N.).

Touring Class.—1, J. L. Muir (Triumph); 2, J. Buchanan (Bradbury).

The above club will hold a confined reliability trial on Saturday, June 1st. The distance is about 130 miles, and the route chosen is a very good one for such a trial.

Newcastle and District M.C.

The above club held their annual all night reliability trial on the 18th and 19th inst., the first competitor leaving the club house in Saville Place at 9 p.m.

The outward route chosen was *viâ* Berwick and Dunbar, returning home by way of St. Boswell's and Jedburgh.

Fourteen competitors started, and of this number five qualified for silver medals and one for the club bronze medal.

The names of those qualifying for silver medals are as follows: J. E. Reed, J. Cooper, R. J. Spencer, W. S. C. Spencer, and R. Wilson; bronze medal, W. S. Doods.

Northamptonshire M.C.C.

The prize-winners of the flexibility hill-climbing competition held on Doddington Hill on the 18th inst. were as follows :

Class I.—Single-cylinder Machines.

		Difference in time.
1.	W. Lees (T.T. Triumph)	2m. 13s.
2.	C. T. Underwood (3½ Bradbury) ...	2m. 5⅘s.

Class II.—Any Type of Machine.

1.	C. T. Underwood (3½ Bradbury) ...	2m. 24s.
2.	W. Lees (T.T. Triumph)	2m. 14⅕s.

The Triumph Cup, which was the prize for the first class, now becomes the property of Mr. Lees, who has won it twice in succession.

Dundee and District M.C.C.

The above club held a successful hill-climb, the results being decided on formula.

Lightweight machines, single-cylinder: 1, Miss Kate Scott (2½ Singer); 2, W. Bell (2½ ———); 3, John Thomson (2¾ Minerva).

Twin-cylinder machines: 1, Miss J. Couttie (2¾ Douglas); 2, G. E. Whitehouse (2¾ Douglas); 3, Dr. A. P. Low (2¾ Douglas).

Heavyweight machines, single-cylinder: 1, J. W. Adamson (3½ Triumph); 2, W. P. McArthur (3½ Triumph); 3, J. S. Beveridge (3½ Triumph).

Heavyweight machines, multi-cylinder: 1, D. G. Forrester (5-6 J.A.P.); 2, S. J. K. Thomson (7-8 Bat); 3, A. S. Morgan (7 Indian).

Passenger machines: 1, E. Robertson (3½ Rudge sc.); 2, S. J. K. Thomson (9 Bat sc.); 3, H. M. Lowson (3½ Triumph sc.).

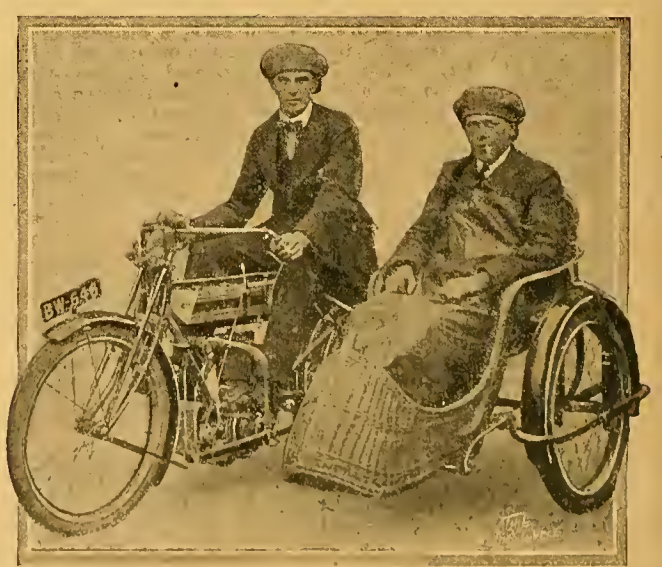
North-west London M.C.C.

The second competition for the Thomas Challenge Cup will take place on Saturday, June 8th, starting from Finchley Road at 6.30. It will take the form of a reliability run of about 216 miles, with probably eight time checks, and competitors will lose marks for failure on nine observed hills, including Dashwood, Kingston, Bhrint Kop, and Sundon.

Aberdeen and District M.C.C.

A flexibility trial was carried out on the Slug Road on the 18th inst. It had been originally intended to have a hill-climb at the Shooting Greens, but owing to the road there being under repair the flexibility event was taken instead. There was a large turn-out of members, and nineteen entered for the competition. The winners were: 1, J. A. Wood, jun., 4.81; 2, A. Stewart, 4.75; 3, G. F. Davie, 4.72; 4, H. Cassie, 4.10.

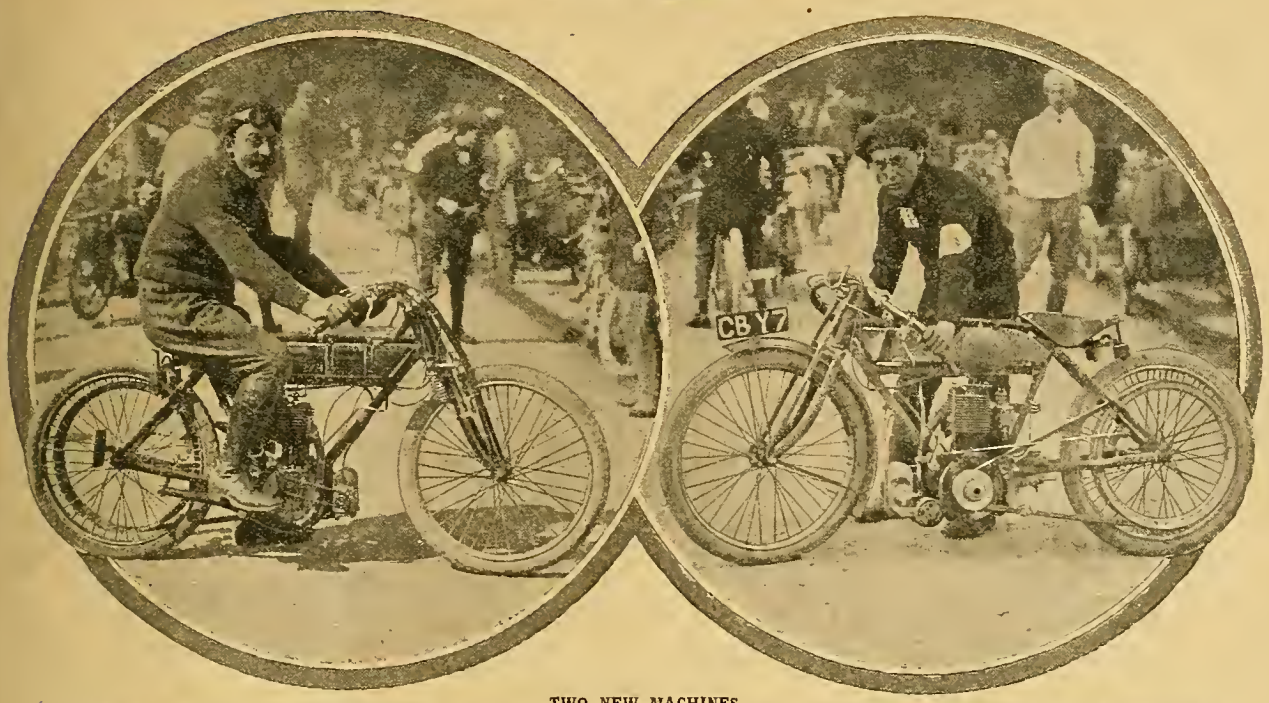
Mersey M.C.



A Tortoise Race will take place on June 1st. Members meet at the Shrewsbury Arms, Old Chester Road, at 3 p.m.

Team trials will be held on June 2nd, meeting at the Farmers' Arms, Moreton, at 2.30 p.m.

Ayr and District M.C.



A flexibility hill-climb was held on the Asylum Brae, near Ayr, on the 22nd inst. The results, based on the formula $\frac{\text{Slow} - \text{Fast}}{\text{Fast} + \text{Slow}}$ were as follows :

		Fig. of Merit.
	Open Class.	
1.	Jas. Gilchrist (3½ Triumph)	.614
2.	Jas. Senior (3½ Rudge)	.605
3.	D. McGill (3½ Mystery II.)	.600
	Amateur Class.	
1.	Jas. Gilchrist (3½ Triumph)	.633
2.	Jas. Senior (3½ Rudge)	.584
3.	W. Munro (2¾ Douglas)	.540
	Novices' Class.	
1.	J. McKervail (3½ Triumph)	.568
2.	A. Reeve (3½ Rudge)	.549
3.	Jas. Purdon (Peugeot)	.394

186 MILES TO THE GALLON.

H. S. Askew (3½ h.p. Triumph sidecar) who is credited with covering such a big distance per gallon of petrol, in the Oxford M.C.C. consumption contest, that the manufacturers of the machine find it difficult to believe. We have suggested to the Oxford M.C.C. that the trial be repeated.

TWO NEW MACHINES.

C. Thackray and the 3½ h.p. Contrast-Jap on which he competed for the Ilkley M.C.C.'s Dawson Trophy.

H. Hodkinson (3½ Premo-Precision), on which he competed in the Bradford M.C.C. Leathley Bank hill-climb.

Evesham M.C.

At a meeting held in the Public Hall, Evesham, on the 14th inst., it was resolved to form a club for the district. Mr. W. H. Chapman was appointed captain and Mr. E. Holloway hon. secretary *pro tem.*

Kidderminster M.C.C.

This new club held its opening competition in the form of a hill-climb on the 11th inst., at Copthorne Hill, near Bridgnorth. The races were run on the knock-out plan. Result: 1, F. Wright (Ivy-Precision); 2, Cedric A. Nicholls (Triumph); 3, F. W. Giles (Clyno).

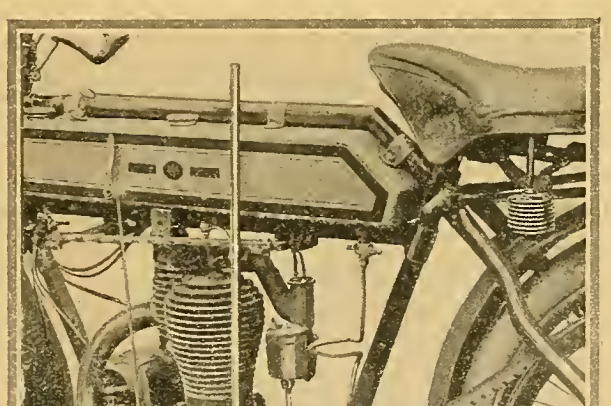
Walthamstow M.C.

The club's standard ride to Norwich and back resulted as follows: Miss A. Percy (3¾ Scott and sc.), J. W. Percival (6 Fafnir tricar), A. G. Peppercorn (3½ Bradbury), F. Picken (3½ Rudge), H. Eiden (5 F.N.), and H. J. Beal (3½ N.S.U.), all of whom received silver cups.

Exeter and District M.C.C.

A reliability trial for the Hancock cup will take place on June 14th and 15th. The route will be round the coast of Devon and Cornwall, starting in a south-westerly direction from Exeter *viâ* Torquay, Totnes, Plymouth, Tavistock, Lostwithiel, Helston, Penzance, Wadebridge, Bude, Bideford, Lynton, Minehead, Tiverton, Sidmouth, and Exeter. No stops (except traffic) will be allowed between controls. The total distance is 400 miles, and the schedule speed 20 m.p.h.

Sydney (N.S.W.) M.C.C.



The following entries were received for this club's reliability trial to Orange from Sydney on the 5th ult.: E. Fletcher, F. Flew, W. Spearing, C. Wellesley, A. Foy, R. Carlile, T. W. Green, R. W. Allen, A. Brown, D. St. Clair, A. Lawson, E. Fyson, A. Shilling, G. Hungerford, P. Bayley, R. Robinson, F. Staples, T. E. Green, F. H. Bartlett, H. I. Clements, and E. N. Birks.

The conditions were: Speed, eighteen miles per hour, and the trial to be an absolute non-stop one.

The distance from Sydney to Orange is 165 miles, and R. W. Allen (3½ Zenith) and P. Bayley (3½ N.S.U.) arrived at each of the four controls right to time. Both men had one dismount each, thereby tying for first place. The roads were fairly good, with the exception of part of that between Bathurst and Orange, the sand here being responsible for the downfall of many of the fixed gear machines.

Hamilton and District M.C.C.

A speed-judging competition was held on the 18th inst. over a four-mile course on the road between East Kilbride and Strathaven. Results: 1, Thomas Johnson, Hamilton (7 h.p. Indian), speed 25 m.p.h., 1s. early; 2, Robert Mack, Motherwell (5-6 h.p. Matchless), 15 m.p.h., 3s. early; 3, James Currie, Motherwell (3½ h.p. Chater-Lea-Jap), 20 m.p.h., 8s. late.

The above illustration shows the latest form of Mabon variable gear, which Mr. Mabon has adapted to a 3½ h.p. Rudge. The control, as will be seen by the photograph, has been greatly simplified, and can now be fitted to many well known makes of motor cycles. The gear, as shown, is only in the rough and is a prototype of future models. It was used by Mr. Mabon in the London-Edinburgh run.

Questions & Replies

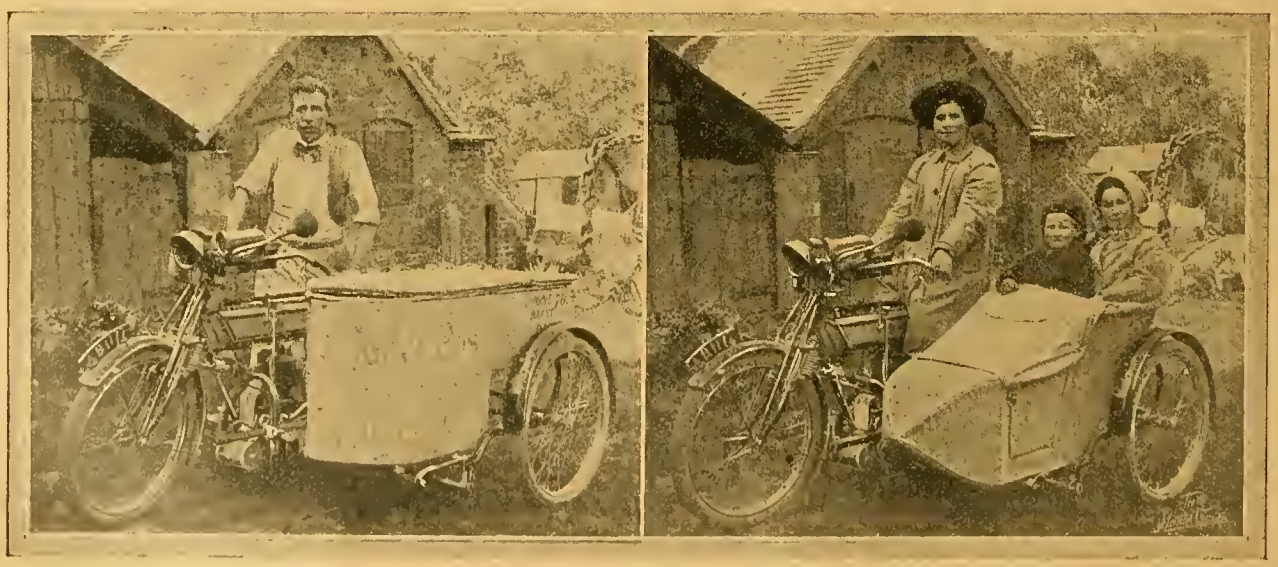
A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Hastings to Lampeter and Back.

I am contemplating a ride from Hastings to Lampeter in Cardiganshire this summer. Could you please inform me as to the most direct route, avoiding, if possible, any big towns or much traffic? I do not want to go anywhere near London, but I wish to stop at Gloucester.—A.G.M.

We have pleasure in giving you the following routes: Hastings, Pevensey, Lewes, Ditchling, Cowfold, Horsham, Cranleigh, Guildford, Bagshot, Camberley Crowthorne, Wokingham, Reading, Pangbourne, Streatley, Didcot, Wantage, Faringdon, Lechlade, Cirencester, down Birdlip to Gloucester, Ledbury, Hereford, Willersley, Hay, Three Cocks Junction, Brecon, Llandovery, and Lampeter. Hastings, Ninfield, Horsebridge, Lewes, Ditchling, West Grinstead, Billingshurst, Chiddingfold, Milford, Farnham, Odiham, Basingstoke, Newbury, Hungerford, Swindon, Cricklade, Cirencester, Gloucester, Ross, Monmouth, Abergavenny, Crickhowell, Brecon, Llandovery, and Lampeter. These routes avoid all the big towns. You can go one way and return by the other.

Ignition and Carburetter.



My machine is a 2¾ h.p. 1904 Humber chain-drive. It runs fairly well on the level, but will not take a hill, no matter how little. The valve and piston rings are all as bright as silver. The compression is very good. I might mention that the engine gets rather hot. I cannot get above forty miles to the gallon of petrol.—B.A.

From the description of your troubles we should say that your ignition timing is too late or that your carburetter is at fault. Take out plug in cylinder head and turn engine till piston is dead on top of compression stroke, then retard ignition lever two-thirds. If wipe contact is used, the segment should just be making contact; if make and break, the points should be on the point of breaking. A most important point in connection with hill-climbing on old pattern machines is the opening of the valves. Most probably you will find the exhaust cam worn and not raising the valve the full ¼in. If so, it should be replaced. The inlet valve should be adjusted to open ⅛in. to .5 in. Also try the effect of new valve springs.

Bushes and Magneto Repairs.

(1.) I have a Triumph 1909 free engine; what is the selling value of same? (2.) Will it take a sidecar easily? (3.) How should I proceed to give the engine new bearings, and what would be the cost of this? (4.) What parts of the magneto generally get worn first and want replacing? (5.) What are the bushes of an engine? (6.) How low should the gear be to enable the machine to take a well-loaded sidecar comfortably? (7.) Are the inlet and exhaust valves alike?—G.N.

(1.) The second-hand value of your machine is approximately £30. (2.) It would take a sidecar fairly well in a level district. (3.) You had better get the bearings rebushed by the makers, from whom the cost may be obtained. (4.) The contact breaker mechanism and the armature bearings. (5.) The bush is the stationary part of the bearing in which the journal (the moving part) turns. (6.) The machine should be geared about 5½ to 1 to take a sidecar, and with that it will not take a hill much steeper than 1 in 12. (7.) The valves are interchangeable.

A DOUBLE PURPOSE MOTOR CYCLE AND SIDECAR.

The photographs show how, by a simple conversion of bodywork, a 3½ h.p. Humber is made to do dual work in the capacity of a business and pleasure vehicle. The owner, W. Baseley, tells us that he has covered over 15,000 miles on his machine without trouble. He has climbed Mow Cop Hill, N. Staffs., with a 12-stone passenger in the sidecar.

Silencer.

(1.) The one feature I do not like about the 1912 3½ h.p. Rover motor cycle is its extraordinary silence. Would drilling larger holes in the silencer make it louder? (2.) On the above-mentioned machine there are two ways of starting. One is by running alongside the machine, and the other is by pedalling the machine on the stand and letting in the Triumph clutch with which it is fitted. I do not care for either of these methods of starting. Is it possible to employ a method of handle starting—something similar to the Phelon and Moore or Roc machines? If so, I shall be glad of your suggestion. (3.) How does a Tourist Trophy model differ from an ordinary motor cycle? (4.) Is the petrol consumption of an 86 × 96 mm. engine higher than an engine of 85 × 88 mm. bore and stroke?—W.R.D.

(1.) Drilling larger holes in the silencer would make it louder. Its silence is one of its greatest advantages. It is the noise of motor cycles which hampers their popularity to a large extent. (2.) We should strongly advise you to be content with the present method of starting. A handle is not satisfactory, as a rule, on motor cycle engines. The engine can be started by the pedal with the back wheel on the ground and the clutch out. (3.) A T.T. model is shorter and lighter than a touring machine and has no pedals; it usually has a high compression engine and rigid forks. (4.) The consumption of an 86 × 96 engine would be slightly higher than that of an 85 × 88.

Road Obstruction.

While travelling to Woodside Ferry, Birkenhead, at about ten miles an hour, along New Ferry Road, Port Sunlight, I noticed a lorry on one side and a bread van on the other—both at a standstill—with a space between just wide enough for my passage. The carter in charge of the lorry was standing between the two vehicles, but close up to the bread van, apparently talking to the driver of the van. I sounded my horn three times in order, as I thought, to attract his attention and then pass on between the van on the left side and the lorry on my right. The trouble arose when the lorry driver, having apparently finished his conversation, stepped right in my path, on his way back to his horse I suppose. I had anticipated this and slowed down to five miles per hour, but nevertheless I hit him, came off, and the machine fell and damaged lamp, footrests, horn, and plating. The damage is roughly 25s. to 30s. Have I a good claim, and if so, against the man or employer? How should I proceed?—K 5.

Our legal adviser writes as follows: "I have perused the letter from 'K 5' and would suggest if he has any remedy at all, it would be against the man himself and not against the employer. An employer is only liable for such acts as his servant does in the ordinary course of his employment, and that would not include stopping to talk to the driver of the van. As regards the law, it would certainly appear that the damage was caused through the man's negligence in stepping across from the bread van towards the lorry without looking round to see what was coming. Your correspondent seems to have done all that he ought to have done, and, provided the facts can be proved, I think he would have good prospects of recovering the 25s. The man will, of course, say that he did not hear the horn, and will probably be of opinion that the motor cycle was going much faster than your correspondent states. It would, therefore, be inadvisable for 'K 5' to commence an action unless he has one or two good witnesses who will support his view of the matter. As the amount involved is small, I suggest it would be best for 'K 5' to write to the man demanding payment of the money, and threatening proceedings, but if some offer is forthcoming, he had better accept it. If he brought an action, it would certainly be a novel one, and, therefore, attended with some risk, but personally, I feel that the ordinary principles of law apply, and that he ought to succeed if he prove the facts clearly."

THE MOTOR CYCLE
T.T. and Summer Number
THURSDAY,
June 27th, 1912.

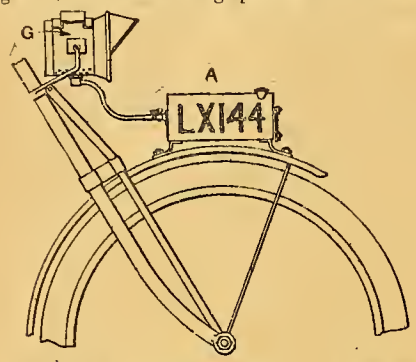
EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

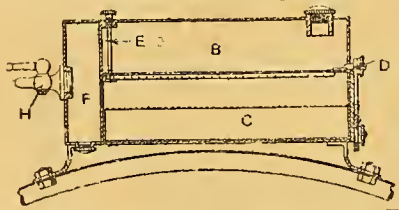
"A.C.B." (Windsor).—2½ h.p. two-stroke Levis. (1.) Speed obtainable. (2.) Lubrication. (3.) Wearing qualities of engine.

"F.O." (Weston-super-Mare).—3½ h.p. free engine Lincoln Elk with and without sidecar.

"W.H.J." (Notts).—2¾ h.p. twin-cylinder Humber with three-speed gear. Reliability, particularly engine.



BATTLING WITH THE ELEMENTS.

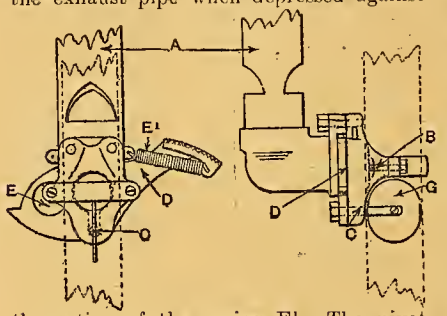


No matter whether north, south, east, or west, Miss Lottie Berend is usually to be seen at motor cycle functions. She and her lady passenger are oblivious as to the weather. In the photograph Miss Berend is seen battling against a gale of dust. She usually rides Precision engined machines, her best performance this year being in the Barnet-Harrogate and back trial.

A Combined Number Plate and Acetylene Generator.

An acetylene generator A is formed of inverted V-shape in cross-section, and is adapted to be secured to the front mudguard, its sides being painted with the

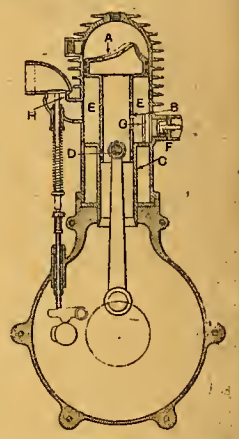
registration numbers. B is the water chamber, and C the carbide chamber, which is adapted to be slid longitudinally into position and secured by screws D.



The water control valve is shown at E, and the gas, when generated, passes to a chamber F, whence it issues to the lamp G by way of a tap H.—A. E. Bishop and F. Plater, No. 15,376, 1911.

PATENTS by Eric W. Walford A.C.I.P.A.

An Exhaust Whistle.



The whistle A is secured to the exhaust pipe by a clip B, which also carries a pivot C, upon which oscillates a plate D. This plate D is provided with a hole E adapted to put the exhaust whistle in communication with the exhaust pipe when depressed against

the action of the spring E¹. The pivot C also carries the butterfly throttle G, so that as the plate is moved to open the passage between the exhaust pipe and the whistle the butterfly throttle G is closed, causing the whole of the exhaust gas to pass through the whistle by means of the hole E.—W. W. Genn, No. 8,994, 1911.

A Two-stroke Engine.

This is a construction in which compression of the charge is not effected in the crank case but in a separate chamber provided for that purpose. The piston A is of two diameters, having a reduced portion B which passes down through a guide C and carries the gudgeon pin D. It will be seen that by this arrangement an annular space E is left beneath the piston head, and it is in this space that compression takes place, the gas being supplied through the inlet valve F. In the cylinder wall are formed ports G which, when the piston head aproaches the lower limit of its travel, allow the compressed gas to enter the combustion chamber, the exhaust gas meanwhile escaping through the cam operated valve H.—C. T. B. Sangster and W. Evans, No. 9,056, 1911.

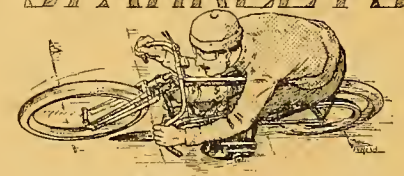
The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed.

T.T. Insurance Policies.

Special policies for the Tourist Trophy Race, including practice and the day of the race, are again being issued by Percy Butler and Co., 3, St. Peter's Square, Manchester.

The Circuit de l'Eure

In the above French race, which we described a fortnight ago, M. Plaudet, riding a standard two-speed Humber, secured the Triumph cup which was offered for the best time for four laps. Plaudet's time was 1h. 46m. 13⅘s.—12m. 21⅕s. faster than the second man.



Club Members' Performances.

The 2¾ h.p. Royal Enfield, with two-speed and free engine, has been very successful in members' club events of late. The firm point out that they have not entered their trade riders regularly in open events this year, but have relied more on the performances of private owners.

Trade Announcement.

The new garage recently built by Messrs. Patterson and Wilberforce, about a mile north of Caterham, combines utility and practicability with a pleasing appearance. It stands just off the main road, is approached by a short gravel drive, and is well equipped with waiting room, lavatories, and a good airy workshop fitted with electrically-driven machinery. The partners, Messrs. Cyril and Harold Patterson and Mr. Wilberforce, well-known motor cyclists, give the work their personal attention

SPARKLETS

Belt Fastener Improvement.

The latest Forward belt fastener, which has been so successful ever since its introduction, is now fitted with a serrated steel lining. The serrations grip the rubber of the belt and yet do not tear it.

Successes.

Outstanding victories at the Leathley Bank hill-climb must be credited to the Hutchinson tyre—which make, we believe, won every possible class—the Amac carburetter—which was also very prominent—and Lyso belts. F. W. Barnes, whose Zeniths scored so decisively, used the above.

A Metal-working Firm.

A firm making a speciality of motor cycle tanks, carrier boxes, spare petrol tins and radiators, is A. J. Phillips, 112, Lynton Road, Bermondsey, and 150 152, Southwark Park Road, S.E. The same firm also supply silencers and the Camber mudshield and under screen. The latter is stocked in standard sizes for Bradbury and Triumph machines, and can be supplied to fit other makes to order in two or three days.

Motor Cycle Insurance.

Motor cyclists contemplating insurance will find Harold Townend and Co., 13-14, Abchurch Lane, E.C., an old established firm which has been exclusively devoted since 1902 to the question of motor insurance.

Motor Cyclists' Guides.

Two useful books for motor cyclists are "Throup's North of England Guide" and the same publisher's "North Wales Guide." Both have been brought up-to-date, and may be obtained for 6d. each from all newsagents, or 7½d. each post free from T. Throup, 25, Whetley Hill, Bradford.

Catalogues Received.

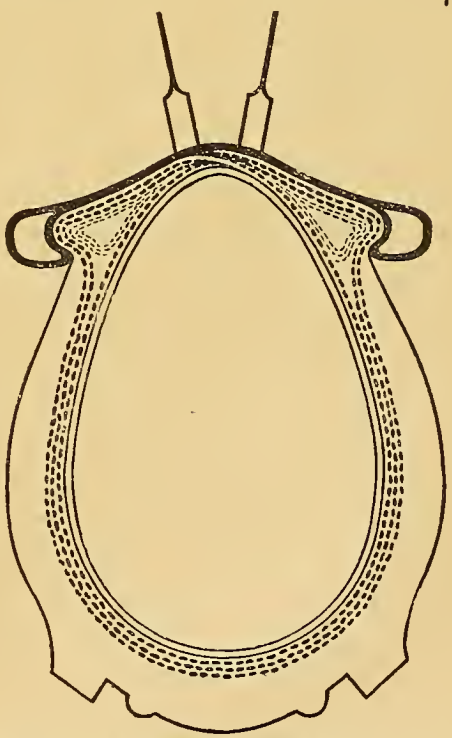
The latest catalogue of F.R.S. lamps and specialities is entitled "My Lamp." In this booklet are to be found descriptions and illustrations of the latest F.R.S. lamps, generators, back rests, and front wheel stands, which have attained such a wide vogue.

"Why? The Reason of Success"—a booklet proving by testimonials the reasons for the many successes enjoyed by Hutchinson tyres. Nearly every make of motor bicycle is mentioned, and opposite each is a testimonial from the owner of one of these giving his experiences. Tyres, goggles, and motor cyclists' overboots are also listed. The other publication is the company's motor cycle tyre catalogue, which enumerates the various types of these tyres now in use.

New non-skid principle.

Permanent non-skid quality is your protection against personal danger.
Until now all non-skid tyres wore smooth in time.
Every mile was run on the protecting ribs, studs, or other non-skid formation.

The non-skid device on



the New (1912)

"Bates" Tyre

is never in contact with the road except when the machine heels over to slip

Hence it is as effective on a tyre that has run for months as on a new tyre.

Note the tread-formation of "Bates" (1912) Tyres.

Heavy central tread takes all the weight.

Undercut side-ridges are off the road until the machine heels over to slip.

Then their sharp edges check the skid and save the rider.

See particulars, diagrams, and prices in the new (1912) Bates booklet "The Truth about Tyres."

TESTIMONIAL.

30, Upper Sandhurst Road,
Brislington,
BRISTOL.
March 27th, 1912.

Messrs. The Burnett Motor Tyre Co.,
Melksham, Wilts.

Dear Sirs,—It is with much pleasure that I express to you my satisfaction of excellent results I have had from one of your Special 3-ply Mdtor Cycle Tyres, which I purchased from you in 1910.

I fitted tyre to the rear wheel of my 4¼ h.p. single-cylinder motor cycle, sidecar attached, and ran about 3,000 miles without having the least bit of trouble, not even a puncture. I have since removed tyre to wheel of sidecar, and after 1,000 miles is still in excellent condition.

It is also interesting to note that during the time tyre was running on rear wheel of motor cycle, I used no less than three tyres of well-known makes on front wheel, which caused me no little inconvenience.

I may also add that I found tyre excellent as a non-skid during bad weather and far superior to any other make of tyre which I have ever tried.

Yours truly, W. H. WHITE.

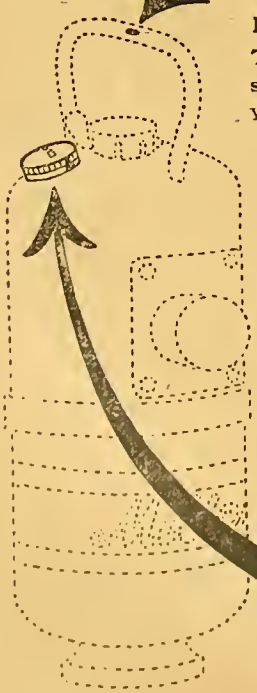
Rotax Accessories.

See those pointers—



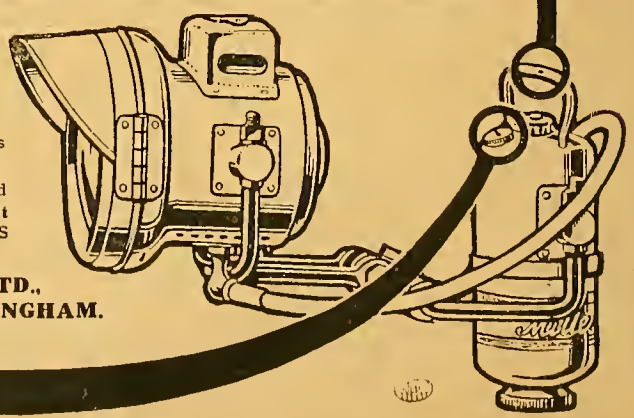
their purpose is to emphasise two exclusive features of the Miller Generator—the SOLID SCREW TO WATER-FEED and the HANDLE AIR-VENT—

These eliminate entirely the common fault of splashing, and, by such service, add enormously to the value of the MILLER models.

You know that fault—then you will appreciate the "remedy"—

It is to be found in all the Miller Motor Cycle Lamps, including the one illustrated here—the

MILLER 26S.



And, remember, that lamp has many other merits—among them—

A 4in. Mangin Lens Mirror, silvered by an entirely new process which renders its lustre absolutely heat-proof—less weight on the front door hinge than in any other head-light, thus entirely overcoming strain and the rattle which invariably ensues—a valve that is practically unbreakable and cannot be strained.

All this means better service, and—that's your need!

Then write us for the Miller Catologue, and note that all Agents can supply—**and that promptly**—and that the price of the 26 S (as illustrated) is **35s.**

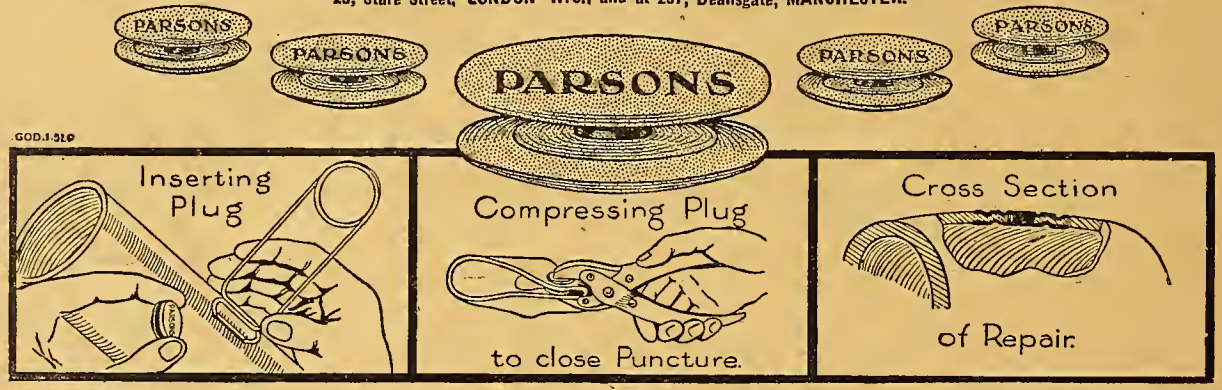
PARSONS RAPID REPAIR KIT

The following is an example of the many unsolicited testimonials which we are constantly receiving, and of which the originals may be seen an application:



Send to-day for the Free Descriptive Booklet. It shows how you can mend punctures in One Minute—permanently, cleanly and cheaply.

Horncastle,
May 9th, 1912.

Dear Sirs,—

"I used one of your Rapid Repair Outfits during my recent Six Days' World's Record Ride of 3,008 miles. I certainly only had three punctures, but I found the outfit a very great help when I had these, as I repaired the tubes in half the time that I should have done had I used ordinary patches I also find when these are once put on they stay for good. I hope you will have a tremendous sale for these, which you will deserve. I shal certainly recommend the Outfit to all my friends.

BOUNCE !

Many firms exist by Bounce. WE don't ! Our turnover for the Half-year ending April 30th—the Winter Half-year, mind you—was £5,000 more than the previous—or Summer—Half-year. This is all right, and points to a few morals, as follow :

1. Bounce will not increase your turnover by 500 pence. The £5,000 has been made by the trade given us by our satisfied customers. Through the customers who have found Hitchen's, of Morecambe, to do as they say they will do, when they "tell the tale."

2. Through the Sunny Jims who have purchased machines from us, and left the choosing of them to us. Anything they get is good, and the price right.

3. Through the Trade, who have placed their Contracts with Hitchen's in preference to buying direct from the Makers, and binding themselves to take a good deal more machines than they are ever likely to sell.

4. Through the Bhoys who have bought new machines on the Deferred, paying a quarter or a third down, and who are now paying the balance by instalments.

"Man wants but little here below, and does not want that little long," so the Poet says. However, we want a lot ; and more than that, we want it as long as we can get it.

We are not satisfied with the £5,000 increase in turnover, even in a Winter Half-year, but we expect a £30,000 or £40,000 increase this Half-year. To get this, we intend to treat you well, as in the past ! To let you have anything you purchase from us on the usual approval terms, which are as follow :

Anything you get from us, if not as specification, you are at liberty to return within three days and have your money back in full.

At the same time, Hitchen's are prepared to exchange at any time. The originality of this offer makes it stand alone. Others imitate us, both in our Advertisements and in our System of Business, but as they are only small fry, and have no stock, we ignore them. Of course, imitation is the highest form of Flattery, and while they think they are advertising themselves in this manner, they are advertising Hitchen's, of Morecambe, the Originators of the system.

People write and ask us why we are fixed up in Morecambe ! Why not be in London, Manchester, Liverpool, or Leeds ? The answer is simplicity itself. If we were in London, or any of the places mentioned, we should not have been able to get the splendid Agencies that we hold, comprising such machines as

P. and M., Scott, Matchless, Clyno, Bat-Jap, Zenith, Humber, Bradbury, Premier, Motosacoche, Morgan Runabouts, A.C.'s, Lincoln Elks, and all the rest of them.

Then again, WHAT IS wrong with Morecambe ? Halfpenny stamp brings you a list from Morecambe. A few shillings on the train will bring you to Morecambe from any part of the Country, or if you have a good Motor Bike, the roads are good about here. If you live in Ireland, there is the boat to and from Heysham, within a couple of miles from Morecambe. If you live in the Isle of Man, the same thing applies. If you live in the Land of Cakes (Scotland), we are quite near you ; and the same with Wales. We are Central for all parts of England, and close to the main lines. What more do you want than all this ? The World is our Playground, and there are the means for getting to every part of it. We send Motor Cycles abroad quite as easily as to Lancaster, the County town, three miles away. We send goods to every British Colony in the World, and to all parts of the Continent.

If you want to buy a machine, and live, say, in the South of England, we do not send it from Morecambe, but direct from the Works, it may be near London or in the Midlands. Therefore, you are just as well off, as far as the matter of carriage goes, as if we lived in London. Or, on the other hand, if you live in Ireland, we send the machine from Morecambe to Heysham, and thence by boat. The same thing applies to Scotland—the Land of Cakes. If you live in the Principality, you are within reasonable distance of the Midlands or Morecambe.

Then again, Bhoys, in the summer time, when the sun shines, and the roads are dry, which is the best place to go to—a large City, with its hosts of tramlines and traffic ; or Morecambe, with its Sea Breezes and its quiet Rural Roads and beautiful Scenery ? You can come to Morecambe for a week-end, enjoy the Sea Breezes, and see the stock and choose what you want.

If you want to buy a Motor Cycle, don't forget the Firm in Morecambe that will treat you well ; and if you come down and purchase a Motor Cycle, they will pay your fare here. You will, of course, ride the machine back, and therefore not require the return fare.

You can buy a new machine from Hitchen's either for cash or on the Deferred, and a second-hand machine for cash, Deferred, or Exchange terms.

What is of the greatest interest to you is the fact that Hitchen's, being in Morecambe, only pay as much in the way of annual rent for their Garage as the London firms pay in a week. Do you twig it ? Hitchen's are able to give you a lot of the London Rent by wanting less profit on their deals. Then again, can you go to any of these places, pick a machine, and try it on the road ? No, certainly not ! You can come to Morecambe, pick a machine, and try it on the road for an hour or more, and see what you are buying. Don't buy a pig in a poke.

Just at the moment we are clearing out our stock of Second-hand Machines and Accessories. If you have not had our list, send us a postcard, and we will send you one. If you are not in a position to pay the full amount of cash down, say how much you can pay down, and how you can pay the balance per week or month. WE INTEND TO SELL. If we cannot sell at our price, we will try and do so at yours, but SELL the BALANCE we WILL. So now you have it off by heart. If you want a new bike, we have the stock, and are open to do business on your terms, if reasonable. When you get a list, knock off 10% to 20% and let us have your bids. We will meet you. Remember, ALL MUST BE SOLD, as room is wanted, and we are having big stock in every day, so please help. The same applies to Accessories, Tubes, Tyres, etc., etc. Now write at once, or come and see the Canary.

HITCHEN'S, MORECAMBE.

Makes your 3½ h.p. into 4½ h.p.

or any power 15% to 25%.

This side shows Jones & Co.'s Patent Jet delivering petrol as vapour to engine.

This side shows your jet delivering petrol in liquid to the engine.

HOW ?
By having Jones and Co.'s Patent Jet Petrol Atomiser fitted in exchange for your old jet. This patent delivers the petrol to engine in thousands of particles instead of in liquid.

WHY ?
This causes the vapour to be properly exploded instead of burnt ; saves the piston head from being carbonised, and gives at least 15% to 25% more power.

WHO SAYS SO ?
Expert riders of world repute. Copies of testimonials free.

WHAT GUARANTEE ?
Your money returned within 14 days if the jet does not improve your engine 15% to 25%.

ANY CARBURETTER
fitted. Send your old jet, or give exact particulars of your carburetter. *From any good Agent, or*

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.

WAUCHOPE'S

9, SHOE LANE, FLEET STREET, LONDON, E.C.

'Phone: Holborn, 5777.
Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

3½h.p. Triumph, splendid condition; £27/10.—C. W. Smith, Northgate, Darlington.

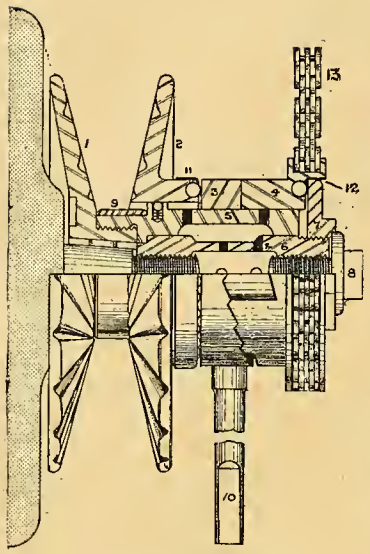
The Development of the Modern Lightweight.

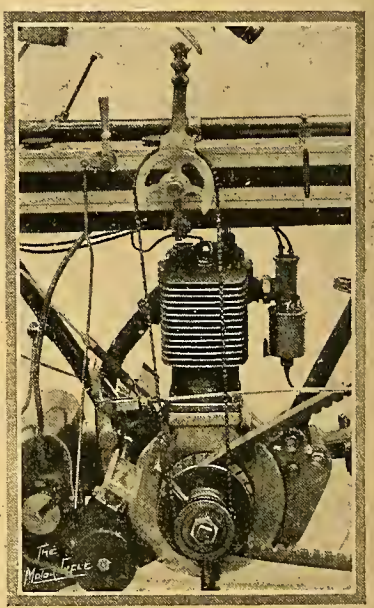


NINE years ago, in the very early days of the motor cycle movement, *The Motor Cycle* took up a very firm attitude with regard to the development of the lightweight motor bicycle. Certain people who took a very prominent part in the movement were urging the development of a very light machine weighing 80 lbs.—little more, in fact, than a motor-assisted pedal cycle. One of the individuals in question even went so far as to have a machine specially built for himself, but it was the only one of its type actually constructed. We heartily condemned machines of this nature, as they were hopelessly inefficient and far too light to be comfortable to ride, and wholly unsatisfactory as self-propelled vehicles. They had no speed, were not only slow up hill, but bad climbers, and possessed the sole advantage of portability. By dint of hard work and the spilling of much ink these facts were driven home, and, furthermore, every effort was put forward to persuade the A.C.U. to make the lightweights compete as nearly as possible on equal terms with the heavyweight now on the market. This year we have put a single and twin-cylinder medium-weight to severe practical tests, and they have emerged therefrom with flying colours. Change-speed gears and much improvement in the engines, together with a reasonable view of the weight question, have evolved a really practical machine. Such a mount is powerful and speedy, it will climb all main road hills, and maintain a good average speed. It has power enough in reserve, and is just that type of machine which should be the tyro's first mount.

The Glut of Open Hill-climbs.

WE refer elsewhere to the proposed restrictions which the A.C.U. intend to issue respecting open hill-climbing competitions. Against well organised hill-climbs, such as that held by the Birmingham M.C.C. at Harley Bank last Saturday, when every precaution is taken to safeguard both performer and spectator, we have nothing to say. Unfortunately, it has been possible hitherto for any club—even if only a few months old and whether experienced in the matter or not—to apply for a permit and hold an open hill-climb. Consequently many climbs have been held on unsuitable hills, and the organisation has often left much to be desired, and the inevitable result has been a number of unfortunate accidents, generally to competitors, but sometimes involving damage to spectators as well.

Racing in pairs certainly adds to the danger, for there are then two riders on the road instead of one—a matter of some importance at bends and corners—and, further, riders are induced by the excitement of competition when endeavouring to pass a rival to take risks which they seem not to do if riding singly. The neck and neck racing has now been banned by the A.C.U., and we think with reason. The ban will, however, still further rob hill-climbs of interest. There is no doubt that hill-climbs have their use, and that much of the high efficiency of present day machines is due to competitions of this nature. It must, however, be borne in mind that the tendency of hill-climbs is to develop a type of machine which is not wanted, for it is neither comfortable nor satisfactory for touring purposes or ordinary riding, for which 99% of motor cycles are used.



THE BRAMPTON VARIABLE GEAR.

No. 1 and 2 pulley flanges.
No. 3, inside stepped cam.
No. 4, outside stepped cam.
No. 5, sleeve.
No. 6, sleeve engine nut.
No. 7, end thrust race nut.
No. 8, locking pin.
No. 9, free engine ring.
No. 10, stay rods.
No. 11 and 12, ball retainers.
No. 13, operating chain.

The solid black marking on Nos. 5 and 6 are oil holes for permitting the lubricant applied to the outer working surface to pass to the inner working surface.

THIS is an adaptation of the variable pulley method, a great advantage of which is that a large variety of gears can be obtained. In this case the number is seven, varying between the ratios of $4\frac{3}{4}$ and $7\frac{1}{2}$ to 1. The operation is by stepped cams, the seven steps holding the cams securely in the desired position. The inside cam is free to move laterally, but not to revolve; the outer can revolve, but not move laterally. Thus the outer cam is able to force the inner against the pulley flange, and thus raise the gear. There is no provision for taking up the slack of the belt, but instead rounded grooves are cut in the pulley in such a way that they are tangential to the free engine ring, and it is claimed that by means of these grooves the belt is prevented from slipping, even when running slack on the lower gears. The operating lever is conveniently placed on a bracket near the tank, and connected by a chain to the revolving cam. The accompanying illustrations will enable the reader clearly to understand the working of the various parts. The weight of the whole gear and operating mechanism is seven pounds. It has been tried by H. C. Newman, the noted hill-climber, and spoken of in high terms. It was expected that he would use this gear on his Ivy-Precision at the Birmingham M.C.C. hill-climb.

An Ivy-Precision motor cycle fitted with the new Brampton variable pulley gear. The method of operation is clearly shown.

BIRMINGHAM - LAND'S END - BIRMINGHAM OFFICIAL RESULTS.

The Birmingham M.C.C. Committee passed the following results at a meeting last week:

	Error.
WINNER OF LYCETT TROPHY.—T. Pollock (3½ James) ...	20s.
SECOND AND SIDECAR PRIZE.—A. D. Arter (3½ James sc.)	27s.

GOLD MEDAL WINNERS.

	m.	s.
W. E. Baylis (3½ New Hudson)	1	15
F. C. Sangster (3½ Ariel)	1	15
J. H. Percox (3½ Alldays)	1	40
A. J. Stevens (2½ A.J.S.)	2	40
P. J. Evans (6 Enfield sc.)	2	45
R. W. Duke (Zenith-Gradua)	4	10
H. Ball (3½ Triumph)	5	20
R. V. C. Brook (3½ Precision)	6	17
B. Bourke (New Hudson sc.)	6	50
H. D. Jones (3½ Zenith-Gradua)	7	0
F. A. McNab (3½ Trump-Jap)	7	15
F. Read (2½ A.J.S.)	8	15
S. Wright (3½ Humber sc.)	8	20
L. Newey (3½ Ariel)	9	45
H. Walters (2½ A.J.S.)	9	45
H. Rem Fowler (3½ Norton)	11	5
H. Stevens (5 A.J.S.)	12	25
D. Cork (5 A.J.S.)	13	50
A. Young (3½ Kerry)	15	10
H. Blocksidge (3½ B.S.A.)	15	15
T. Peck (3½ Rudge)	35	26

BRONZE MEDAL WINNERS.—B. Yates (3½ Humber sc.), H. J. Cox (3½ Premier sc.), N. C. Blackwell (6 Zenith), and Dr. B. Fawssett (8 Chater-Lea sc.)

The winner of the sidecar prize, A. D. Arter (3½ h.p. James and Canoelet sidecar), who ran most regularly throughout.

SURVIVORS IN THE BIRMINGHAM-LAND'S END-BIRMINGHAM RUN. The A.J.S. team of five riders, all of whom completed the difficult course and gained gold medals.

P. J. Evans (6 h.p. Enfield sidecar), who experienced no more trouble than broken valve springs. He won a gold medal.

OCCASIONAL COMMENTS.

By "IXION."

Mudguard Attachments.

Years ago, when I first rode a motor bicycle, I used to replace a mudguard stay about every fifty miles, until in desperation I went to a birdcage maker and got some pieces of extremely stout wire, which would better have been termed steel rod, and made a good job of them.

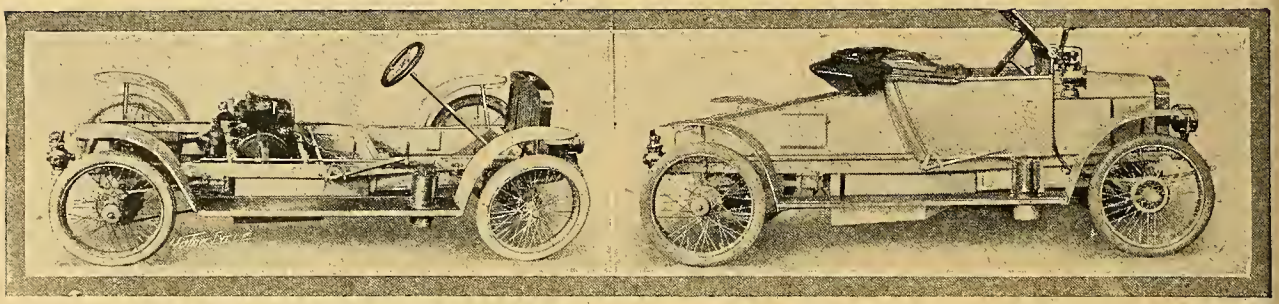
For many seasons past I have not broken a single mudguard stay, but I have snapped many a mudguard, and I think the trade have still a good deal to learn in this respect. At the stern of the machine a common fault is to mount the rear mudguard on the carrier without increasing the strength of the guard or its attachments.

Now of all vibratory parts on a motor bicycle the rear carrier is the worst, as any rider can tell by laying his hand on it over a bumpy road. Plain bolts and straps are useless for securing light toolbags attached to it, and it is small wonder that a mudguard soon breaks its weakest point, either the small screw perhaps employed to fasten it to the fork bridge, or else the guard itself—probably at the drilled portion.

With front mudguards the weight of the front wheel stand renders the problem more acute, but in any case vibration centres at the middle of the guard, where it is bolted to a bridge half-way up the forks. The two ends of the guard usually have a certain amount of sway, and this central point gets shaken as a terrier shakes a rat. Add the fact that the securing bolt at this point is seldom cleaned, and the cause of the guard's ultimate decease is not hard to find.

Wanted, Commonsense.

I am extremely sorry to see that an obsolete type of adjustable pulley still lingers on many machines—I refer to the pattern which requires tools for its operation. This pattern is just tolerable when the large thin hexagon nut is made of really staunch stuff, and the spanner provided for loosening it is also a first-rate job; but these essentials are by no means universal. As a journalist I often ride many makes of machine in a season, and in each of the last three summers I have ridden a good 3½ h.p. machine from Coventry to Cornwall and back. On this particular run (if the sporting and scenic routes are selected) there is a lot of high gear work—fast, easy, undulating road, easily negotiated on a 3½ to 1 gear, if the engine be of that thoroughbred race which does not tug or knock under a lofty gear; but towards the westward end the sporting rider will visit several steep and cornersome hills, which demand a gear of 5 to 1 in dry weather and an even lower gear in wet or wind. With each of the three machines referred to I was compelled to make the entire run on a 5 to 1 gear, because the adjustable pulleys were of the tool-operated type, and badly made at that. The threads of the loose flange and the locking nut were so carelessly designed that the two parts locked up dead hard in running; the nut was of soft stuff, and the spanner was soft and light. I dare not leave the job of reducing the gear until I got amongst the hills, for it was an open question whether I should be able to shift the pulley at all. Now there are two or three finger-operated pulleys on the market to which I have found no objection whatever in prolonged use. With them gear reductions are the work of a moment. I cut the belt 12in. from the end, and insert a second hook fastener; I make up a 11in. bit of belt and put a half fastener at each end. When I strike the bad hills I reduce the pulley with my finger, and change the 12in. bit of belt for the 11in. The job is done in two minutes. I do not blame the trade for refusing to standardise other people's patents, for I know how it swells selling prices; but there are dozens of different principles on which a finger-operated pulley can be designed; and every maker ought either to fit a tool-operated pulley of sound design and decent material, or alternatively to bring out a finger-operated type. Only a sledge hammer and a lathe carrier could shift the pulley of a brand new T.T. machine now lying on loan in my garage.



The Counter-shaft Adjustable Pulley.

I am still waiting for my ideal single-geared 3½ h.p.—the machine with chain drive (in aluminium case) to a ball bearing counter-shaft with an 8in. belt pulley, which is to increase the life of the belt to 5,000 miles, perhaps. This machine *must* come, unless I am a lying prophet, and I suppose it will want an adjustable pulley like its predecessors. In case anybody is experimenting, may I point out that when the pulley is so big it need not be made of such hard wearing stuff as a 4in. engine pulley, and I should not be surprised if a cheap wooden pulley did not suffice in this position. In that case adjustability could be procured by inserting washers between the flanges. I do not think the very heavy metal pulleys employed on some counter-shaft transmissions are at all necessary. Three 8in. wooden pulleys would cost less than one metal pulley of the same size, and would wear longer, besides reducing weight considerably.

Standardisation in 2000 A.D.

After weary years we are at last in sight of standardisation in tyre rims, but I doubt if we shall get it in other obvious details until 2000 A.D. Here is my latest wail. I have purchased a huge gasometer acetylene lamp, and after much lurid correspondence with its makers have at last persuaded them to issue a bracket which cannot shake loose, and which permits me to leave the lamp at home on brief daylight spins without unscrewing twenty-four nuts, or alternatively carrying two huge spiked prongs on my handle-bar, which would infallibly impale me if any accident caused me to make one of those graceful periodic flights over the handle-bar, which have become proverbial with so clumsy a rider as myself. But "orl is not yet peas." Last week I was testing a Triumph, a Rudge, and an Ariel. The clips were too small for the Triumph handle-bar, and too large for the Rudge; they would not go on the Ariel at all, as its arms were sharply backswept from the steering head. Surely the diameter of a handle-bar might be standardised. This particular detail affects a host of fittings and fundamental necessities. Yet when I go to the factories with rolls of leather, rubber, or canvas under my handle-bar clips I see the running shed manager turn up his lordly nose at my untidiness.

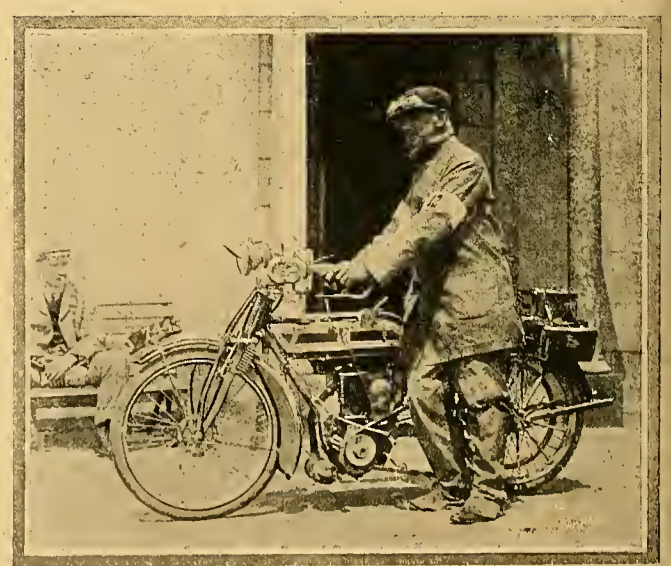
Through Buckinghamshire Lanes on a G.W.K.

Views of the chassis and complete vehicle.

WHEN first we saw the smart looking little vehicle which bears the initials G.W.K. it impressed us favourably, and we looked forward to a demonstration on the road to confirm our opinion that it was as good as it looked. The initials are the first letters of the names of the three members of the firm, Messrs. Grice, Wood, and Keiller. Mr. J. T. Wood, under whose skilful guidance the little cycle car performed so well on Birdlip and Saintbury hills in the A.C.U. One Day Trial, met us at Slough with a new G.W.K. fitted with a body which was standard but for the absence of the side door.

There was much to be learned from this trial of a new type, not only as regards springing, cooling, steering, control, and general running, but more especially the behaviour of the friction gear, a type of transmission which up to the present has been much criticised.

A Hilly Course.



As is natural on the occasion of a trial run, we set out to find a suitably hilly course for the test, and found it in the Buckinghamshire lanes. First came quite a steep pitch near Beaconsfield, which the little vehicle took in splendid style. Then we entered the Amersham Road, taking in the reverse direction part of the old quarterly trials course. Here we found ample occasion for testing the cyclecar. On the longest hill between the two towns we came upon a traction engine with its train of trucks, and on the steepest part of the hill (about 1 in 9). Here it was too narrow to pass, so we had to remain stationary on the rough edge of the road and wait till the obstruction had gone by. The restart was made without a falter, and the vehicle got quickly under way; in fact, its acceleration was quite remarkable.

Dropping gently down the rough surface of Gore Hill we entered Chesham and made for the steep ascent of Rectory Hill (1 in 7), which was climbed in good form on second speed (there are four positions in the gear quadrant). After tea at the picturesque Crown Hotel, Mr. J. T. Wood courteously handed the wheel to the writer, whose novitiate started with the ascent of our old friend Gore Hill (1 in 8). Though in unaccustomed hands the G.W.K. made a capital ascent on second speed, and on other steep pitches encountered during the rest of the run not the slightest difficulty was experienced.

The springing was excellent. Lanchester type of springs are fitted to the rear, and taking it as a whole the vehicle rides most easily. The standard body is comfortable, and with the driver's and passenger's feet extended under the bonnet, a high dashboard, and conveniently placed screen, one is splendidly protected against the elements. The control is well arranged; the right pedal is the accelerator and the left operates the friction disc and the brake. The depression of the left pedal, which may be termed the clutch pedal, withdraws the friction disc from the flywheel, and a further movement presses a drum on its forward end against a fixed brake shoe.

Periodical Engine Vibration.

The gear lever on the vehicle we drove was a little stiff, but this was due to its newness and to the presence of a little excess of paint. The steering was also a trifle stiff, also due to newness and possible want of lubrication, but the G.W.K. steered well and was well in hand at high speeds. The two-cylinder 8 h.p. vertical Coventry Simplex engine ran without vibration up to thirty miles an hour and pulled well. Over thirty that period present in all twin engines with vertical cylinders was apparent, but not objectionably so, while over a certain speed it disappeared altogether. On the whole the G.W.K. impressed us most favourably. It has "arrived," and is a practical, handy and reliable cyclecar. We have nothing but praise for the friction gear.

BIRMINGHAM - LAND'S END - BIRMINGHAM RUN. W. T. L. Spiers (3-speed Macbeth-Precision) at the turning point, the Land's End Hotel.

My Most exciting Ride: No. 3. - O. C. GODFREY.

Interrogated by L.C.

"WHICH is my most exciting ride?" said Godfrey, in response to my query. "I have had so many, you see." I saw that I must jog his memory, for I had an idea of my own as to which was his most exciting ride, and I put it to him in one word. "Frome," I suggested, remembering that some five years ago Godfrey had sped up Frome's Hill, near Hereford, at a terrific speed and collided with a spectator at the top. "No," said Godfrey, "I remember nothing of that incident, for I was knocked senseless at the top, and the ride remains a blank. All I know is that it was my first experience of a fast motor cycle. Last year, in the Tourist Trophy Race, I had some excitement, for although I started out with an idea that I should finish near the top—for I knew I had a fast motor cycle under me—yet I experienced blue funk at the corners and sighed with relief as I passed them. But that was nothing compared with another experience of mine, and I think I can easily call this my most exciting ride.

"It was at the Easter meeting of the Brooklands Club last year. During the week-end I had competed in the London-Edinburgh Trial, and arrived back in London on Sunday morning, without having slept since Thursday night.

Racing when Dead Tired.

"Straightaway to Brooklands I went to get my Indian in trim for Monday's races. I was terribly keen on winning, for Jake de Rosier had recently come to England, and I suppose I wanted to create a good impression. Jake helped me tune the machine, and after a little practice I went home and snatched a few hours' sleep.

"On the morrow I was dead tired, but I managed to get to Brooklands, and, in a semi-stupor, I realised that the first race in which I was engaged was about to start. I don't know exactly how I got started, but have a hazy notion of the limit men going off, leaving me at scratch to catch them. It was quickly apparent that my machine was very fast, and I just let her all out, and lay down along the tank, but half awake. I kept near in, and recollect the occasional purring of the other competing machines as I passed them one by one. Still I lay along the tank while the Indian sped along. I was sufficiently master of my senses to turn into the finishing straight, and I won at the fastest speed which has been credited to any winner in a motor cycle race at Brooklands. Once in the paddock, I felt myself losing all knowledge of everything, and I fainted away. While on the track I was kept awake merely by a determination not to throttle down as I was tempted to, and the very strength of that determination kept my brain active, but at the finish I was thoroughly knocked out, and a big bruise all over my chest denoted the heavy manner in which my body rested along the petrol tank. I can recall many narrow escapes and exciting adventures on road and track, but none of them occasion such dread within me as that terrible ride on the track at Weybridge."

It is known that O. C. Godfrey is contemplating retiring from racing events.

THE GLUT OF OPEN HILL-CLIMBS.

A.C.U. RESTRICTIONS TO BE EXPECTED SHORTLY.

IN view of our recent editorial articles regarding the glut of open hill-climbing competitions and the risks which have to be taken by riders owing to the selection of unsuitable hills, the following, culled from the A.C.U. notes in the *R.A.C. Journal*, is interesting:

"The very high speed now commonly achieved in hill-climbing contests is receiving consideration by the committee. The capabilities of the modern motor cycle have improved so much during the past few years that the conditions under which these events are held have completely altered. Whereas originally it was considered a good performance for a machine to climb—at whatever speed—a particular hill, it is now merely a matter of which machine makes fastest time. Often, where the hill is of an intricate nature, the riders have to take undue risks in their efforts to display the full capabilities of their machines. . . . It really looks as if hill-climbing events, in their present form, have fulfilled their purpose. The committee will, therefore, consider what restrictions it may be feasible to impose without robbing these contests of their sporting character or checking their usefulness in the development of the motor cycle."

A Rare and Refreshing Run.

By FRED GILLETT.

FROM the sidecar attached to Hal Hill's Zenith in the N.W. London passenger trial it was my good fortune to study some phases in speed-emotion, and to witness a remarkable exhibition of self-restraint on the part of the driver.

Put a man on a machine with plenty of power and elasticity; give him an open road with nice straight stretches and other temptations; then tell him he must take six hours in getting from Jack Straw's Castle to Coventry. I appeal to the shade of Jack Straw, and ask, is this reasonable? Is it kind? Is it not asking too much of human nature? Is there no society for the prevention of cruelty to motor cyclists to step in and tell the North-west London Club that these restrictions, these controls and secret checks, are legal cruelty to Hal Hill? Will not some great orator, some public speaker, like W. Cooper, raise his voice and denounce the shackles of schedulism?

Hoping for a Traffic Stop.

In spite of the persistent self-control required to achieve the journey without getting there too soon, it was accomplished, and we reached Coventry neither before nor after our proper time. The first section presented most difficulties. We found ourselves within two miles of Aylesbury with twenty minutes in hand. Could it be done? Or rather, could it be not done? Never have I seen so pathetic a display of crawling. There was a turning off the road in Aylesbury with an island facing it. We played out a little time by circumnavigating that island. Seeing and misunderstanding this manœuvre, a well-intentioned passer-by waved and wildly shouted "Wrong road!" We thanked him politely and pursued the even "fiver" of our way. An even fiver in this case signifies 5 m.p.h. There were some cattle on the road, and we hoped for a traffic stop. No such luck. The horned ruminant is even a greater chuckle-head than its reputation admits it to be. In this same town Pooley had previously negotiated a complete and effective dog-stop, but he didn't want it, and a dog in a front wheel is worse than a dog in a manger.

We saw a good deal of Williams and Stern as far as Banbury. It was most annoying when they retired with a broken rocker, because they carried a certain amount of commissariat on board which I had found useful for reviving the faded glories of an early breakfast.

At Bicester, Os. Hill tried to borrow my watch, on the pretext that his own had stopped. I had to say that my own wasn't going either—anyhow, not with him. The confidence trick is out of place in an event of this kind. We bought a morning paper at Bicester, and I read out the latest cricket as we went along, as there seemed to be nothing in the rules to restrain passengers from reading to their drivers.

A strange thing happened to Phillips hereabouts. The lamp leapt off the near side of his sidecar and alighted on the road on the offside of the bicycle. There is nothing to account for this phenomenon scientifically. It must be the work of motor bandits putting dynamite in the lamp bracket.

A Dust Up near Coventry.

Somewhere beyond Warwick we had a merry dust-up with Pither, during which I noticed that the black hand of the speedometer was nudging the red hand. We passed Victor Hart occupying the presidential seat in the A.C. driven by Fred Hill—on the Shakesperian maxim that it is better to bear the Hills we have than fly to others that we know not of.

There was another dusty thrill near Coventry in which S. Tessier was involved. At the psychological corner the wheel of the sidecar lifted in a way which made the petrol curdle in the tank. This was the best thrill we had the whole day.

During lunch I recited to H. Morgan the little verse beginning "Seated one day," in memory of Farlow last year. I think lunch must have had a demoralising influence on Hal Hill, for after that meal his hitherto wonderfully maintained self-restraint broke down, and he decided to make a go-as-you-please return journey as a mute protest against the paralysing monotony of 20 m.p.h. There are limits to the endurance of every human being—except perhaps Karslake.

Three Up on Corners.

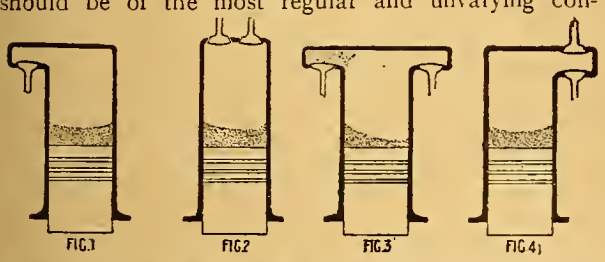
Rowden's machine having succumbed to a sudden seizure, that intrepid driver occupied the Zenith's carrier on the return journey. With three up, when taking corners it was a case of "when father says turn we all turn." Rowden reported a most comfortable ride home, sitting on a folded mackintosh and a coiled rubber belt, though there were moments when the words of the latest Gaiety play were realised, viz., "I shall bounce yer!"

Somehow we missed our homeward way and went up Edge Hill instead of Sunrising. With a fairly hot engine and three up we climbed it easily, in spite of a flock of sheep which caused a change down.

Tea was taken leisurely at Tring, ostentatiously in the non-stop section in order that we might enjoy the pangs of others—especially Mundy and Griffith—who preferred the uncertain tenure of a silver cup to the certainty of a cup of tea.

The route throughout was excellently arrowed by Frank Thomas, whose operatic acquaintance with "William Tell" gives him expert sagittarial knowledge.

So much for the emotions of this rare and refreshing run. The moral is sufficiently indicated in what I have said about self-restraint.



The Incomplete Fourth Stroke.

AT the moment when the inlet valve closes and the piston commences to compress the charge, there is, in the cylinder of the ordinary Otto cycle gas engine, a volume of waste gas equal to between one-fifth and one-fourth of the total cylinder capacity.

The retention of this proportion of the products of the last explosion is due to the incompleteness of the fourth—or scavenging—stroke of the cycle, during which the piston displaces only about four-fifths of the contents of the cylinder and combustion space, leaving the remainder to mix with the next incoming charge or otherwise to dispose itself.

The Position of the Spent Gases.

What amount of mischief is done by this residuum depends principally upon the design of the cylinder head and the disposition of the valves therein. The best that can be hoped for is that the spent gas will mix uniformly with the fresh charge, thus reducing its combustibility as a whole but not introducing irregularities of consistency into it. The worst that can happen is for the inert and no longer ignitable gas to occupy a position near to the sparking plug, where its presence will more or less insulate the fresh charge from the heat of the spark. It is, of course, of the greatest importance that the body of gas which has to transmit the igniting flame to the bulk of the charge should be of the most regular and unvarying consistency, otherwise the speed with which the combustion is propagated after ignition will not be the same in any two cycles, which is fatal to efficiency in the operation of the high speed petrol engine.

The diagrams represent four arrangements of cylinder heads and valves, showing the probable positions taken up by the component of waste gas at the end of the charging stroke.

Fig. 1 shows the valves placed side by side in a pocket. In such a design it is probable that, when the inlet valve opens and the piston begins its downward movement, the spent gas will precede the fresh charge and travel down the cylinder, leaving the combustion space to be filled with pure gas.

Fig. 2 shows a hemispherical combustion head with valves in an inverted position. The tendency here, also, would be for the waste gas to obey the suction of the piston and take up a position near the bottom of the cylinder.

Fig. 3. Here the two valves are each in a pocket on opposite sides of the cylinder. In this case the indrawing of the new charge would tend to sweep a portion of the old charge into the exhaust valve pocket opposite, the balance following the piston.

Fig. 4 shows the arrangement where the two valves are in one pocket, one inverted and above the other. Here, again, the tendency would be to drive the residual gas down the cylinder after the piston.

In considering the above instances, it must be borne in mind that more or less mixing must occur between the cool, moist, fresh charges and the heated remainders of the old ones, but assuming, however, that no mixing takes place, and that combustible and incombustible gases remain entirely separate at the moment of firing, there is still the fact that a substantial proportion of valuable cylinder volume is taken up unproductively.

There are a number of possible ways by which this defective fourth stroke may be made properly to fulfil its object. There are mechanical devices of various kinds, such as differential arrangements for causing the piston to travel, on its exhaust stroke, right to the top of the cylinder; spring pistons, auxiliary pistons, movable cylinder heads, and so on. There are also such methods as the admission of a gust of pure air through a port low down in the cylinder wall, this gust being admitted just after the opening of the exhaust valve and the fresh air being swept out by the piston on its fourth stroke. Or, on similar lines, two entire strokes may be dedicated to cleanliness, the piston drawing in pure air on its fifth stroke and expelling it on the sixth preparatory to beginning the cycle over again by the inspiration of a fresh charge of gas. Finally, there is the use of a forced feed, the required pressure being obtained variously from crank case compression, from a separate pump or fan, or otherwise.

Differential Stroke or Forced Feed.

The differential stroke method is perfectly effective as a scavenging stroke, and has the advantage—in most of its forms—of causing the succeeding suction stroke to be prolonged also. The forced feed system, however, is not necessarily so satisfactory. Unless the new gas is admitted through a port low down in the cylinder wall so as to drive the spent gas upwards through the exhaust valve, or unless the incoming charge is deflected down one side of the cylinder, so as to perform a scouring evolution; there is no certainty whatever that the cylinder will contain nothing but pure gas at the moment when both valves close for the explosion.

In the present position of the petrol engine, where a high degree of efficiency has been reached, it is surely anomalous that the prospect of a twenty-five per cent. increase of piston thrust should not evoke the necessary contrivance to secure it. J.B.

MILITARY MOTOR CYCLING NOTES

BY "CELERITER"

IN the event of a national crisis the members of the Legion of Cyclists and Motor Cyclists will render most invaluable assistance in many ways: Firstly, they could be called out in a moment of stress to protect important railway bridges and telegraph lines against spies prior to the commencement of hostilities. A study of recent history, more especially of September, 1899, will show the layman how, when relations are strained between two possible belligerents, ministers are very shy of aggravating the situation by mobilising the Army, for the order to mobilise might well be taken as a *casus belli* by the other side. In such a case the enemy's secret agents and spies would remain practically unwatched during the most critical period.

A Special Job for the Legion.

To mobilise would probably precipitate war, but to mobilise the Legion of Cyclists would have no political signification, and this could be done by the hon. secretary of the Legion merely calling upon corps commandants to call up all the men they could get together. We are at present an unofficial body, and we therefore have this great advantage that we can protect the country against the action of spies without endangering the negotiations of officialdom. It is a point worthy of the utmost consideration, and one that has not escaped the notice of the powers that be.

In the very first stages of the crisis the motor cyclists of the Legion will be called upon to render very valuable services. It must be remembered that when the order to mobilise goes forth from the Cabinet Council the country will be in a turmoil.

Assisting Mobilisation.

Railway lines and telegraph lines will be congested in all cases, and they may also have been tampered with. This is where the motor cyclists will come in from the very start. The corps of the Legion will be so organised that they will form a complete chain of inter-communication up and down the land. Whilst some will be running on the long trail from the War Office to distant command headquarters such as Salisbury, Lichfield, York, and Edinburgh, others will be working local areas, whilst the pedal cyclists will be used for warning outlying Territorial detachments in their own vicinity. A provisional scheme has been worked out already which provides the spreading of the news throughout England, South Wales, and the Lowlands within twenty-four hours, even if all telegraph and railway lines are cut. To put this scheme into practice, however, it is necessary to have branches of the Legion throughout the country, and riders are invited to send in their names for enrolment.

The Second Mobilisation Test.

There has been a splendid response to the appeal in *The Motor Cycle* of May 16th, but it is not yet too late for other motor cyclists to take part in the second mobilisation test on June 9th. This journal will present a silver cigarette case to the rider who makes the best record as adjudged by the umpire. Write to-day to Capt. Trapmann, 117, Piccadilly, W., sending the prescribed postcard and three penny stamps for particulars of the rendezvous.

Trooper Selby C. Bridger, of the Lancashire Hussars, who has used his 5½ h.p. Triumph in conjunction with the scouting section of his regiment. We are told that the experiment has proved a great success.

L.-Cpl. Thomas (5-6 h.p. F.N.), L.-Cpl. Gates (8 h.p. Matchless), and Trooper Wootton (3½ h.p. Rover), who are motor cycle scouts attached to the Loyal Suffolk Hussars.

Hub & Countershaft Gears.

BY "IXION."

AT last the principle of variable gears, for which a knot of enthusiasts have fought so hard and so long, is accepted; and the arena is changed. We no longer struggle for the adoption of a variable gear as an integral item of every refined tourist specification; but we contend whether a hub gear or a counter-shaft gear is preferable.

The purpose of this article is to suggest that, although there is a distinct opening for good countershaft gears at the present moment, the hub gear should eventually sweep the boards.

For the moment the dominant prejudice is probably in favour of counter-shaft gears. The first countershaft gears enjoyed quite an enviable record. Though they were mostly fitted to very primitive tricars, and utilised *via* a ridiculously fierce and microscopic cone clutch to connect up the power of a crude and slogging single-cylinder engine. they never occasioned serious trouble.

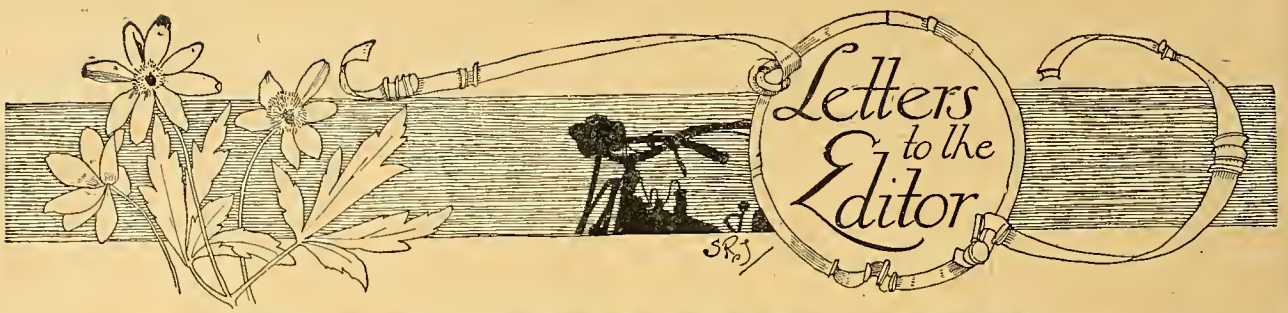
A Seven Year Old Gear Box.

Wear was slow, and often confined to the keys and keyways of the gearshafts. I inspected quite recently a sample of the Humber two-speed gear box, as applied about 1906 to a 5 h.p. single-cylinder Olympia tandem, and the tool marks were still perceptible in places on the gear wheels, while new keys and keyways represented the sole replacements in a life of nearly seven years. Such experiences become public property, and have induced a certain prepossession in favour of counter-shaft gears. Other facts have also to be taken into consideration. The counter-shaft gear usually permits easier accessibility of the rear wheel; and in most cases it doubles the belt life by employing a 6in. or 8in. pulley in lieu of the normal 4½in. type.

On the other hand, more than two speeds are ideally desirable for most purposes. The contrast between ticking along at 30 m.p.h. on a 3 to 1 gear and rattling along at the same speed on a 5 to 1 gear can only be realised by owners of three-speeded machines. These two ratios are most desirable for solo work, while occasional emergencies further demand a still lower gear, say of 7 to 1 in solo work and of 9 or 10 to 1 in sidecar work. Even a four speed hub gear is by no means a distant possibility, and as soon as the riding public is educated up to a four-speed hub, it will refuse to buy any gear providing fewer ratios.

As Reliable as a Magneto.

At present there are only a few detail complaints brought by practical riders against the three-speed hub gear. It has thoroughly proved its reliability in many a searching public test, and so long as it is kept oiled, and its spindle is prevented from revolving by proper attention to the locking devices, it is probably as reliable as a magneto or a carburetter—which in these days is high praise indeed. We should only complain that the oil-retaining devices are inefficient, and that lubricant messes up the neighbourhood of the back wheel and gets on the tyre; that the control devices might possibly be stronger; that in some instances we cannot get sufficiently low bottom ratios without screwing out the engine pulley flange to suicidal dimensions; that it is a most toilsome business to remove the wheel to change a tyre; and that the gear controls need adjusting with rather tiresome frequency, albeit the adjustment is quite easy.



All these trifles can easily be remedied, and, without doubt, improvements will come very speedily indeed. To facilitate removal of the rear wheel some quick detachment joint will probably be incorporated in the control rods, so that the adjustments all remain *in statu quo*, and the wheel will be as readily detachable as that of a single-geared T.T. mount. The oil-retaining properties of the hubs will be perfected, so that the wheel keeps cleaner and requires less attention from an oil gun (at present half the oil injected is wasted); and hubs will be marketed with a greater reduction for sidecar work.

The Hub Gear of the Future.

From the technical aspect, several valuable advances are inevitable. The first is the probable provision of a fourth speed, which will be invaluable in sidecar work with a single-cylinder engine, and in solo work with a low-powered engine.

Most of the hub gears at present on the market dodge certain difficulties of design by carrying the clutch beyond the gears, instead of at the belt drum end. This is equivalent to placing the clutch of a motor car on the propeller-shaft. It means that the gear, and not the clutch, bears the brunt of the shock of engine explosions, and this explains why it is not advisable to fit chain drive to existing hub gears. The strain on the clutch when the low gear is in operation is tremendous. But a hub gear runs more slowly than a counter-shaft gear; it should therefore wear longer.

We may hope, therefore, that we shall eventually be offered a neat, oilproof four-speed hub gear, completely reliable, and of light weight and practically everlasting wear, with the addition that its presence will not hamper removal of the back wheel, except by demanding the loosening of two snick joints in the control rods. Finally, this gear will allow us to use a 6in. pulley, which with a 20in. belt drum (the largest diameter permissible on a 26in. wheel) will give us ratios of, say, 3⅓, 4½, 6½, and 10 to 1, so enabling a lightweight to travel on level roads at over 50 m.p.h. and climb any hill, or a 3½ h.p. to take a sidecar anywhere with speed and certainty, and average well over legal limit with ease.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Problem of the Automatic Carburetter.

Sir,—Referring to the letters published in *The Motor Cycle* for May 23rd, I am now a strong believer in the Binks two-jet automatic carburetter. I have failed to get anything like equal results out of two other makes. I do not see what Mr. Pickett has got to object to in Mr. Charles Binks's letter. I can rather sympathise with the latter in having to enter into a controversy with a gentleman like Mr. Pickett, who apparently knows very little about the subject. In your leading article on automatic carburetters I think you hit the nail right on the head.

CHAS. W. REYNOLDS.

Fifteen Miles with a Broken Valve.

Sir,—The other day I was out for a run on an old 3½ Rex when the stem of my exhaust valve broke, leaving about an inch and a quarter between it and the tappet. I had no tools except an adjustable spanner, with which I changed over the valves. The inlet now became automatic, and by taking rubber tube from generator, pushing one end of it up on valve stem, which it fitted tightly, and tying it around the contact breaker cover, I extemporised an inlet spring. The machine, being warm, started easily, and I did fifteen miles in an hour and a quarter. Perhaps the tip may save some of your readers a weary push of many miles.

WILLIAM A. RYAN, JUN.

Tyres for Motor Cycles.

Sir,—We were very pleased to notice the remarks made by "Ixion" on page 528 of your issue of May 16th.

We have felt for a long time that for the present high-powered motor cycles a heavy tyre is required to obtain the necessary wearing powers, comfort, and immunity from punctures. For this reason we have spent a year or two in scientific experimenting to obtain the best possible tyre, practically regardless of cost.

As you know, this is being put on the market this year in the shape of our new or No. 1 pattern, and the demand has proved that a number of riders are prepared to pay a good price for a reliable article. We know that the tyre is certainly higher in the first cost than some other makes, but the first cost is the last.

W. AND A. BATES, LTD.

The Danger of Uncontrolled Dogs.

Sir,—I see a letter under above heading in your issue of May 23rd, and can sympathise with the writer. In this country, where the dog tax is less than in England, only 2s. per dog, and 6d. for stamp, these curs constitute a regular reign of terror for motor cyclists. A short time ago I was driving my nearly new Triumph about 15 m.p.h. up a slight hill, when a large sheep dog suddenly jumped out of a hedge and charged my front wheel. I was smashed down, and lay with my right thigh pinned between the tank and the ground. Front wheel was so badly buckled that a new one was necessary, and four spokes and cyclometer broken. New lamp and horn broken up, spring forks twisted and broken, and ball bearing joint bent. Number plate and spindle also injured, besides other slight injuries. My coat was torn, and a hole sawed through the toe-cap of one boot by running belt. Fortunately I escaped personally with some bad bruises. Could you kindly inform me whether I have not a claim on owner of this dog? He promised to pay at the time, but I hear since that he is now in a different frame of mind. I have a witness, a push cyclist, who was behind me and saw the whole thing. A few successful prosecutions would do a lot to get rid of this nuisance. I believe the repair bill will amount to about £2 10s. or £3. The dog was killed. (DR.) S. A. D'ARCY.

Clones, Co. Monaghan, Ireland.

[Our correspondent certainly can claim damages if the dog is known to be vicious.—ED.]

Sir,—I feel sure that the letter of Mr. F. W. Applebee in *The Motor Cycle* of May 23rd, with reference to the dog nuisance, will appeal strongly to every motor cyclist and indeed every cyclist also.

There is no doubt that the danger is a very tangible one, and when we consider that many valuable lives have been lost through either the aimless wandering or the vicious propensities of such animals over our roads, it is certainly time that the A.C.U. took some definite steps in regard to the matter. Of my own personal knowledge I can speak of weekly, often daily, spills occasioned to riders in this district (Dudley).

In my own case, with a twenty-five years' road experience, the majority of my spills have been due to the (in most cases) unnecessary dog. Some few years ago I was thrown from my Triumph by the deliberate charge of a large dog. I promptly gave the owner notice of my intention to sue him for all damages sustained, and he immediately paid up. All motor cyclists should adopt this course, and do as I should have done, if necessary—fight the matter in the courts at all cost. The governing bodies of the pastime seem too apathetic to take action.

Another phase of the question that has always puzzled me is why the fertile brained imposer of imperial taxes, who has set his seal upon the motor industry and its poor supporters has so utterly neglected so easily exploited a source of revenue. Is there any connection between this attitude and the huge number of mixed-breed curs one encounters in the land of "inteet to goodness, look you"? The tax ought to be at least one guinea per animal. This alone would rid our streets and roads to a large extent of the wholly unnecessary and undesirable cur. Hygienic reasons also ought to dictate a substantial depletion of their numbers.

Some definite action ought to be taken by the A.C.U., as it ostensibly caters for the needs of the motor cyclist in particular. In any event it would be useful if only that type of dog owner who lacks mental balance, and takes a demented delight in seeing his dog chase a motor cycle, could be brought to a clear understanding of what his position is.

SCARLET PIMPERNEL.

Weak Axles on Low-priced Sidecars.

Sir,—In your issue of 23rd May there is a warning against investing in cheap sidecars. This I heartily endorse. Last summer I fitted a cheap sidecar sold by one of the leading motor accessory houses to my 5-6 twin. After about three hundred miles use I fortunately discovered that the axle proper was quite loose, and on further inspection found that it was held in its socket in the tube member solely by a small pin, the brazing having given up the ghost. In another few miles it would undoubtedly have come adrift with possibly serious results. Truly a cheap sidecar is false economy.

"RIDING ON AIR."

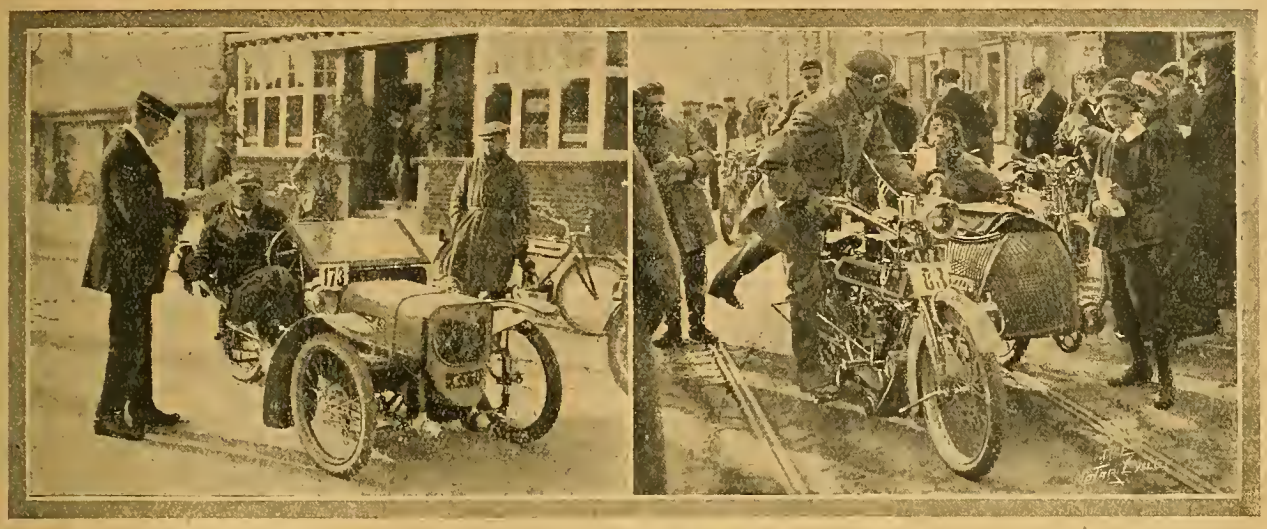
"More Comfortable than any car."

Such is the verdict of the

GLORIA

Sidecar.

We have prepared a booklet dealing interestingly with Gloria Sidecars—a postcard will bring you a copy post free.



CAMBRIDGE, April 23rd, 1912.

I am writing to tell you how delighted I am with the sidecar. My only two passengers tell me that it is more comfortable than any car, which is more than I have heard said about other sidecars. I myself have only had a short ride in it, but was very much struck by the smooth riding.

The combination steers perfectly with hands off. Your patent attachment appears to set the bicycle in an upright position without any adjustment. And so I remain more than satisfied.

(The original can be seen at our offices.) "_____"

Gloria Cycle Co., Ltd., Coventry.

M.C.C. ANNUAL LONDON-EDINBURGH RUN.

H. F. S. Morgan (8 h.p. Morgan runabout), the first cyclecar driver to arrive in Doncaster.

R. E. Guest (8 h.p. Matchless sidecar) leaving the Doncaster check. This private owner has been most successful in competitions of late.

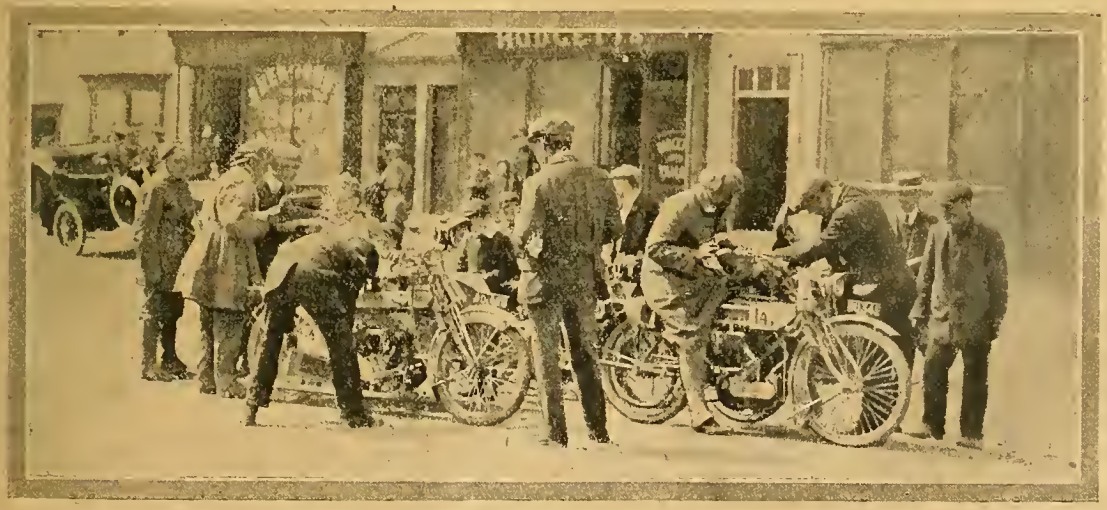
Pro Bono Publico.

Sir,—Have you ever noticed that M.C.C. (Motor Cycling Club) could also stand for "*Magna Cum Cura*"? (with great care), which might insinuate that every trial and all arrangements made and conducted by the M.C.C. are done *magna cum cura*—which I believe is the case—and other motor cyclists will agree with me.

T. NORMAN BROWETT.

Power Required for Sidecar Work.

Sir,—I notice in a recent issue of *The Motor Cycle* the various opinions expressed as to the power necessary to drive a sidecar combination, and must say I am very much surprised at the poor opinion two of your correspondents hold in respect to the ubiquitous 3½ h.p. model when used for this purpose.



I ride a 3½ h.p. Triumph, with two speed gear, geared at ratios of 5 top and 6⅞ bottom (which you will admit are not very wide ranges, neither is the bottom ratio a low one by any means), and yet I can go anywhere with this combination, of course within reason, and have never had either to pedal or shed the passenger.

I am not writing my experiences after a few miles running extending only one season. I am giving a long and varied experience, covering thousands of miles over all roads, good, bad, and indifferent, chiefly covered in the South of England, where the roads are by no means level, and yet I have never wished that my machine was an 8 h.p., or anything like it.

As an example of the reserve of power in my machine, I would instance such runs as Eastbourne and back on top gear, which I did only the other day, also to Brighton, and in fact any road with a gradient up to 1 in 15 can be taken on the top gear, and with the low gear I have yet to find a main road hill I can't climb, and when I say I frequently travel on the Hastings Road, which incorporates River Hill a 1 in 9.9 gradient at the bend, and a mile long, I think I need not have much fear in this respect. Only the other day (Whit-Monday) I thought I had discovered its "Waterloo" by undertaking the ascent of the road from Folkestone Harbour up the Leas, a gradient which, I think, must be quite 1 in 7, if not less, but I ascended two up quite comfortably. I do not say there are no limits to a 3½ h.p. machine, because there undoubtedly are, but what I will say is that from my own personal experience, which I think can easily be endorsed, this type of machine, with a two or three speed gear, will take a sidecar anywhere in reason, with two up, at an easy average of twenty miles an hour.

J. SUMMERS.

Sir,—I am afraid that the views of some of your lucky correspondents who can afford 8 h.p., two or three speed outfits costing £80 or £90, are needlessly discouraging to others who can only afford, say, a third of that sum. I only paid £22 for my machine at Robertson's. It is a 1910 3½h.p. twin

LONDON-EDINBURGH RUN.

Signing the control sheet at Northallerton, Yorks. The competitors are F. Smith (Clyno) and J. J. Day (3½ h.p. Bradbury.)

Peugeot with single gear, and it does not look so pretty as when its career began, but it pulls my sidecar and passenger nearly anywhere. It has climbed the north side of Brockley Hill with self (eleven stone seven pounds) and passenger (twelve stone) on a 5½ to 1 gear without assistance. It will touch 35 m.p.h. on the sprint, so we need not take the dust of many cars. I am thoroughly satisfied, and am seriously thinking of lightening my machine by discarding the pedal gear, for which I have very little use.

LE 2684.

Sir,—I purchased a 1911 model two-speed Humber motor cycle at Whitsun last year and have had no mechanical troubles since, although I have done over 3,000 miles in this neighbourhood, mostly with a sidecar (not by any means a flat country, as you know), including one or two long tours, namely, *viâ* Lyme Regis and the coast road to Bournemouth, Southsea, Brighton and back. On this occasion my brother accompanied me, and we took enough luggage for a fortnight's holiday.

Some months ago I had the engine down and what little carbon there was was removed, and, as an example of Humber reliability and the power developed by their 3½ h.p. engine, I am pleased to say that recently I climbed Haldon Hill with a passenger eleven stones and myself twelve and a half stones, total weight all up over 6 cwts.

The hill rises 780 odd feet in a mile and two-fifths, and has gradients of 1 in 7, 1 in 9, and 1 in 11, and a few yards below the summit is 1 in 13. The engine is geared 4½ to 1

C. W. Mayer and his 3½ h.p. Humber sidecar.

on top and 9 to 1 on bottom. The hill has a very nasty hair-pin bend about a hundred yards from the bottom and at the steepest part, and the whole road is one of continuous corners, but the engine simply romped round the bends, and we kept up a speed of seventeen miles an hour all the time, excepting at the hair-pin bend, which we took at fifteen miles an hour (by Smith speedometer), and, in spite of such a grind uphill, the machine got into high gear at the top of the hill and went away without any suspicion of knocking.

I may say that when we started for the climb the weather was hot and muggy, and I did not believe we should be successful, but the way the untuned engine roared up was simply—well, "marvellous"; that sums it up.

My passenger was very sceptical at the commencement, but he admitted that he had had an eye-opener this time. I am so pleased with my 1911 model that I shall leave well alone and not trouble about getting a 1912 machine as I intended doing.

I need scarcely add that I have no commercial interest in the firm whatever, but write as a satisfied customer.

CHARLES W. MAYER.

Sir,—Taking into consideration all that has been written against the 3½ h.p. combination, I think a good deal of injustice has been done to it. I myself, who am only able to motor cycle at week-ends and holidays, wanted an inexpensive running mount. My friends said, "Get a 6 or 8 h.p., or you will always be walking up hills." Others said the same, only with a speed gear and so on, until at last I began to think of giving up the pastime, as I could not afford a £70 or £80 turnout, and did not much care about riding alone (clubs, I consider, are not for the pleasure-seeker). However, before giving it up, I was determined to give my 3½ h.p. (1911) a trial with a sidecar, with the result that I can climb any ordinary hill with as much speed as any reasonable being wishes. I have ridden now with the combination over 2,000 miles, and have never experienced mechanical trouble, but have had punctures galore (I am going in for a steel-studded back tyre when my present one has expired). Taking all in all, I am perfectly convinced that a 3½ h.p. and sidecar is "It" for those who are in the same position as myself, provided they have a two or three-speed gear (and a good one at that), with a light but strong sidecar. One might compare us with a 15 h.p. car, and the powerful Enfield, Matchless, Zenith, and Indian, etc., with the beautiful 50 h.p. Rolls-Royce, Daimler, or Napier. They all go well, and you can get practically the same pleasure from all, except that one is like dropping half-sovereigns as you ride along and the other sixpences—but you only get the same result.

My contention is that if you live, or are continually riding, in such counties as Devonshire and Somerset, or in Wales, you must have a good 6 h.p. with a three-speed gear, but if only a week-ender, do not waste money, as the 3½ h.p. will do all you want of it. Those who are hesitating on account of this unsettled question do not know what they are losing. Finally, treat a motor cycle well, and like a horse—it pays you in the end.

KNIGHT OF THE ROAD.

[A number of other letters on this subject are unavoidably held over until next week.—ED.]

Petrol Consumption.

Sir,—With reference to the report in a recent issue of the Oxford M.C.C. consumption trials, it would be interesting to learn from Mr. Askew and the other competitors the make of carburetter fitted and any adjustments or special fakes used. In these days of dear petrol the poorer brethren amongst us would be glad of a tip. I find an average of 90 m.p.g. for a 3½ h.p. is about the most. With respect to "J.G.B.'s" query *re* Fafnir, governed on the inlet, it is a wonder to me that this engine is not more used. I have had one in use for many years, and it seems as good as new. The mileage must be over 30,000. W.L.B.

A Magneto Experience.

Sir,—May I be permitted to state a little experience which has happened to me this week, and which, if published, may be borne in mind by other motor cyclists when they are perplexed on account of misfiring by their engine from a cause most elusive to trace. In no book of hints, either by the cycle manufacturer or the magneto maker, did I find this referred to.

I was troubled with misfiring and endeavoured to trace it. I changed plug, dismantled contact breaker of magneto, cleaned and adjusted points, took down carburetter, blew out petrol pipe, and cleaned jet. Still the misfiring continued. I took out plug again, connected it to cable from magneto, pedalled machine, and got, what appeared to be, a good spark. I set points of plug a little closer and cleaned it well. Misfiring still continued. Now I unscrewed carbon holder of magneto, and, behold, the carbon was missing! The spring holder was still there, and this was, evidently, in occasional contact with metal segment of slip ring, and so accounted for the mysterious misfiring.

To get up the carbon was the next job—it was lying at the base of magneto. I elicited the help of a mechanic, who, with dexterous manipulation of a piece of rag, pushed round the ring by a bent spoke, was able to get hold of the naughty carbon. This, instead of being its proper length of 1¼in., or thereabouts, was only ½in., so I concluded that by reason of its being so short it was not firmly held against slip ring by the spring, and hence being slackly held had shaken out of the spring holder and dropped down. Moral: Periodically examine carbons to see they have not worn too short, and always carry a spare one. F. L. WHEELER.

Just Glance at this Map!

It tells its own Story.

6 GOLD MEDALS

M.C.C. London—Edinburgh Trial.

Five Royal Enfields competed: four 2¾ h.p. two-speed and Free-engine models—one 6 h.p. Sidecar combination.

All Qualified for Gold Medals.

Two of the above machines also competed in the return journey and finished successfully without trouble or mishap. The sidecar machine carried the driver and two passengers for a considerable part of the way.

These consistent successes of Royal Enfields are worthy of the famous "made like a gun" machines. For Speed, Silence, Flexibility, and Absolute Reliability, the Royal Enfield has been justly termed "the most perfect motor cycle ever produced."

In answering this advertisement it is desirable to mention "The Motor Cycle."

Salisbury to Exeter.

Sir,—I believe that the usual route between Salisbury and Exeter is *via* Shaftesbury, Yeovil, Chard, and Honiton. May I suggest an alternative, and, to my mind, an infinitely better, one, viz., Shaftesbury, Wincanton, Sparkford, Langport, Taunton, Wellington, and Cullompton? Although only a few miles further, the difference in gradients is remarkable. The severity of the former route has often been recorded in *The Motor Cycle*. The latter contains nothing on the down journey beyond Shaftesbury that even a push-bicycle cannot mount with comparative ease, and on the return trip a fifty yard pitch out of Langport and Shaftesbury Hill (on both routes) are the only gradients worthy of the name. WESSEX.

Should Ladies Race?

Sir,—Permit me, as one who has done a fair amount of motor cycling, to reply to your editorial on ladies riding in hill-climbs. When a lady enters for this type of competition, she thoroughly understands the risks she runs. Why this outcry when she is prepared to take them for sheer love of the sport; and the few ladies who at present enter for hill-climbs are quite as capable as the average male competitor. (Mrs.) MABEL HARDEE.

Sir,—I was sorry to read your recent leaderette "Should Ladies Race?" My personal opinion is, provided the lady has sufficient nerve and confidence, there need be no fear of her coming to grief. One must realise that in almost every sport there is a certain amount of risk. One hears little or nothing of the accidents that occur to expert motor cyclists at almost every race meeting, but because a lady has been unfortunate enough to have a spill, it seems as if the whole community are against ladies racing. It would be interesting to have other lady motor cyclists' opinions.

(Miss) LOTTIE BEREND.

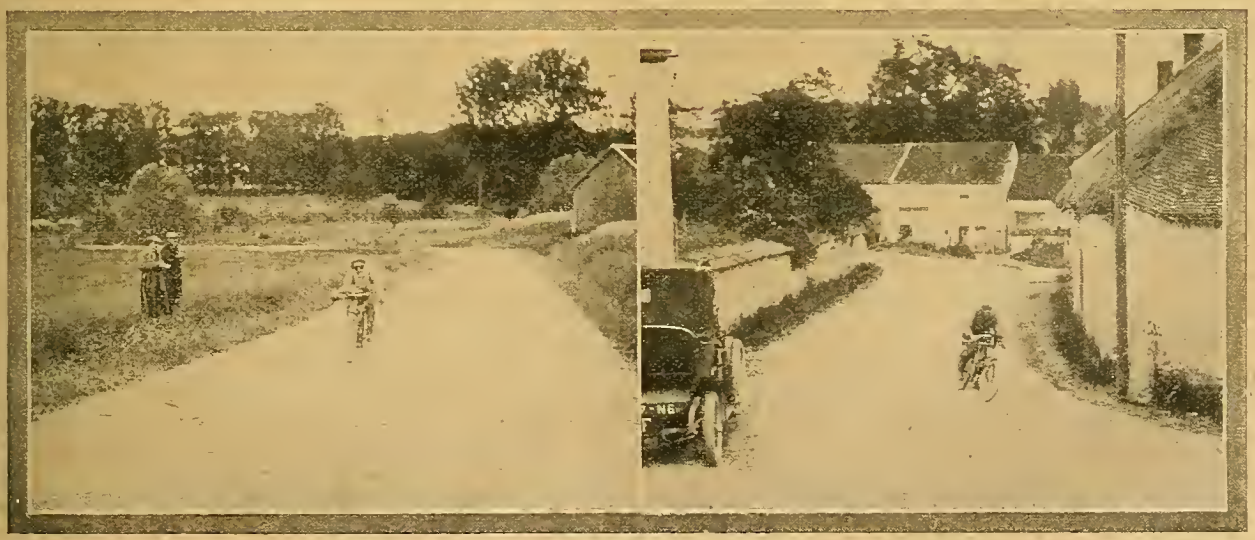
Sir,—Should ladies race? Certainly not! Anything more exciting than pushing a perambulator should be instantly suppressed. No wonder Mr. Stiggins of *The Motor Cycle* can find many supporters to his views. Who *would* not applaud such laudable sentiments?

As to the appearance of the lady competitors, can they be worse than that of some of the men? We have all seen men at hill-climbs wearing garments that, if not exactly hideous, are certainly most—unladylike. We, poor souls, cannot have a mild spurt or an occasional fall without calling forth reams of protest as to our lack of self-restraint. Surely he must have noticed that the type of lady that competes in speed contests does not indulge in hysteria, but perhaps he has been too busy watching the spread eagle effect to observe anything so trifling. If he dislikes to see ladies riding (I should say women, for, of course, no lady would want to ride), why does he not stay at home? He might while away his time helping with the housework, or, failing that, a periodical that I am certain would afford him interest is "The Sunday School Recorder," but no doubt he is already familiar with that. At any rate, please let him refrain from writing on us—may I say?—sportswomen; his remarks make us so tired.

(Miss) MAY WALKER.

Improving Mackintosh Leggings.

Sir,—In your issue of May 30th, page 585, I notice "Ixion's" comments on improving mackintosh leggings. Personally, I consider these most unhealthy, and have improved them out of existence, having for many years past worn either Burberry garments (which are rain but not airproof), or else a similar material known as Gaberdine, built into overalls by my own tailor. These, far from splitting at the first time of mounting, will last out two years' hard wear, and even then be good enough for occasional use. I get them made so that they can be pulled over a reasonably large shoe (personally I wear No. 9's of generous width) and I do not find it necessary to have any clips or buttons up the side of the calf. This does away with all stooping over to fasten same.



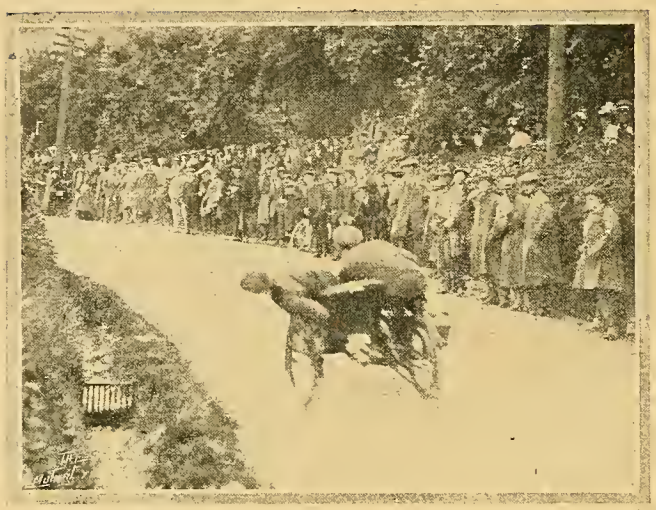
As to the leather straps under the instep, I have long ago abandoned these, and instead have sewn on a double thickness of stout flat elastic band (known as garter elastic. *Honi soit qui mal y pense*) which gives to the boot when pulled over, and then holds the spat down neatly over the shoe in a way no leather could be expected to. In addition to this, the elastic wears almost as long as the overalls, and can be easily replaced, whereas leather, from continual soaking and drying, soon rots. VAGRANT.

Road Conditions between Kew and Richmond.

Sir,—I have read with interest of the feats of the experts in climbing Honister and other "impassable" (?) tracts of road, but in my own humble opinion I have beaten all these records. I am the proud possessor of one of the ancients—to wit, an accumulator ignition Rover, B.C. 1906—and have on this machine ridden over the London Road between Kew and Richmond, only having been thrown off the machine once. I passed in safety half a mile of road (?) outside Kew Gardens with holes four to five inches deep every foot or so, but near the gates I fell into a pit, being hurled clean off the bicycle. Truly Surrey is a great county!

INJURED ANCIENT.

[We should advise our correspondent to communicate with the R.A.C. to bring pressure to bear on the authorities concerned.—Ed.]



LE GRAND PRIX DE CHAMPAGNE FOR MOTOR CYCLES.

(1) Stoffel (Alcyon) at speed in Le Grand Prix de Champagne for motor cycles. (2) Espanet on a Magnat-Debon.

HILL-CLIMB AT HARLEY BANK.

Well-organised Event held by the Birmingham M.C.C.

Full speed at the bend. F. W. Barnes (Zenith sidecar) with P. Weatherilt as passenger.

WENLOCK Edge presented an animated appearance on the 1st inst., when the Birmingham M.C.C. ran off their open hill-climb at Harley Bank. The finishing tape was wisely brought down the hill some little way to give competitors an opportunity of slowing up before the corner near the top of the hill. This point is worth noting. All the arrangements were excellent and the programme was expeditiously carried out, while there were no untoward incidents to mar the afternoon's sport, though there was plenty of dashing and skilful riding. H. C. Newman, J. Woodhouse, F. W. Barnes, D. C. Bolton, and H. Reed being most conspicuous.

There was thunder about, and it looked very stormy, but the rain held off till the competition was over, with the exception of a few drops between four and five o'clock, but made up for it later, as by seven o'clock it had set in for a wet evening.

The formula recommended by *The Motor Cycle*, $\frac{C \times t^2}{W}$, was used.

CLASS I. Lightweights up to 350 c.c.—F. Ball (2¾ Douglas) made fastest time, with F. W. Barnes (2¾ Zenith) and P. W. Owen on a similar machine second and third. F. G. Edmond and V. Busby came up well on the little 2 h.p. Humbers, but J. St. John failed. H. C. Newman was using the Brampton gear, described on page 610, on his Ivy-Precision, and spoke of it in most complimentary terms. He also used it at Leathley Bank with success.

CLASS II. Touring singles between 350 and 560 c.c.—This class produced some excellent riding, H. C. Newman (3½ Ivy-Precision) made fastest time, J. Woodhouse (Regal-Precision) was second, while T. Pollock (3½ James) and C. T. Newsome (3½ Rover) tied for third place.

CLASS III. For ladies.—There were only two competitors in this class, and, as might have been expected, Miss M. Hind (6 Rex) made fastest time, but Miss C. L. Butterfield went up very well on her 2¼ Levis; in fact, this little machine and the 2½ Levis ridden by H. Newey created a very good impression. The latter especially had a very healthy bark.

CLASS IV. T.T. lightweights (1912 regulations).—As in Class I., F. Ball (2¾ Douglas) was fastest, with P. W. Owen (2½ Zenith) and J. J. Woodgate (2½ Singer) second and third. H. V. Colver (2¾ Enfield) came up well, but changed gear near the top.

CLASS V. Senior T.T. machines (1912 regulations) up to 500 c.c.—H. C. Newman again made fastest time. D. C. Bolton, whose red Rudge arrived on the step of a Rolls-Royce, where special fittings were arranged for it, was second and J. Woodhouse (3½ Regal-Precision) third.

E. Winkle (Rollo cyclecar) approaching the bend.

CLASS VI. Racing machines, unlimited.—F. W. Barnes (8 Zenith), who was very fast on the straight and careful at the bend, made fastest time. H. Reed, whose 8 Dot carried sidecar fittings, was second, and H. C. Newman (3½ Ivy-Precision) third. D. C. Bolton (3½ Rudge) and H. Newey (2½ Levis) came up excellently.

CLASS VII. Single-cylinder sidecar machines.—The speed of the machines in this class was really extraordinary, F. W. Barnes (3½ Zenith sc.), H. C. Newman (3½ Ivy-Precision sc.), and J. Woodhouse (3½ Regal-Precision sc.) making fastest time in the order named. P. Platt had not forgotten to oil his Bradbury, and we were nearly choked by the smoke.

CLASS VIII. Twin-cylinder sidecar machines and cyclecars.—Fastest time was made by H. Reed (8 Dot sc.). F. W. Barnes (6 Zenith sc.) was second, and the Rollo cyclecar, driven by E. Winkle, which came up nicely but did not seem to be nearly so fast as the sidecars, was third.

There were numerous spectators to witness the sport. The hill was efficiently patrolled by the Shropshire Constabulary, assisted by Boy Scouts. There was very little traffic to interfere with the proceedings. We were glad to hear in Much Wenlock that Miss Hough was so far recovered from her fall a fortnight ago that she was able to leave hospital.

T. Silver (Quadrant) hugging the corner. Most of the older hands negotiated the bend in this fashion.

ENGLISH-DUTCH RELIABILITY TRIAL.

THE BRITISH TEAMS.

FROM time to time we have published particulars of the English-Dutch International Reliability Trial, organised by the Dutch Motor Cycle Club, together with a list of those who had entered. Great enthusiasm has been shown throughout, and there must inevitably be many disappointments, as there are to be only three competitors in each class and two reserves. It will be remembered that the English teams were to be chosen by ballot, committees of the leading motor cycle clubs being invited to aid in the selection of a representative team. Twenty-two clubs have voted, and the results given below may be considered as final, as there are only two clubs who applied for lists of entrants who have not voted. These, however, must be relied upon to settle the tie which occurs in one instance.

The selections are given below, and form a very representative team. In each case the number of votes recorded in favour of the rider is given after the name.

PRIVATE OWNERS.

CLASS A.—Up to 350 c.c.

	Votes.
Geoffrey Smith (2¾ Humber)	21
C. Maurice Down (2¾ Enfield)	15
F. A. Hardy (Norton)	9
or F. C. Wasley (2¾ Douglas)	9
Reserve :	
J. C. Bennett-Mitchell (2¾ Douglas)	6

CLASS B.—340 to 500 c.c.

Vernon Taylor (3½ Rudge)	20
Fred Dover (3½ Premier)	16
E. Lester (3½ P. and M.)	10
Reserves :	
Seymour Smith (3½ Norton)	9
A. E. Uffleman (3½ Humber)	9

CLASS C.—500 to 1,000 c.c.

W. Cooper (3½ Bradbury)	19
W. O. Oldman (Bat)	13
C. W. Wilson (Morgan runabout)	12
Reserves :	
H. C. Few (5-6 Clyno)	9
G. B. McKechnie (8 Dot-Jap)	8

Two ladies have signified their intention of accompanying the party : viz. : Mrs. A. Wade (3¾ Scott) and Mrs. C. C. Cooke (3½ Triumph).

TRADE TEAMS.

CLASS A.—Up to 350 c.c.

	Votes.
W. W. Douglas (2¾ Douglas)	17
R. Holloway (2½ Premier)	13
Sam Wright (2¾ Humber)	10
Reserves :	
Rex Mundy (2½ Singer)	8
H. Graham Dixon (2¾ New Hudson)	8

CLASS B.—340 to 500 c.c.

W. F. Newsome (3½ Triumph)	20
W. Pratt (3½ P. and M.)	17
J. H. Slaughter (3½ L.M.C.)	11
Reserves :	
George Brough (3½ Brough)	8
F. C. North (3½ Ariel)	4

CLASS C.—500 to 1,000 c.c.

Frank Smith (5-6 Clyno)	20
F. W. Barnes (6 Zenith)	17
F. A. Applebee (3½ Scott)	10
Reserves :	
Hugh Gibson (3½ Bradbury)	7
W. H. Wells (7 Indian)	6

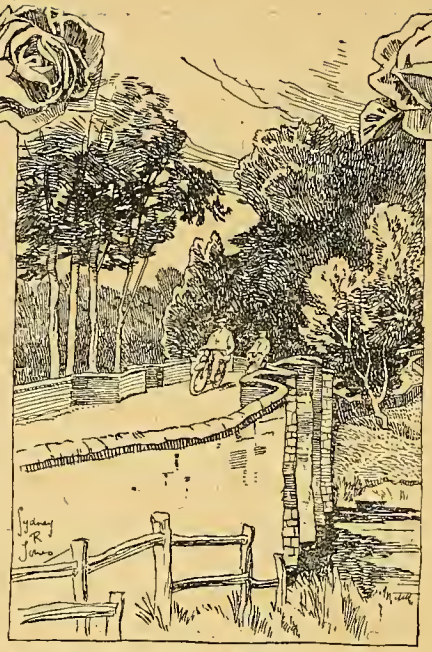
Maximum votes possible, 22.

The trial commences at 8 a.m. on Monday, August 5th, from Amsterdam, and the distance of the trial is approximately 160 miles. There is only one severe hill on the course, the "Grebbe," but we would advise competitors to take every precaution with their mounts, for the Dutchmen are keen and very careful. The trip, which is to occupy four or five days, will be an inexpensive one, and those who have not been chosen for the teams will do well to accept the Dutch Club's invitation to accompany the international team. Their performances will be checked and subsequently announced. Any trade entrant who has not been chosen and will not journey over to Holland may have his entry fee returned on application. Circular number plates as used in the T.T. will be issued to the team during this month.

We hear from Mr. Citroen, the Dutch Club secretary, who initiated the idea and who is in charge of the organisation, that the Dutch entries are coming in well. The Holland agents of the N.S.U. Co. have entered Gassert, the T.T. rider, for the Dutch team.

AUTO CYCLE UNION NEWS.

THE CHAIRMAN OF THE COMPETITIONS SUB-COMMITTEE.—The Rev. E. P. Greenhill has been elected chairman of the Competitions Sub-committee of the A.C.U. for 1912.



T.T. RACES OFFICIALS.—Subject to confirmation by the General Committee of the Union, Captain D. F. Nicholl, R.A., has been appointed judge for the Tourist Trophy Races, and Major F. Lindsay Lloyd, R.E., and the Rev. E. P. Greenhill assistant judges. These gentlemen will be aided in their duties by an examination committee of which Captain H. E. Davidson, R.E., has been invited to act as chairman, who will report to them the results of their examination. Messrs A. V. Ebblewhite and F. T. Bidlake will be the timekeepers, while Mr. Ebblewhite will also act as starter. The clerk of the course will be Mr. J. R. Nisbet, who so efficiently filled that office last year.

REGULATIONS AFFECTING PERMITS FOR OPEN HILL-CLIMBS.—Further to ensure the safety of both competitors and spectators at open hill-climbs, it has been decided that no permit will be granted when the hill chosen is not safe in the opinion of the Competitions Committee, and no permit will be granted if more than one competitor at a time is started up the hill. A special form to be filled in by clubs applying for permits will shortly be got out, and permits will only be granted if the rules are sent with the application and the hill chosen is stated.

FLEXIBILITY HILL-CLIMBS.—The A.C.U. will in all probability organise one or more flexibility hill-climbs, of which details will be published at a later date. The outline of the scheme is that the machines will be divided up into classes, only the top speed will be used, and the gear ratios to be employed in each class will be decided on. The slowest machine in each class will be adjudged the winner.

THE M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.—Mr. I. B. Hart-Davies has been invited to act as judge nominated by the A.C.U. for this competition to take place in Northants on June 15th.

CURRENT CHAT

TIME TO LIGHT LAMPS.

June 6th	... ...	9.9 p.m.
,, 8th	... ...	9.11 ,,
,, 10th	... ...	9.13 ,,
,, 12th	... ...	9.14 ,,

Annual T.T. and Summer Number.

On Thursday, June 27th, one day before the Junior T.T. Race, a special T.T. and summer number of *The Motor Cycle* will be published.

London-Coventry Trial Results.

A. C. Robbins (3½ h.p. Humber and sidecar) was the actual winner of the special prize for best performance by a member of the N.W. London M.C.C. in the open class, not J. R. Haswell as stated last week.

The Arthur Moorhouse Memorial Fund.

W. Pratt advises us that the following donations have been received by him since the publication of the last list :

R. M. Marians ...	... £1	1	0
F. W. Barnes ...	... 1	1	0
J. J. Wheeldon	... 1	1	0

M.C.C. Team Trial.

The Streatham and District M.C.C. and the Leicester M.C.C. have decided to send teams for the above club championship event for *The Motor Cycle* cup on June 15th, bringing the total to twenty-six. Competitors must report themselves to the chief marshal by or before twelve o'clock at the Wheatsheaf Hotel, Daventry. The competition will start at 1 p.m. sharp, so there will be no time to waste with such a host of competitors. The list of entries as it at present stands is given below :

Bedfordshire and District M.C.C.
Birmingham M.C.C.
Bristol M.C.C.
Bristol C. and M.C.C.
Derby and District M.C.C.
Coventry and Warwickshire M.C.
Essex M.C.
Herts County M.C.C.
Liverpool M.C.C.
Luton and South Bedfordshire M.C.C.
Mersey M.C.
Motor Cycling Club.
Northants M.C.C.
Norwich and District M.C.C.
Norfolk M.C.C.
North-west London M.C.C.
Nottingham and District M.C.C.
North Middlesex M.C.C.
Oxford M.C.C.
South Birmingham M.C.C.
Sheffield and Hallamshire M.C.C.
Sutton Coldfield and Mid-Warwickshire A.C.
Walthamstow M.C.
Wolverhampton M.C.C.
Streatham and District M.C.C.
Leicester M.C.C.

The above entries total twenty-six. Late entries will be accepted at £3 3s. up to Saturday next.

Notable Hill-climbing Feats.

"Spion Kop," Paignton, was recently climbed by Reg. Holloway on a standard 3½ h.p. clutch model Premier, with a sidecar attached, and taking as a passenger Mr. H. F. Benny (captain Torbay and District M.C.C.) The combined weight of rider and passenger was 21 stones 9 lbs., and the gear used 5 to 1. The hill is about two hundred yards long, and averages 1 in 4. This is believed to be the first clean ascent of the hill by a passenger combination.

Last week, W. F. Newsome, driving a 3½ h.p. 1912 single-geared Triumph and sidecar, took three passengers up Stoneleigh, the Coventry test hill, the combined weight being almost 40 stones.

SPECIAL FEATURES.

INCOMPLETE FOURTH STROKE.
FRENCH ROAD RACE.
HUB AND COUNTER-SHAFT GEARS.
SATURDAY'S COMPETITIONS
(Illustrated).

T.T. Fund.

Recent donations to the Tourist Trophy Fund are as under : Mrs. Schulte £3 3s., Miss Muriel Hind £1 1s., and the Coventry and Warwickshire Motor Club £2 2s.

Another Stolen Machine.

A 1911 free engine Triumph, engine No. 12,699, machine No. 173,321, fitted with a Cowey speedometer, and having a broken back stand, also a set of fawn overalls, were stolen from Stanley House, St. Andrews, Pollokshields, Glasgow, between six o'clock on Saturday, May 25th, and eleven o'clock on Sunday, May 26th. The owner, Mr. J. B. Wharrie, is offering £5 for information leading to the recovery of the machine.

T.T. News.

Messrs. Ebblewhite and Bidlake will, in all probability, take the times for the Junior and Senior T.T. races in the Isle of Man. The official hotel will be "The Sefton." As regards transport arrangements, both the Midland and I.O.M. Steam Packet Companies will endeavour, if possible, to accommodate the machines on the upper decks of the steamers, and everything possible will be done to render the transport of the machines as safe and as easy as possible.

HILL-CLIMBING EXTRAORDINARY.
After the London-Edinburgh Run, P. Platt, one of the successful competitors, drove his 3½ h.p. Bradbury up Nottingham Place, Edinburgh, a steep acclivity, with six passengers on board.

London-Edinburgh Run.

Two Hazlewood machines were ridden in the London-Edinburgh Return Journey Competition and both riders, A. Walsgrove and F. Begley, were successful in obtaining gold medals.

The Indefatigable Motor Cyclist.

Motor cyclists appear to be indefatigable. Several return journey men rode twenty or thirty miles home after finishing the London to Edinburgh run on Monday, the 27th ult.

Doncaster and District M.C.C. Reliability Trial.

The results of the trial on Whit-Monday are as follows: 1. F. H. Dunstan, lost no marks; 2, A. Stacey, lost three; 3, T. H. Dew, lost four; 4, J. A. Bassett, lost eight.

Inter-club Hill-climb at Oakamoor.

On Saturday next, the annual inter-club hill-climbing competition for the Bolton cup takes place at Oakamoor, Staffs. The contest is open to the following clubs: Derby and North Staffs. A.C., Mid. Staffs. A.C., North Staffs. M.C.C. and the Derby and District M.C.C. The climb commences at 12 o'clock.

T.T. Entries.

The N.S.U. Co. wish us to correct the statement that they have entered two machines for the Tourist Trophy races. Two N.S.U. machines have been entered by Gassert—one in the Senior race and one in the Junior—but this has been done entirely on his own account, the machines being in no way entered by the firm.

Flexibility Trial near Aberdeen.

The Aberdeen and District M.C.C. held a flexibility trial on the Slug Road on Saturday last. The winners were: 1, H. Millar (3 h.p. T. T. Matchless), 5.36; 2, G. F. Davie (3½ h.p. Rudge), 5.12; 3, J. Corby (3½ h.p. Triumph), 4.61; 4, W. Simpson (3½ h.p. Rudge), 4.45. There were fourteen competitors. The roads were in excellent condition, but the weather, though dry, was far from warm, and heavy banks of mist drifting up the sides of the hill did not help to improve matters.

G. Duller, a well known jockey, who is as much at home on his 8 h.p. Chater Lea-Jap as he is astride a racehorse.

FUTURE EVENTS

June 14 and 15.—Dublin M.C.C. Open 24 Hours' Reliability Trial.
„ 15.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP.
„ 28.—JUNIOR TOURIST TROPHY RACE.
„ 29.—North Middlesex M.C.C. Open 12 Hours' Reliability Run.
„ 29.—Mersey M.C. Open Hill-climb.
July 1.—SENIOR TOURIST TROPHY RACE.
„ 6.—Dublin M.C.C. Open Hill-climb.

A.C.U. Membership.

Nearly 800 names are down for election at the next committee meeting of the Auto Cycle Union.

The Second Mobilisation Test.

There is still a chance for any reader who desires to take part in the next mobilisation test on Sunday, June 9th. The scheme was explained by our military correspondent, "Celeriter," in the issue of May 16th last.

A Police Trap.

A correspondent informs us that there is a police trap working between Bristol and Weston-super-Mare. On entering Weston he was stopped by two policemen and asked for his licence, and informed that his time had been taken.

A Curious Offer.

We have before noted the unusual articles which are offered to our advertisers in exchange for motor cycles. A correspondent writes to say that he has been offered a complete set of fittings for a fish and chip shop, but as he is a metal merchant he does not think that the fish and chip business would combine well.

Some Contents of this Issue.

The results of the London-Edinburgh Run and also the time and formula winners in the Birmingham M.C.C. Harley Bank hill-climb appear in this issue, besides a description and illustrations of the Grand Prix de Champagne, and the British teams in the English-Dutch trial. Brief results of club competitions in all parts are also included.

Care and Despatch at a Hill-climb.

At the Birmingham M.C.C. hill-climb on Harley Bank 120 entries were run off in two hours and a quarter. The competitors and machines were weighed at the top of the hill immediately after each climb.

Nearly 100 m.p.h.

Under F.A.M. sanction, Ray Seymour, on a 7 h.p. Indian, at Los Angeles track, attacked records, and is credited with covering the first mile in 36⅘s. = 97.82 m.p.h., if confirmed the fastest speed ever accomplished on a motor cycle. He broke all records up to twenty miles, his average speed being 93¼ m.p.h.

Another Indian rider, Lon Claflin, succeeded in annexing all amateur track records from 1 to 17 m.

LE GRAND PRIX DE CHAMPAGNE FOR MOTOR CYCLES. (See next page.)
(1) Verifying the cylinder dimensions of Fenton's Triumph. (2) V. Taylor examining the interior of his engine.

Le Grand Prix de Champagne.

THE Motor Cycle Grand Prix was run off on Sunday last under bad weather conditions, and was chiefly noticeable for the troubles experienced by the English riders, only one of whom (Fenton, Triumph) completed the course. The course was in the neighbourhood of Reims. Dixon (New Hudson), after travelling about one kilometre, suffered a bad fall owing to his handle-bars coming loose; this was curious, as he had tightened them overnight; his fall occurred at about 55 m.p.h., and he cut his leg and hand rather badly. Cocker (Singer) was going well, but lost his compression tap. Vernon Taylor (Rudge) blew in the top of his piston. Berwick (New Hudson) blew off his cylinder head overnight, and though he obtained another machine for the race his back cover kept coming off the rim, and he was thus put out of the race, and Mundy (Singer), the remaining Englishman, had a seize after about six kilometres; surely never was there such a chapter of accidents.

The English team, however, were not the only ones to have trouble, for Fay (René Gillet) had his front wheel come out when travelling at close on a mile a minute. It is a marvel that he was not seriously hurt, but he was fortunate enough to escape with damaged knees. So much for the troubles.

The Alcyon and Peugeot machines were particularly noticeable for their fine and consistent running. Péan, who proved the winner, on a 2¾ twin Peugeot, averaged 41 m.p.h. throughout—a really wonderful achievement, seeing that some of the corners were so bad that the competitors were obliged to dismount and run round. He thus repeated his success in the Circuit de l'Eure. Gabriel was present to witness the race, but he is not yet recovered from a fall last week. Fenton rode Gabriel's new Triumph and finished first in the third category. Results:

CLASS I.—Up to 300 c.c.

		h. m. s.
1.	Franquebalme (Terrot)	3 19 24
2.	Cuzeau (Terrot)	3 22 40
3.	Schwab (Terrot)	3 36 43

CLASS II.—Up to 350 c.c.

		h. m. s.
1.	Péan (Peugeot)	3 7 53
2.	Lacroix (Peugeot)	3 14 43
3.	Desvaux (Peugeot)	3 32 29

Cuzeau (Terrot), rounding one of the numerous bends on the course. He finished second in Class I.

CLASS III.—Up to 500 c.c.

1.	Fenton (Triumph)	3 10 3
2.	Naas (Griffon)	3 18 4
3.	Bloch (René Gillet)	3 28 34

GENERAL CLASSIFICATION.

1.	Péan (Peugeot)	3 7 53
2.	Fenton (Triumph)	3 10 3
3.	Lacroix (Peugeot)	3 14 43

Vernon Taylor on the T.T. Rudge, though experiencing trouble, managed to accomplish by far the fastest lap, his time being 34m. 20s. = 52.51 m.p.h. For this performance he annexes the Coupe Hanriot offered for the fastest circuit.

T.T. ENTRIES TO DATE.

THE following is a list of entries for the T.T. Races. In addition to those enumerated, up to the time of going to press, there are twelve provisional entrants in the Senior and six in the Junior races, who had not paid their entry fees. T. Steele cabled his entry from Johannesburg:

THE SENIOR EVENT.

J. R. Haswell (3½ Triumph)
J. R. Alexander, jun. (3½ Indian)
H. H. Bowen (3½ Dot)
N. F. Holder (4 Blumfield)
S. C. Perryman (4 Blumfield)
L. B. Hart-Davies (3½ Triumph)
F. A. Applebee (3½ Scott)
Hugh Mason (4 Matchless)
J. A. Hoffmann (3½ Triumph)
F. Philipp (3½ Scott)
Blumfield, Ltd. (4 Blumfield)
C. B. Franklin (3½ Indian)
D. C. Bolton (3½ Rudge)
Quintin Smith (3½ Triumph)
C. R. Martin (3½ Triumph)
P. W. Owen (3½ Norton)
J. R. Hayes (3½ Cayenne)
Karl Gassert (3½ N.S.U.)
Alister Kirk (3½ Triumph)
G. Griffith (3½ N.S.U.)
Paul Schmidt (3½ N.S.U.)
C. S. Franklin (3½ N.S.U.)
A. H. Alexander (3½ Indian)
H. Petty (3½ Singer)
J. L. E. Emerson (3½ Norton)
T. Steele (4 Rex)
J. Gibson (3½ Trump-Jap)
Cleveland Motor Cycle Co. (Cleveland)
W. H. Huckle (3½ Zenith)
J. W. Adamson (3½ Triumph)
Allen S. Jones (3½ Rudge)
W. Jones (3½ Rudge)
J. Woodhouse (3½ Precision)
H. A. Collier (4 Matchless)
C. R. Collier (4 Matchless)
J. F. Sirette (3½ twin Indian, 70×54.5 mm.)
Cleveland Motor Co. (one Cleveland)

THE JUNIOR RACE.

P. J. Evans (2¾ Humber)
Hugh Mason (2¾ Newcastle)
S. L. Bailey (2¾ Humber)
H. Petty (2½ Singer)
J. H. Watson (2¾ Humber)
D. M. Brown (2¾ Humber)
Karl Gassert (2¼ N.S.U.)
J. Stewart (2¾ Douglas)
J. I. Walker (2½ N.S.U.)
J. Kerr (2½ N.S.U.)
Harold Cox (2¾ Forward)
E. Kickham (2¾ Douglas)
H. J. Beal (2½ N.S.U.)
A. E. Woodman (2¾ Humber)
J. Haslam (2¾ Douglas)
Robert Ellis (2¾ Nut)
H. C. Newman (2½ Precision)
Rex Mundy (2¾ Singer)
Vernon Taylor (2¼ O.K.)
D. R. O'Donovan (2½ Singer)

T.T. FUND.

Donations to the Tourist Trophy Fund have been fairly numerous up to the present, but as the expense to the A.C.U. is a very heavy one, further aid is desired.

M.C.C. LONDON TO EDINBURGH AWARDS.

THE following awards were officially given out by the Motor Cycling Club after the committee meeting on Monday night. For the third year in succession, G. Brough has won the Motor Cycling Club Challenge Cup for covering the outward and homeward journeys most closely to schedule time—a marvellous performance. The cup now becomes the property of the holder:

MOTOR CYCLING CLUB CHALLENGE CUP: Error.

1. G. Brough (3½ Brough) 0
2. H. Karslake (3½ Rover) ... ... 1m. 5s.
3. A. C. Robbins (3½ Humber) ... ... 4m. 25s.
4. W. B. Gibbs (2¾ Douglas) ... ... 4m. 51s.

WELLS CUP, presented by W. H. Wells, and competed for by a motor cycle and sidecar entered for the single journey, under the same conditions as the above:

1. F. Smith (5-6 Clyno sc.) 0
2. W. Pratt (3½ P. and M. sc.) ... ... 1m. 49s.
3. H. Huckle (Zenith sc.) ... ... 3m. 14s.
4. W. A. Jacobs (6 Rex Sidette) ... 7m. 20s.

CLARK CUP, presented by R. O. Clark, and competed for by a motor cycle and sidecar entered for the double journey, under the same conditions as the above:

1. F. Smith (5-6 Clyno sc.) 0
2. A. Abbott (3½ Bradbury sc.) ... ... 2m. 29s.
3. T. G. Proctor (7 Indian sc.) ... 7m. 6s.
4. C. F. Halsall (8 Matchless sc.) ... 9m. 20s.

SINGLE JOURNEY GOLD MEDALS:

H. G. Bell (5-6 F.N.)
Commodore Sir R. K. Arbuthnot, Bt., R.N. (3½ Triumph)
D. S. Baddeley (6 Baddeley)
R. M. Marians (3½ P. and M.)
F. E. Wasling (2¾ Enfield)
W. Price (3½ Cleveland)

HARLEY BANK HILL-CLIMB RESULTS.

BELOW we give the first three competitors as determined by the formula in Saturday's Birmingham M.C.C. open hill-climb at Harley Bank, Wenlock Edge. The results are subject to confirmation by the committee:

CLASS I.

Rider and machine.	Time.	Fig. of merit.	Position. Time	Formula
F. W. Barnes (2¾ Zenith) ...	58⅘s.	312	2	1
P. W. Owen (2¾ Zenith) ...	59⅕s.	314	3	2
A. J. Dixon (2½ Singer) ...	64⅗s.	396	7	3

CLASS II.

H. C. Newman (3½ Ivy-Precision)	48s.	361	1	1
J. Woodhouse (3½ Regal-Precision)	50⅘s.	372	2	2
H. Reed (3½ Dot)	52⅘s.	391	7	3

CLASS III.

Miss M. Hind (6 Rex)	54⅔s.	830	1	1
Miss Butterfield (2¼ Levis) ...	101⅘s.	882	2	2

CLASS IV.

P. W. Owen (2¾ Zenith) ...	57s.	292	2	1
J. J. Woodgate (2½ Singer) ...	61s.	390	3	2
F. W. Barnes (2¾ Zenith) ...	65⅘s.	386	5	3

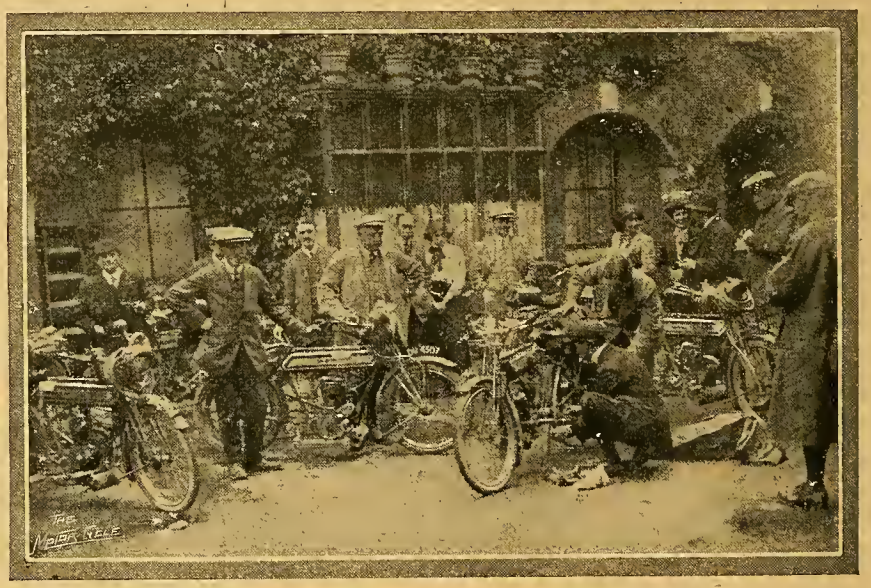
Rider and machine.	Time.	Fig. of merit.	Position. Time	Formula
CLASS V.				
H. C. Newman (3½ Ivy-Precision) ...	47s.	345	1	1
J. Woodhouse (3½ Regal-Precision) ...	50⅗s.	371	3	2
D. C. Bolton (3½ Rudge)	48s.	382	2	3
CLASS VI.				
P. Weatherilt (2¾ Zenith)	60⅖s.	354	11	1
H. C. Newman (3½ Ivy-Precision) ...	47⅗s.	360	3	2
J. Woodhouse (3½ Regal-Precision) ...	52s.	394	6	3
CLASS VII.				
J. Woodhouse (3½ Regal sc.)	73⅘s.	384	3	1
F. W. Barnes (3½ Zenith sc.)	68⅗s.	412	1	2
H. C. Newman (3½ Ivy sc.)	69⅗s.	445	2	3
CLASS VIII.				
F. W. Barnes (6 Zenith sc.)	64s.	521	2	1
F. H. Southam (6 Zenith sc.)	64s.	525	2	2
H. Reed (8 Dot sc.)	59s.	544	1	3

The best figure of merit was made by P. W. Owen in Class IV.

DINAS MAWDDWY CLIMBED.

Two Members of the Coventry Club accomplish the Feat.

ON Saturday last the fifth annual Welsh run organised by the Coventry and Warwickshire Motor Club took place, starting from Coventry at 7 a.m. The morning's route was to Lake Vyrnwy, the competitors journeying *via* Coleshill, and joining Watling Street at Weeford Corner, and then *via* St. George's, Shrewsbury, Alberbury, Llansaintffraid, and Llanfyllin to Lake Vyrnwy. *En route* a speed-judging competition was arranged, with the result that the motor cycle class was won by J. R. Haswell (two-speed Triumph sc.) Mr. Geoffrey Smith (2¾ Humber) took times at the secret check and at the finish, whilst Mr. E. J. Hardy, trials hon. sec., was the time-keeper outside Shrewsbury.



The following gained souvenirs for completing the run within five and a half hours: V. A. Holroyd (Rudge-Multi), C. T. Lloyd (6 Rex Sidette), J. R. Haswell (3½ Triumph sc.), A. Elson (4 Singer sc.), D. Elson (3½ Triumph), E. Martino (3½ Rudge), W. G. Blatch (3½ Rudge), A. Wright (3½ Triumph), A. N. Barrett (3½ Rudge), A. D. Arter (3½ James sc.), and W. F. Newsome (3½ Triumph).

E. A. Gorton (6 Rex Sidette) lost his souvenir by about two minutes, and reported he had stopped to chat with Miss Hind in Shrewsbury. B. S. Gorton (3½ Rex) was half an hour late, owing to a puncture and broken belt. E. A. Isherwood (Arden cyclecar) retired in the neighbourhood of Coleshill, as, unluckily, he lost the fan belt, and was not aware of the fact until the engine commenced to overheat. It took some time to have a new one made, so he resolved not to continue.

In the afternoon the members of the club (who, with the car party, numbered over fifty) attempted to climb the hill leading from Lake Vyrnwy to Bala. This hill has a gradient estimated to be in the neighbourhood of 1 in 4½, and rises 1,600 feet. A number of the machines were successful, including Holroyd's Rudge, Lloyd's Rex, Haswell's Triumph sc., Elson's Triumph, Barrett's Rudge, Arter's James sc., Newsome's Triumph, and Smith's 2¾ Humber. Continuing along the stony ridge on the side of the mountain, which is a route not recommended to be followed in a hurry or in the dark, the members journeyed to the Hand Hotel, Llangollen, the headquarters.

The Steepest Hill in Wales.

Next day the objective of the trip, namely, Dinas Mawddwy, was approached *via* Corwen and Bala. The easy side of Bwlch-y-Groes (known as Dinas Mawddwy) was a foretaste of what was to follow, and a number of the party came to a standstill. The hilltops were wrapped in mist, and at some points it was impossible to see twenty yards. Bwlch-y-Groes rises 1,750 feet in two miles, the gradient for long stretches being as steep as 1 in 4. It was intended to hold an impromptu hill-climb on the southern side, the prizewinner to be the one who got highest up, but when W. F. Newsome had reduced his gear to 6⅓ to 1 and made a clean ascent at the first time of asking, the competition idea was dropped. This was really a marvellous achievement, and is undoubtedly the first authenticated ascent of the mountain pass. Those who would like to study the achievement should refer to the Contour Road Book, Western Division, No. 34, pages 798-9. A number of members of the Merionethshire Motor Cycle Club had read of the Coventry Club's proposed onslaught on this hill, and had gathered to witness the fun, besides which two cars conveyed spectators to the hill. Most of the other members of the Coventry Club had a try, but all were doomed to failure except Sam Wright, whose 3½ two-speed Humber went sailing merrily up the hill in the same way that it annihilates every hill that comes within its path. He and Newsome, two veteran reliability trial riders and racing motor cyclists, deserve every credit for their fine performances. A. N. Barrett, a heavy rider of a 3½ Rudge Multi, was almost successful, but all the others were doomed to failure, which caused no surprise, as this hill, besides being so exceptionally steep, has a hairpin corner at the foot, and the surface is covered with loose stones. It is not an easy matter to steer a straight or comparatively straight course.

At Llangollen. Scene in the Hand Hotel yard.

The scenery on both sides of the pass is magnificent, and the members were amply repaid for their exertions. Newsome made a second ascent of the hill at our suggestion, keeping up a speed of from 15 to 20 m.p.h., and Sam Wright, feeling that he had so much in hand, attempted to carry a passenger seated on the carrier, but in this he was unsuccessful.

A. D. Arter (3½ three-speed James sc.) almost reached the gate, about ¼ mile from the summit; the three-speed 2¾ Humber and a Rudge Multi got to the gate, but there was a lot more 1 in 4 left.

Immediately the members had had their fill of mountain climbing it commenced to rain, and a ride home in the pouring rain, *viâ* Welshpool, Shrewsbury, and Coleshill, will long be remembered. Who will be the first to take a side-car and passenger up Bwlch-y-Groes (The Pass of the Cross)?

ANGLO-SCOTTISH HILL-CLIMB.

The above event takes place next Saturday, at 2.30 p.m., on Lauton Hill, near Jedburgh. A team of twelve riders nominated by the A.C.U., whose names are given below, will compete against twelve riders of the Edinburgh and District M.C. The results will be decided on time and formula.

The Anglo-Scottish event will be followed by an open hill-climb, and in the evening the English team will be entertained at dinner in Edinburgh by the Edinburgh Club.

SINGLE-CYLINDERS (500 c.c.)

W. F. Newsome (Triumph)	F. W. Barnes (Zenith)
J. H. Slaughter (L.M.C.)	T. Silver (Quadrant)
H. Berwick (New Hudson)	

MULTI-CYLINDERS (1,000 c.c.)

F. W. Barnes (Zenith)	C. W. Jameson (Matchless)
W. E. Cook (A.S.L.)	A. N. Other (——)
H. Reed (Dot)	

SIDECARS (1,000 c.c.)

F. W. Barnes (Zenith)	H. Berwick (New Hudson)

The Scottish team will not be definitely chosen until Saturday morning.

The Fourth Monthly Meeting of the B.M.C.R.C.

The 1,000 c.c. invitation car race. Gordon Watney's Mercedes car winning from C. R. Collier (Matchless) at 80 m.p.h.

THE fourth monthly meeting of the British Motor Cycle Racing Club was quite an interesting affair. The weather was close and rather threatening, and though there were several slight showers there was, fortunately, not enough rain to interfere with the racing.

Event No. 1 was the 500 c.c. invitation car race, open to the winners of the first and second prizes in the 500 c.c. car challenge race, held on May 12th. Distance, 3 laps (8 miles 269 yards). First prize, silver cup. In this and the other similar races, the car and cycle or cycles started about a quarter of a mile from the fork, and kept level with the B.A.R.C. car until the starter (Mr. A. V. Ebblewhite) dropped his flag, and then got away. The two competitors were G. E. Stanley (1 cyl. Singer, 85 × 88 mm., 499 c.c.) and G. C. Pullen (24 h.p. 4 cyl. Cameron, 3⅞in. × 4in., 3,047 c.c., air-cooled). At the start, Stanley got well ahead, but at the end of the second lap the car was leading. Pullen finished 5s. ahead of Stanley. Time, 7m. 22s. = 66.38 m.p.h.

Event No. 2 was the third 5 lap cyclecar handicap. Distance, 13 miles 1,035 yards. Ward (Bedelia) was given 4m. 10s. start of the other two. The A.C. had a boat-shaped racing body sharply pointed fore and aft. Before the races it was seen to climb the test hill on top speed, but during the event the gear, curiously enough, seemed too high for a fast speed. The Bedelia held first place for two laps, but the G.W.K. and the A.C. rapidly overhauled it, and in the third lap it retired, owing to a broken inlet valve. In the fourth lap the G.W.K., which was running in splendid form, had greatly increased its lead, and in the fifth finished first by about a quarter of a mile. Hill on the A.C. lost count of his laps, and covered one too many. Result:

1. J. T. Wood (2 cyl. G.W.K., 86 × 92 mm., 1,070 c.c.)
2. F. Hill (1 cyl. A.C., 95 × 105 mm., 723 c.c.)

Time, 17m. 23s. = 47.89 m.p.h.

The Car Again Wins.

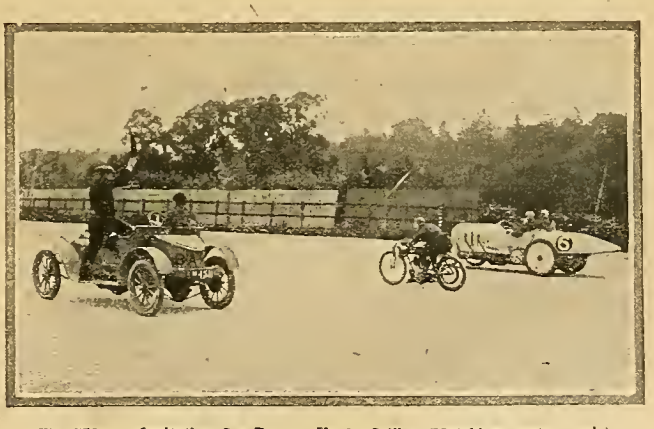
Event 3. The 750 c.c. invitation car race, open to the winners of first and second prizes in the 750 c.c. car challenge race, held on May 12th. Distance, 3 laps (8 miles 269 yards). First prize, silver cup. Printz and Collier easily left the car at the start. At the end of the first lap Collier maintained his lead, the car came second, and Printz stopped through plug trouble. In the last lap the car forged ahead hard by Aeropolis, and won by 250 yards. Result:

1. H. Petit (driving A. Lambie's 22.4 h.p. 4 cyl. Bedford, 95 × 95 mm., 2,694 c.c.)
2. H. A. Collier (2 cyl. Matchless-Jap, 85.5 × 64 mm., 741 c.c.)

Time, 7m. 32⅘s. = 64.9 m.p.h.

Event 4. The 1,000 c.c. invitation car race, open to the winners of the first and second prizes in the car challenge race, held on May 12th. Distance, 3 laps. First prize, silver cup. As in the previous car *versus* cycle races, the motor bicycle got away first, but this time the latter had no chance. The big Mercédès soon got ahead, and increased its lead each lap, winning by about threequarters of a mile. C. R. Collier recently had an accident, the result of which is still, unfortunately, affecting him. Result:

1. F. R. Samson (driving Gordon Watney's 48.6 h.p. 4 cyl. Mercédès, 140 × 150 mm., 9,237 c.c.)
2. C. R. Collier (2 cyl. Matchless-Jap, 90 × 78 mm., 998 c.c.)



Time, 6m. 33s. = 74.7 m.p.h.

The last event on the programme was the all-comers' hour race, for motor cycles with or without sidecars, the cylinder capacity of which does not exceed 1,000 c.c. Awards: The club's gold medal to the first to finish in Class B; the Alec Ross Cup, kindly presented by Mr. W. H. Elce, winner of the cup in the fifty mile T.T. race held on May 12th, to the first to finish in Class C; silver and bronze medals to the second and third; a silver medal to the first to finish in Class D. (There were no starters in Class D.)

The order in the first lap was: Stanley, Bailey, Woodman, Carter, Aitken, Hunter, and Wallace.

A Good Performance.

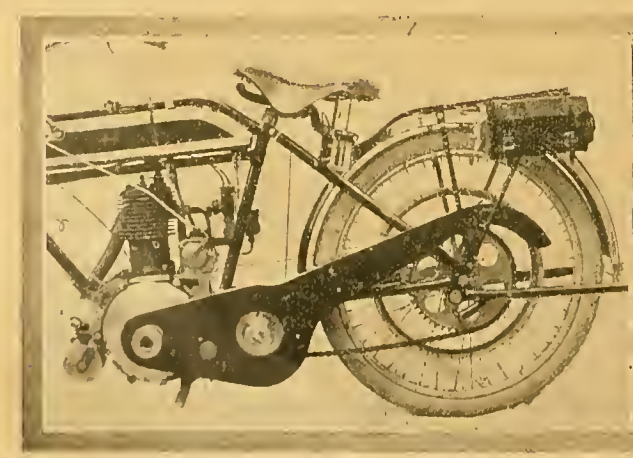
Stanley's Singer and Bailey's Douglas both ran magnificently; Woodman, as he passed on the second lap, threw down a spare belt which had come adrift. In the third lap Stanley, Bailey, and Woodman maintained the order they kept throughout the race; Wallace and Hunter dropped behind. Stanley steadily forged ahead, keeping up a speed of over sixty miles an hour. In the 11th lap he passed Bailey, and in the 18th lapped him again. Hunter, after his set back, made a gallant effort to regain lost ground, but the belt coming off three times and petrol feed trouble prevented him from making a star performance. He had two Wakefield oil tins in the sidecar, the contents of which his brother transferred to the oil reservoir by the vigorous appli-

The 750 c.c. Invitation Car Race. H. A. Collier (Matchless motor cycle). R. L. Printz (Bat-Jap), and A. Lambie's 22.4 h.p. Bedford car starting.

Start of the All-comers' Hour Race.

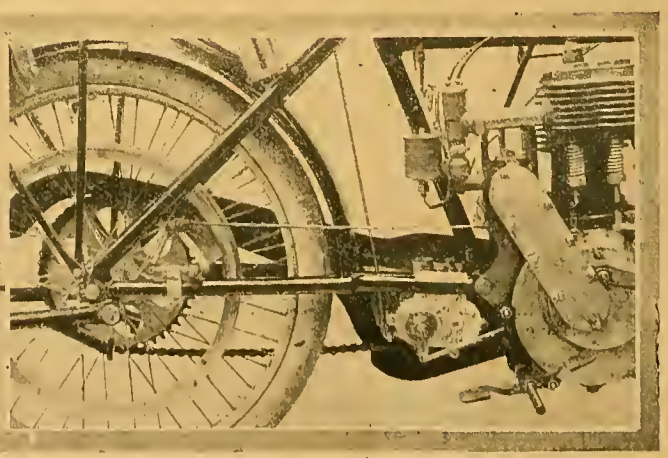
cation of tyre pumps fixed to each. Woodman, who rode splendidly, slowed rather in his 12th lap, but picked up afterwards. Bailey, who made such a fine showing on the Douglas, is an Australian, who has been only six months in England. He rode W. Douglas's competition machine, whose engine buzzed like that of an aeroplane the whole time and never faltered once. Result :

		c.c.	mls.	yds.
1. G. E. Stanley (1 Singer) ...	85×88	... 499	... 60	1,552
2. S. L. Bailey (2 Douglas) ...	61×60	... 350	... 56	755
3. A. Woodman (2 Humber) ...	61×60	... 350	... 53	1,250
G. E. Hunter (2 Zenith sc.)...	90×77.5	... 988	... 16	laps.
W. L. S. Aitkin (1 Rudge) ...	85×88	... 499	... 12	laps.
P. J. Wallace (1 Rudge) ...	85×88	... 499	... 5	laps.
T. A. Carter (1 Rudge) ...	85×88	... 499	... 3	laps.



The Rudge team lost two of their best men, Stanhope Spencer having not yet wholly recovered from a bad fall on the track which happened a fortnight or so ago, while Elce was suffering from a chill. The meeting was fairly well attended, but the events were none too well supported. The car v. cycle races would have been interesting had the competing vehicles been more evenly matched, but the only one of these races to afford any real excitement was Event No. 3.

The next B.M.C.R.C. meeting is on Saturday, July 20th.

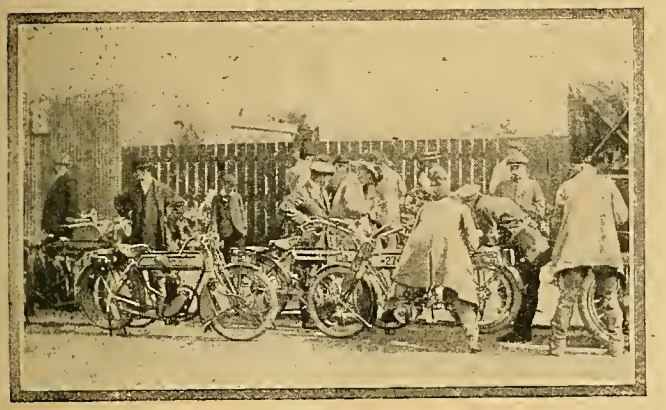


Enquiries are reaching us for pneumatic helmets for racing motor cyclists. Will the maker kindly communicate with the editor?

A New Counter-shaft Two-speed Gear.

WE are able to describe a new two-speed gear to be known as the G.H., and manufactured by Jardine's at Deering Street, Nottingham. The gear is of the counter-shaft type with gear wheels constantly in mesh, the change being effected by means of dog clutches. A special shock absorbing clutch of the multi-plate type with alternate plates of bronze and steel is fitted to the engine-shaft; from this the drive is taken by chain to a friction clutch of the three-plate type fitted with cork inserts on the gearshaft. This clutch is operated by a pedal on the right hand side, the dogs being engaged by a lever mounted on a quadrant on the top tube. All running parts are made of the finest nickel steel mounted on Hoffmann ball bearings, and the boxes of a special aluminium alloy. The fixing of the gear box is so designed as to be easily lined up in almost any modern motor cycle frame. Our illustrations show the gear attached to a 3½ h.p. Wulfruna. This particular gear has, we are told, run 1,400 miles, and there are as yet no signs of wear. Every part is carefully made to jigs, and consequently perfect interchangeability is ensured, and at the present time a special new plant is being laid down for the purpose of turning out the gear in large quantities. A few of the gears are already on the road and giving great satisfaction, and deliveries are being made steadily. On the road the gear has proved itself sturdy and sweet in action, while the two combined clutches enable a standing start to be made with ease and comfort even on a sharp upward incline.

Chain side of the Wulfruna motor cycle to which the G. H. gear is fitted.



G. H. countershaft two-speed gear showing operating pedal.

DUBLIN v. BELFAST.

M.C.U.I. Dublin Centre secures a Narrow Win.

AFTER being allowed to drop for a couple of years, the inter-city reliability trial between the Belfast and Dublin centres of the Motor Cycle Union was held on Saturday last, under the auspices of the Motor Cycle Union of Ireland. The Dubliners started sixteen riders, of whom three had sidecars, to Belfast's seven. The conditions were of the customary kind, a scheduled pace of twenty miles being fixed, with penalties for variations of more than a minute either way at the open and secret controls. There were four of the latter, mostly in the southern portion of the journey, and the open controls were at Dundalk and the finish. As in former trials between the two centres, non-stop runs were aimed at. The roads were wet for the greater part of the journey to Dundalk, but thereafter the conditions were very agreeable. All of the twenty-three starters duly arrived at the finish at Drumcondra Bridge, but as two of the Dubliners and one Belfast man omitted to return their checking cards the result we give below is provisional on their returns not affecting it.

Start of the Motor Cycle Union of Ireland Inter Centre Run held last Saturday.

The Dublin team won by three points, thanks to the energy of the Dublin and District Motor Cycle Club in whipping up a strong team to represent the capital. The best six riders on each side counted, and the scores were as follow :

DUBLIN TEAM.

	Marks.
J. Browne (3½ New Hudson)	*100
G. Roche (3½ Rover)	99
T. D. Rollins (3½ Rover)	98
P. J. Brady (3½ Rudge)	98
C. P. Kirk (3½ Triumph)	97
M. J. Doyle (3½ Humber)	97
	589

BELFAST TEAM.

W. Burney (2¾ Enfield)	99
J. "Newell" (3½ Ariel)	99
W. J. Chambers (3½ B.S.A.)	98
H. Boyle (3½ Triumph)	97
J. S. Garrett (3½ Ariel)	97
J. Stewart (3½ Triumph)	96
	586

*Maximum.

The other marks were : J. L. Walshe (6 Enfield sc.), 95; J. D. Weir (7 Indian), 94; E. W. Armstrong (3½ Rudge sc.), 92; W. J. Towell (3½ Rudge), 92; P. Hurst (3½ Rudge), 90; F. A. Cowan (3½ Triumph), 89; W. Beattie (3½ Rudge), 76; and T. E. Green, 65. Wallin, Cooms, and Kettle made no return

CLUB NEWS.

Western District M.C. (London).

The reliability trial to Daventry on the 2nd inst. was won by R. F. Addey (Triumph), the only rider to make a non-stop run.

Sarum and District M.C.C.

The first hill-climb was held at Bishopstone on the 29th ult. Francis (2¾ Humber) made fastest time in the lightweight class and N. Edwards (3½ Premier) in the heavyweight.

Carlyle (Chelsea) C. and M.C.C.

The first club reliability trial will take place on June 16th. The course will be a circular one, starting from East Horsley, and will have to be covered four times. No speedometers or watches will be allowed, and marks will be lost for being faster or slower than the schedule time. Entries must be sent to hon. sec. not later than June 10th.

Derby and District M.C.C.

The club intend making every effort to keep possession of *The Motor Cycle* Cup, and is sending a strong team to Daventry. The team will be as follows: E. V. Clarke (3½ Bradbury), A. B. Bennett (6 Brough), H. E. Sewell (8 J.A.P. sc.), H. Baker (3½ Triumph), E. Russell (3½ Russell), and A. Ainsworth (3½ Rudge), captain.

Reserves: E. Lee (3½ Rudge), W. H. Orme (3½ Rudge), and W. E. Murden (3½ Singer).

Cumberland County M.C.C.

The annual reliability trial was held at Whitsuntide. The start was from Carlisle at 1.30 p.m., and the route *via* Crawford, Stirling, Perth, Brecon, Stonehaven, Aberdeen, Arbroath, Dundee, Perth, Edinburgh, Hawick, to Carlisle. The nights were both spent at Perth, and lunch was taken at Aberdeen. There was little mechanical trouble, but some of the competitors suffered from punctures. The distance covered was 487 miles. Non-stop runs were made by Hilton Robinson (B.S.A.) and W. J. Moffat (Singer).

Chesterfield and District M.C.C.

A successful knock-out hill-climb was held at Amber on the 29th ult. H. C. Newman (3½ h.p. Ivy-Precision) won two very close races by inches. J. King (2½ h.p. Premier), a one-armed rider, rode with great skill. H. Eardley (3½ h.p. Premier) was second to Newman in the T.T. class.

Cork and District M.C.C.

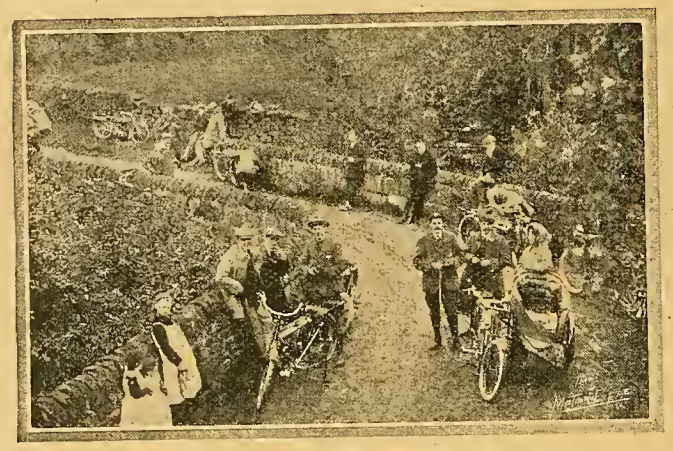
The two hundred mile reliability trial for the Gibson Cup, Cork to Abbeyleix and back, was held on Whit-Monday. Result : 1, M. J. Fitzgerald (3½ Bradbury); 2, W. J. O'Callaghan (3½ Zenith); 3, H. P. Dobbin (3½ Triumph).

Purley and District M.C.C.

The 240 miles trial on Whit-Monday resulted in a win for H. B. Willoughby (Rudge) with a total error of 21¼ minutes, E. V. Walters (P. and M.) being second with an error of 26¾ minutes, and V. Tomkins (Rover) third, 28¾ minutes. The winner holds a silver challenge cup (the President's gift) for one year, and receives a silver medal, a second silver medal (presented by Mr. H. S. Brett) being taken by the second man.

Edinburgh and District M.C.

The club held their sixth annual reliability trial on Victoria Day, when the good entry of twenty-nine was received. The entry included motor cycles, sidecars, and cars.



The route was a severe one, going from Edinburgh to Peebles, Innerleithen, Moffat, Dumfries, Wanlockhead, Biggar, and back to Edinburgh.

The official results are as follows: Full marks—A. H. Alexander (2¾ Douglas), R. H. Mouat (3½ Rudge), A. B. Lindsay (3½ Triumph), J. Forrest (6 Matchless), G. Morgan (3½ Bradbury), W. M. Fraser (3½ Triumph), A. U. R. Downie (3½ Ariel), Miss Downie (Forward), A. Kerr (3½ Triumph), T. L. Aitken (Clyno and sc.), J. M. Boyack (Clyno and sc.), J. R. Alexander, jun. (Indian and sc.), E. G. Thomson (16 Standard), and J. Steel (20 Ford).

Club News.—

Harrogate and District M.C.C.

Although the weather was very threatening, the rain held off until the annual members' hill-climb last Saturday for the Pilcher Trophy had been finished. Results:

Scene at the start of the Harrogate and District M.C.C. Annual Members' Hill-climb.

Class I.—Lightweights.

	Time. m. s.	Fig. of merit.
F. Mackay (2¼ Singer)	0 42	... 212

Class II.—Standard single-cylinders.

C. A. Nettleton (3½ New Hudson) ...	0 47⅕	... 258

Fastest time, H. W. Fortune (3½ Brown), 41⅗s.

Class IV.—Sidecars, etc.

C. A. Nettleton (3½ New Hudson) ...	1 10⅘	... 237

Fastest time, H. W. Fortune (3½ Brown), 56⅖s.

Class V.—T.T. singles, on time.

T. C. Atkinson (3½ T.T. Triumph) ... ... 36⅖s.

The class winners having to re-run for the trophy and make an improvement on their previous times, resulted in C. A. Nettleton becoming the holder for the second year in succession. W. B. Atkinson eventually made the fastest time of the day.

Mersey M.C.

A paperchase will be held on the 8th inst., meeting at 3 p.m. at the Shrewsbury Arms. A tortoise race was held on Saturday, June 1st. The machines were divided into two classes, two wheels and three wheels. Lowest gear allowed 5 to 1. Clutches not allowed to be used, and all with speed gears to use top gear. The course was about a quarter of a mile, and quite a good entry was received. First in two-wheeled class, F. C. Jones on 3½ h.p. T.T. Ariel. First in three-wheeled class, A. A. Jaffa on 7 h.p. Indian and sidecar.

Cardiff M.C.

The annual twelve hours' reliability trial was successfully held on Whit-Monday, when sixteen entrants started on the trial over the following route: Cardiff to Newport, Abergavenny, Crickhowell (check), Bwlch Hill (check), Llangorse, Talgarth, Builth, Rhayader (check), Llangurig to Aberystwyth (check), and return by Devil's Bridge (check), Llyffryn Castell to Rhayader, Builth, Erwood, Llyswen Hill (check), and home to Cardiff, a distance of, as near as possible, 230 miles, which had to be completed in twelve hours. The following successfully covered the route in the twelve hours and kept to schedule time at the controls: G. H. Smith (8 J.A.P. sc.), E. Chapman (6 Zenith sc.), J. C. Moore (3½ Rudge), C. R. Pratt (3½ B.S.A.), C. E. M. Peaty (3½ Matchless), W. H. Bowen (3½ Triumph), and H. Wessendorf (3½ Premier). The following completed the course in schedule time, but failed on one of the two test hills: A. H. Morgan (3½ Triumph) and D. Robertson (3½ Triumph). The following completed the course, but were late or early at one or more of the controls: E. Courtney (twin Kerry sc.), J. Wallace (8 Zenith sc.), and G. Sanday (3½ Ivy-Precision), who also failed on one of the test hills.

Torbay and District M.C.C.

Halsanger Hill, on the edge of Dartmoor, and about two-thirds of a mile long, formed an almost ideal hill for last Saturday's climb. It is nearly straight for the whole distance, with only one cross-road. Three classes were run and good times were made, fastest for day being A. C. Arden's 3½ h.p. Premier. Results:

500 c.c. Class.

	M. s.
1. A. C. Arden (3½ Premier)	1 6⅕
2. E. J. Hancock (3½ Premier)	1 8⅖

Lightweights to 345 c.c.

1. A. Powell (2¾ Enfield)	1 18⅕
2. W. Harding (2¾ Douglas)	1 18⅗

Passenger, Unlimited.

1. Birdsall (3¾ twin Premier and sc.) ...	2 31⅖

Scarborough and District M.C.C.

The following are the results of the flying kilometre speed trials, held on the 27th ult.:

Class 1.—Lightweights.

	Time.	m.p.h
H. Moon (2¾ New Hudson)	54s.	... 41.4

Class 6.—Singles and sidecars.

C. Swinney (3½ Triumph)	64⅕s.	... 35.

Class 7.—Twins and sidecars or cyclecars.

G. Armstrong (8 Gordon)	76⅖s.	... 29.3

Class 2.—Standard touring singles.

D. Bradbury (3½ Norton)	38⅘s.	... 57.5

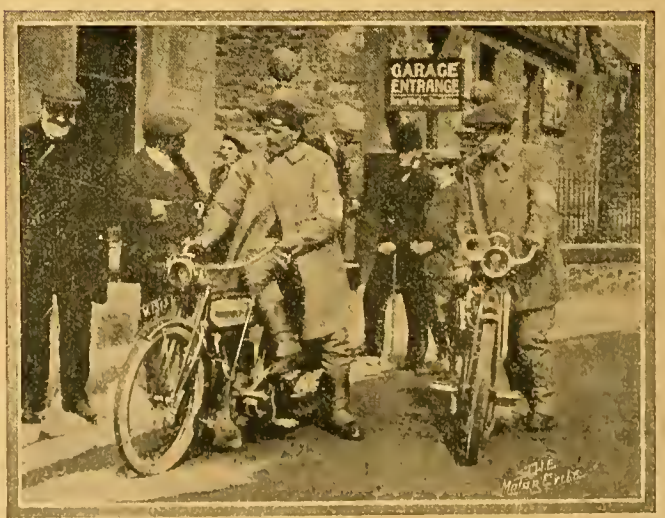
Class 3.—T.T. singles, etc.

R. Flint (3½ Norton)	38s.	... 58.8

All-comers' Class.

H. D. Shaw (8 Zenith)	52⅕s.	... 69.75

A flexibility hill-climb was held on Wednesday, the 29th ult., on Foxholes Hill, on a straight hill about threequarters of a mile. Result:



1. G. Armstrong (Gordon cyclecar), fast time 2m., slow 7m. 49⅗s., difference 5m. 49⅗s.

2. D. Bradbury (3½ Norton), fast time 46⅖s., slow time 4m. 3⅗s., difference 3m. 17⅕s.

Afterwards a knock-out handicap was run between H. Lofthouse (2 Humber) and J. W. F. Tranmer (2¾ Humber). The latter won the monthly medal by two yards.

Wishaw and District M. and M.C.C.

A reliability trial of 120 miles was held on Saturday last. Wm. Morton (2¾ twin Humber), George Brown (3½ Triumph), John Adams (3½ Zenith), W. Marshall (3 Clarendon), L. MacLean (3½ Triumph), and D. McCartney (2¾ Royal Enfield), all arrived at controls near schedule time, and it has been left to Mr. W. H. Cox, of the A.A., to make the awards.

Wishaw and District M.C.C. 120 Miles Reliability Trial. G. Brown (Triumph) and W. Marshall (3 h.p. Arne) about to leave the Peebles control for the last stretch of forty miles to Carlew, the finish.

Club News.—

E. Goult, hon. sec., starting on his 3½ h.p. Rudge in the Doncaster and District M.C.C. reliability trial.

Derby and District M.C.C.

The hundred miles reliability trial, which is a fixture with the club for the Whitsuntide holiday, drew a good entry, and was run off in fine weather. The course was one of three circuits, the route being laid over some difficult country in the Ashbourne district. Punctures accounted for most stops; a stop of any description, beyond a breather after each circuit, disqualifying. Results:

1. E. Russell (3½ h.p. Russell). Haskard-Mitcham Challenge Cup.
2. W. H. Orme (Rudge).
3. G. Hardy (3½ h.p. Humber).

Dublin and District M.C.C.

The following are the placings and awards in the Dublin to Lisburn and back reliability trial of the Dublin and District Motor Cycle Club which was held on Whit-Monday:

GOLD MEDALS.

	Marks.
J. Browne (3½ New Hudson)	100
J. P. Quill (2¾ Douglas)	100
G. Roche (3½ Rover)	100

SILVER MEDALS.

E. W. Armstrong (3½ Rudge sc.), T. E. Greene (3½ Rudge), T. D. Rollins (3½ Rover sc.), C. Magennis (3½ Rudge), P. J. Brady (3½ Rudge), H. T. Carroll (3½ Rex), T. Woods (3½ Premier), F. J. Walker (3½ Rudge), J. D. Weir (7 Indian sc.), C. E. Murphy (3½ Triumph), P. Beattie (3½ Rudge), T. A. Ireland (7 Indian sc.), R. Walsh (4 Calthorpe), J. Healy (3½ Rudge sc.), F. Keogh (3½ Triumph), J. H. Taylor (3½ Rudge), T. J. Dunphy (7 Indian), V. Barton (3½ Triumph sc.), O. G. Price (3½ Rudge sc.), W. G. Greene (2½ A.J.S.), and R. Lowry (3½ Rover).

The first three riders were declared joint holders of the cup. Last year the cup was won by T. Woods, of Newbridge, and C. E. Murphy, of Cootehill, but neither of these riders figured so prominently this year.

Motor Cycle Competitions in New Zealand.

THE Otago Motor Cycle Club held a series of competitions at Easter, which included a club run to Naseby (ninety-five miles), a reliability trial for sidecars to Naseby, and hill-climbs and speed tests *en route*.

A start was made from the railway station in Dunedin at 7.30 a.m. The weather was not as good as could be desired for holiday touring, but as the day grew it improved. The roads were in beautiful condition, but some riders experienced difficulties in getting up the steep grades after riding through the various watercourses. The course was an ideal one for a test, being almost one continual series of hills. Only five competitors started in the sidecar trial, as follows: G. Thorn (3½ h.p. New Hudson), E. Howlison (4½ h.p. Norton), W. Gibb (7 h.p. Indian), W. Cameron (Bradbury), and D. Brown (Bradbury).

When twenty miles out, the sidecar became detached from the New Hudson, so Thorn discarded it and rode solo. Cameron and Gibb both had the unique experience of capsizing over a bank in their efforts to climb one of the numerous long winding hills, but Howlison and Brown reported a good run and came through without loss of marks. These two riders took part in a further test, and Howlison won.

On arrival at the Brother's Hill (sixty miles), a fast hill-climb and a slow hill-climb were held.

FAST HILL-CLIMB.—Meek (Triumph), 25s., beat McDougall (Triumph), 3s., by about 4s.

SLOW HILL-CLIMB.—McDougall (Triumph) beat Crolly (Bradbury).

Next morning the speed events were held on a straight piece of road near Naseby, and some excellent performances were made. Results:

TWO MILE HANDICAP. Run singly against time.

	Time. m. s.	Result. m. s.
1. Meek (3½ Triumph), handicap 40s. ...	3 8 ...	2 28
2. Ansell (3½ Triumph), 15s.	2 52 ...	2 37
3. Lawrie (3½ T.T. Rudge), 10s.	2 48 ...	2 38

FOUR MILE HANDICAP.

	m. s.	m. s.
1. Pridham (3½ Humber), handicap 90s. ...	6 48 ...	5 18
2. Fancourt (3½ T.T. Triumph), 30s. ...	6 13 ...	5 43
3. McDougall (3½ Triumph), minus 5s. ...	5 42 ...	5 47
3. Lawrie (3½ T.T. Rudge), 5s. ...	5 52 ...	5 47

FLYING MILE RECORD (for Silver Cup presented by Mr. J. McKenzie).—1, McDougall (3½ Triumph), 56⅖s.; 2, Maddox (3½ T.T. Triumph), 1m. 1⅗s.; 3, Fancourt (3½ T.T. Triumph), 1m. 2⅞s.; 4, Lawrie (3½ T.T. Rudge), 1m. 3⅖s.

Chesterfield and District M.C.C. hill-climb at Amber Hill, Kelstedge. J. D. Mitchell (T.T. Rover) left, and J. J. Kelly (T.T. Bradbury) on right starting in their heat, which was won by Mitchell.

Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

London to Newquay, Cornwall.

Will you please tell me which is the best route from Westminster to Newquay in Cornwall, with distance?—A.F.

Your best plan would be to go straight through London, down Kensington High Road, and through Hammersmith Broadway, Chiswick, Brentford, Hounslow, Staines, Bagshot, Blackwater, Hook, Basingstoke, Whitchurch, Andover, Salisbury, Wilton, Shaftesbury, Sherborne, Yeovil, Crewkerne, Chard, Honiton, Exeter, Okehampton, Launceston, Camelford, Wadebridge, St. Columb, to Newquay. The distance is approximately 260 miles.

Transmission and Power for Sidecar.

(1.) Do you consider a chain-driven motor cycle less expensive than a belt-driven one? (2.) Is it a disadvantage to have the crank case a fixture to the frame? (3.) Would a 3½ h.p. chain-driven two-speed take sidecar or would you recommend a 5 h.p. A.J.S.? (4.) Is the 5 h.p. much more costly to run—about how much per mile approximately?—G.E.S.A.

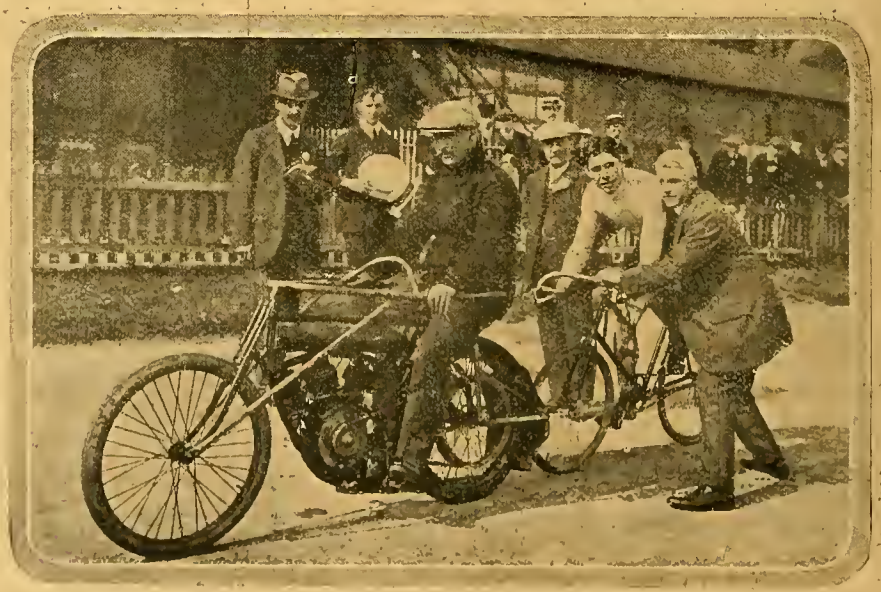
(1.) There is little to choose, but probably chain drive is the more economical. (2.) No, we do not think so. (3.) For sidecar work the 5 h.p. would be better. (4.) A 5 h.p. would cost about 1¾d. per mile to run against 1¼d. for a 3½ h.p. with sidecar.

Loss of Pace but not of Power.

My 1912 two-speed machine has now run 2,300 miles. Machine has run 500 miles since last overhaul. It has now become unaccountably slow, and to run at 20-25 m.p.h. requires half throttle or more. Half a spring added to a.o.i.v. has improved it a very little. Compression in both cylinders is good. Jet and petrol pipe clear. Power is as good as ever on hills. (1.) Is it possible for the magneto to have retarded itself, and if so, would that cause slow running without much loss of power? (2.) What throttle would be used when travelling 25 m.p.h.?—G.B.S.

(1.) The magneto timing may be too late as you suggest, and we should advise you to check this. It would account for the trouble and be likely to cause overheating. A weak exhaust valve spring also may cause falling off in power. (2.) The position of the throttle entirely depends upon the condition of the roads. A heavy road requires more opening.

Care of Magneto.



I have just purchased a 4 h.p. single-cylinder machine with Bosch magneto. The machine runs and climbs well for about sixteen miles, sometimes less, when it starts missing until finally it stops, and, on inspection, I find magneto is giving no spark at plug. I then take out the terminal with high tension wire attached, and find a little piece of carbon with spring attached. I pull this out longer and clean carbon pencil, and off it goes again, and I cannot tell why this makes it go. If I could I should like to know what to do another time.—H.S.

Evidently the collector ring is dirty. This should be cleaned by wrapping a piece of clean rag round the end of a penholder, soaking it in petrol, and applying it to the collector ring, turning the magneto round meanwhile. What you did was to increase the tension of the spring and keep the carbon brush more firmly pressed against the brass of the collector ring. What you ought to do is to buy a copy of "Motor Cycles and How to Manage Them" (obtainable from these offices, price 1s. 2d., post free), where you will see the working of a magneto carefully explained. Probably the trouble is that the magneto wants cleaning, and occasionally oil gets on the collector ring and prevents it sparking.

An Auxiliary Air Inlet.

I have a 1911 2¼ h.p. single with automatic carburetter. The machine runs perfectly in every way, but it seems to me that an extra air inlet would economise and be an advantage. (1.) Would an extra air inlet in the inlet pipe interfere with the working of the carburetter? Of course I should only use it on a long run when going fast. (2.) The magneto is fixed. Does this give the spark at the right moment for all speeds? The makers claim that it gives the necessary advance by a hotter spark at speed, which is not quite clear to me.—E.A.C.

(1.) An extra air inlet might make a difference. It would not interfere with the working of the carburetter, because if closed the machine would work exactly as if it were not there, provided, of course, there was no leakage of air. (2.) There is a good deal in what the makers say, but, personally, we think you would do better with a handle-bar controlled magneto. Both these can be controlled by Bowden wires.

Leon Meredith, motor-paced by Cordingley, who broke the five miles record for the New Brighton track on Whit-Monday.

LONDON-EDINBURGH RUN.

H. C. Mills (3½ h.p. Premier) rode into the Doncaster control with a punctured back tyre. Above he is seen repairing it.

Cleaning Magnets.

I shall be very much obliged if you will inform me as to the following: The magnets of the magneto on my 3½ h.p. machine have become rusty. Will this in time affect the working of the magneto? How should I treat the magnets to clean off the rust and prevent it recurring? Would emery paper do and then follow with a coat of Velure?—D. H. Lowes.

The fact that the magnets have become rusty will not affect the machine, but we should advise you to clean off the rust with emery paper, without taking the magneto down if possible, and then black over the magnets with some preparation. Velure would do, but perhaps a dull black would do better.

London to Clacton-on-Sea.

Will you kindly inform me the best route from Cricklewood to Clacton-on-Sea, avoiding as much of London as possible?—J.G.L.

Your best route would be as follows: Cricklewood, *via* Childs Hill Lane on to Hampstead Heath, from there straight on to the Great North Road at East Finchley. As soon as you strike the Great North Road turn left, take the first turning on the right, and go straight on down Muswell Hill, follow the tram-lines with overhead wires till you reach those with central standards; here turn right for about 100 yards and then turn left, where there is a little green on the right, keep straight on till you meet the main road to Ware. Follow this road for about 100 yards to the left, turn right past Tottenham Station by the East London waterworks, keeping straight on till you reach Woodford. Go through Woodford and Epping. At Epping turn to the right and you will find yourself on the Chelmsford Road. Follow this through to Colchester, and you reach Clacton by the way of St. Osyth.

Deposit Paid on Sale of Machine.

I have a machine which I offered for sale, and a friend informed me verbally he would buy it. A few days after this, I asked him when he would take delivery, and he replied immediately after Easter, so as to give him an opportunity to sell his old machine. I was not satisfied with this, and requested a small sum on account so as to make sale a certainty, and he promptly paid me £5 on account, for which I gave him a receipt. Of course, beforehand, he had satisfied himself that the machine was a bargain and suited his purpose. I have now approached him for balance of payment so that I can hand over machine, but he desires to cancel the arrangement and demands return of £5 paid to me, only on the grounds that he cannot sell his old machine. I refuse to do this, as I have naturally lost other opportunities of disposing of machine elsewhere. (1.) Can I legally force him to pay balance and take delivery of machine? (2.) Is he obliged to forfeit the £5 so that I can sell machine at reduced price?—J.S.

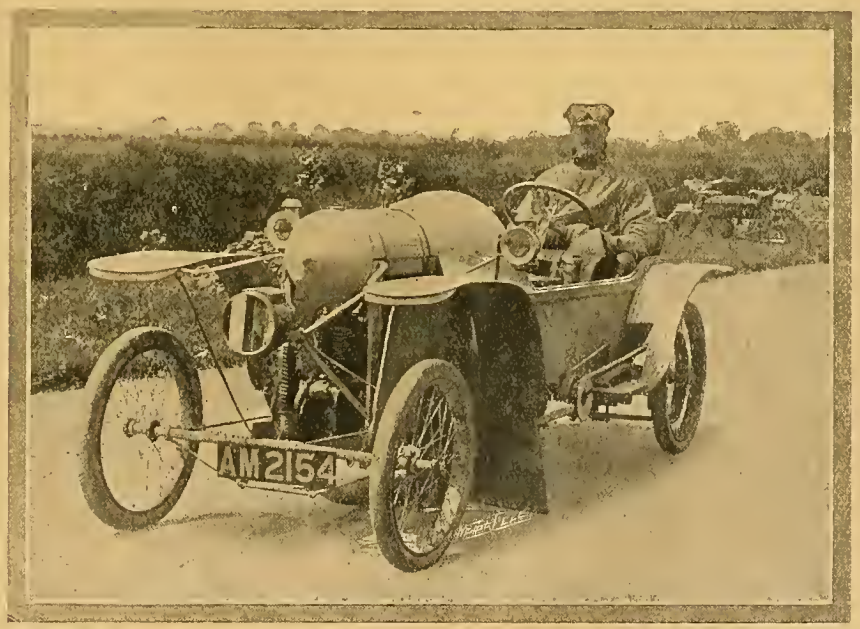
Our legal adviser writes as follows: "'J.S.' can proceed against the purchaser for payment of the balance, and he need not deliver up the machine till payment is made. With regard to forfeiting the £5 paid as deposit, the purchaser would certainly lose this if the correspondent has to resell, and if the £5 deposit is not sufficient to cover the difference between the price he ultimately gets and the price he sold the machine for originally, he can recover the difference, provided, of course, that in the resale he gets the market value of the machine. I am, of course, assuming that the purchaser would not be able to prove that the sale was subject to the disposal of the old machine. Apparently there is nothing in writing, and if any such arrangements were made, the purchaser should have seen that it was incorporated in the receipt he obtained for the £5 on account."

Redditch to Uxbridge.

Would you kindly send me the route from Redditch to Uxbridge, near London, with distances between towns, also an alternative way back again?—F.P.

We should advise you to go from Redditch to Uxbridge *via* Alcester, Stratford-on-Avon, Shipston-on-Stour, Chipping Norton, Woodstock, Islip Wheatley, then join the London-Oxford Road at Wheatley and go through Aston Rowant, Stokenchurch, High Wycombe, Beaconsfield and Gerrard's Cross, to Uxbridge. The distance would be approximately ninety-six miles. An alternative way back would be *via* Amesbury, Aylesbury, Bicester, Banbury, Stratford-on-Avon, Alcester, to Redditch. The distance would be approximately eighty-six miles.

EXPERIENCES WANTED.

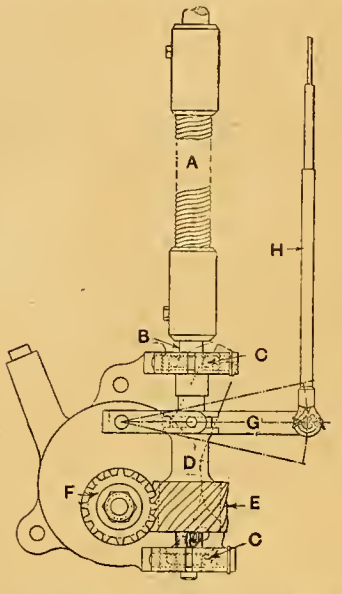


Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

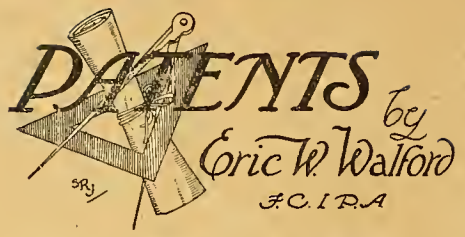
"A.O.H." (Brixton). 1912 5-6 h.p. Clyno.

"H.G.G." (Portsmouth). 5-6 h.p. two-speed F.N. and sidecar.

"A.P." (Romford). 3½ h.p. chain-driven 1912 Bradbury, also 5 h.p. chain-driven A.J.S., both with sidecar.



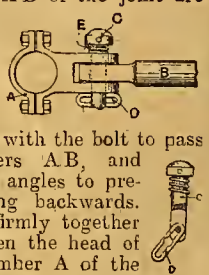
"J.G.S." (Manchester). 2½ h.p. Levis, particularly as regards wearing qualities, hill-climbing, and consumption.



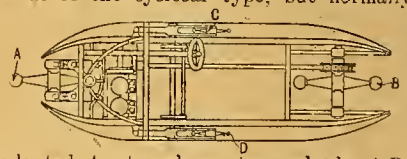
A racy-looking Sabella cyclecar, owned by K. F. Dunsterville, of Tynemouth Castle. This is one of the first of this type of car to be seen in the North of England.

Magneto Driving Mechanism.

This construction is so designed that the spark always takes place at the instant of maximum flow of current, the timing of the spark in the cylinder being variable by moving the transmission-shaft

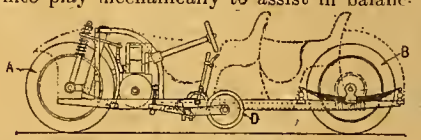


of the magneto in relation to the engine-shaft from which it is driven. In the construction illustrated, a flexible shaft A is employed, which is secured to a spindle B running in ball bearings C. On a squared part of the spindle B is a sliding sleeve D, carrying a worm wheel E driven by the wheel F on the engine half-time shaft. Engaging a groove on the sleeve D is a pivoted lever G provided with an operating rod H. It will be seen that by operation of this rod the sleeve D will be caused to slide on the squared part of the spindle B. At the same time the engagement of the wheels F and E will cause the latter to rotate the spindle D and shaft A, thus advancing or retarding the magneto drive in relation to the engine. —Société Rêne Gillet et Cie., No. 9,948. 1911.



A Sidecar Joint.

The two members A B of the joint are secured together by a bolt C, which passes through them and is provided with a link-shaped member D, which can be turned longitudinally with the bolt to pass through the members A B, and then turned on right angles to prevent the bolt moving backwards. The parts are held firmly together by a spring E between the head of the bolt and the member A of the joint.—A. Pilkington. No. 9,442, 1911.



A Two-wheeled Cyclecar.

The accompanying elevation and plan illustrate a construction of vehicle somewhat of the cyclecar type, but normally

adapted to travel on two wheels A B, supplementary wheels C D being brought into play mechanically to assist in balancing the vehicle at low speeds.—E. C. F. Otto and W. K. L. Dickson, No. 6,705. 1911.

THE MOTOR CYCLE
T.T. and Summer Number
THURSDAY,
June 27th, 1912.

Garages.

The Colonnade Motor Cycle Exchange inform us that they have moved into larger and better premises at 56a, Seaside Road, Eastbourne, behind the Riviera Restaurant.

An Australian Record.

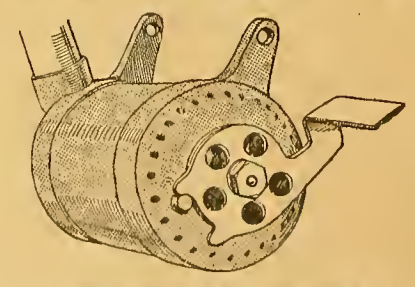
We are informed that W. E. Peverill, riding a machine fitted with a 3½-4 h.p. Fafnir engine, has just succeeded in establishing a Melbourne to Brisbane record. He experienced no trouble of any kind.

Our Bookshelf.

"Manxland: What to See and Where to Stay," by W. Keig, proprietor of the Sefton Hotel, Douglas. This little booklet describes many interesting excursions which can be made in the charming Isle of Man, so favourably disposed towards the sporting side of the motor cycle pastime.

Lightweights in Western Canada.

Henry S. Rungay, an Englishman residing in Newdale, Manitoba, says he is more than pleased with his Motosacoche, which will climb any hill. The trail or path in some of the ravines is less than a foot wide in many places, but his lightweight Motosacoche always gets there.



Sealed Oil Tins.

Messrs. the Stern Sonneborn Oil Co., Ltd., Royal London House, Finsbury Square, E.C., have now put on the market a new patent sealed tin containing one pint of Sternol motor oil A for air-cooled engines. The tin is fitted with two loops, so that it can be conveniently strapped on to the machine.

Handle-bar Control of Low Gear.

Mr. S. W. Philpott, manager for Messrs. Henry Whitlock and Co., 40, Hope Street, Liverpool, informs us that he has designed and fitted a handle-bar ratchet attachment for 1912 Humber two-speed geared machines by which the low gear lever can be held permanently in the "on" position. This enables the low gear to be used for a walking mount, if desired, instead of starting the engine by the handle. The fitment is supplied ready for fitting to Humber machines with all instructions.

A silencer cut-out is now being fitted to the 2¾ h.p. twin Humber. Above we illustrate the design adopted.

A New Appointment.

We learn that Mr. A. P. Moeller, late secretary of the Amateur Camping Club, has joined the staff of Messrs. Robertson's Motor Agency, 157, Great Portland Street, W.

Successful Accessories.

The Lycett trophy winner, T. Pollock, who rode a 3½ h.p. single-geared James, used a new pattern Lyso belt and Dunlop tyres on his machine. A. D. Arter, who was second on his three-speed chain driven James sidecar, used Rom tyres.

Rex Reliability.

For the seventh time in London-Edinburgh Runs, W. A. Jacobs won a gold medal, while both Le Grand and White have never failed to qualify for awards—always on Rex machines. The three above named rode 6 h.p. Rex sidettes this year, "covering in all about 900 miles without the slightest trouble," to quote Mr. Jacobs's own words.

Another Metropolitan District Map.

Another map of routes round London has just been published by Messrs. G. W. Bacon and Co., 127, Strand, W.C. This map covers a far larger area than the R.A.C. map which was published about a fortnight ago, and is especially suitable for showing routes in the districts round the Metropolis, but is not so rich in detail, nor does it exist for quite the same object as the former. Ordinary macadam country roads are shown green: 'bus routes, 'tram routes, and roads in which there are both 'buses and trams are shown by distinctive marks. Distances from place to place are also clearly indicated.

Lycett's 'LYSO' -the leading Rubber Belt.

Reliability and Comfort

are the paramount features of the "LYSO" Belt and "LYCO" Seat—features exclusively their own—and users everywhere are endorsing the marked excellence of these two products of the "Good LYCETT Lines."

—Of the "LYSO" Belt, we here have some remarkable records recently achieved at Home and Abroad—note them. On May 11th, 1912, at

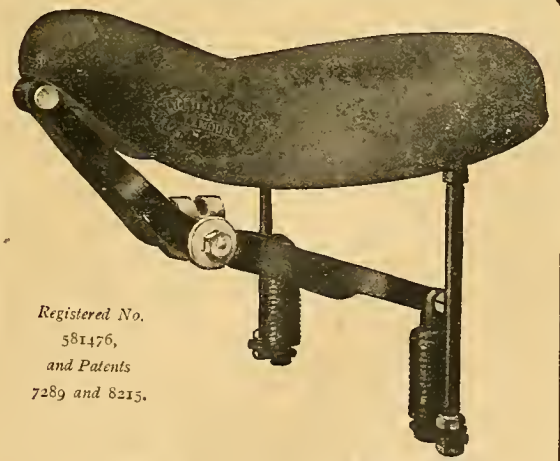
BROOKLANDS, 50 Miles (500 cc.) Senior T.T. Race; W. H. Elce 1st and won the "Ross" Cup on a Rudge.

PORTMARNOCK SPEED TRIALS, 4 Miles Scratch Race; T. Green 1st, F. J. Walker 2nd, J. Healy 3rd. 20 Miles Handicap—Price 1st, T. Green 2nd, F. J. Walker 3rd, J. Healy 4th, all on Rudge's.

JOHANNESBURG-PRETORIA-JOHANNESBURG—The Derby of South Africa. Rudge 1st and fastest Time, Record for course, on a Rudge.

CUMBERLAND M.C.C. KNOCK-OUT HILL CLIMB, WARMEL FELL. Vernon Taylor 1st, on a Rudge.

BRADFORD M.C.C. OPEN HILL CLIMB, LEATHLEY BANK, May 18th, 1912, Zenith machines here won 6 firsts, 1 second and won the "Eric Myers" Trophy. They made 1st, 2nd, 3rd, 4th fastest time of the day and also the record time for the hill climb. Also Rudge machines obtained 3 firsts, 1 second, and 1 third. All above were fitted with "Lyso" Belts. How's that for Reliability?



—Of the Seat, Mr. Cyril M. Webster writes: "I have tried most of the best makes but consider yours ranks ahead of any other. The absence of vibration and road jar is really marvellous, one might be riding on air."

—See YOUR mount is fitted with this world-famous Belt and Seat and enjoy the advantages these perfect fitments ensure.

—Obtainable of all Agents or direct—Write for copy of "The Saddle Book."

LYCETT'S

"The Saddlery," Birmingham.

Registered No. 581476, and Patents 7289 and 8215.

LYCETT'S "LYCO" PAN SEAT.

Admittedly the World's really perfect Motor-cycle Seat.

ROBERT BEVAN, Castle Street, CARDIFF.

MUST BE SOLD.

We are still worrying you to send for that list, which has now been revised, and let us have your orders for anything that there is to suit you. We have told you for the last two months that the garage is too small for the enormous stocks that we bought at the Show. What with A.C.'s, Morgan Runabouts, and other three and four-wheelers, not to mention Clyno and sidecars, Matchless, Jap-Bat, P. & M., Scott, Rudge, Triumph, Zenith, Humber, Premier, and other things that we are Agents for, and are having in every week, therefore we are compelled to make a move on the Second-hand Motor Cycles. We are out to lose money to clear them out; but naturally as little as possible. What we want you to do is to get on the move and study the prices in latest list, when we are sure you will be a buyer. We are compelled to sell, as we cannot get a bigger garage in Morecambe or district. We have the stuff coming in, and must have somewhere to put it. All we can do is to ask you to buy it from us. If we cannot sell it at our price, we will try and do so at yours. In the last week or two we have sold some Magneto Machines at from £10 to £12, which should have really been £17 to £20; but what's the use of keeping them here, filling up the place, and hindering good new business. We have also sold some good lightweight machines for a few pounds that should have been at least a dozen. Many other machines we have sold at £5 or £6 a time.

With us, bhoys, you can buy on cash or deferred terms, and a deposit of from £3 to £13 will purchase a machine. The balance can be paid in weekly or monthly instalments. Terms may be arranged to suit all pockets.

The Sunny Jims, of course, have twigged it and we have been swarmed with the bhoys on Saturday afternoons and local half-holidays; but still there is plenty left for you. Of course, with the enormous stocks that we have, it takes a lot of shifting. If you intend having a motor cycle, don't waste any more time. Speculate in a postcard, and ask for our Special Sale List. If we send you a list, and it does not do you any good, it won't do you any harm. The sight of it will startle you, and you will be wondering why you did not get one before. If you have had an older list get the **latest** with last reduction.

There is a splendid mixed stock left, and you need not hesitate to buy now. Everything that we send out is sent on our usual terms: Cash with order. If the machine is not as per specification, you are at liberty to return **within three days** and have your money back **in full.** At all times we are pleased to entertain exchanging Motor Cycles for other second-hand machines. Whatever you do, you cannot get wrong with us. We are out to seek your trade and make room.

We have been advertising for a long time now, giving you advice, and the fact that we were last week enabled to tell you that our turnover for the last six months (winter months) had increased by £5,000 over the six months in the summer half-year preceding, shows that we treat our clients in a straightforward manner, otherwise they would not be interested in dealing with us. Remember that there are many firms in the trade, but only one that will **return you your money as above.**

If you want anything in the way of Accessories we are sure you might go further and fare worse than drop us a postcard for our Accessories List. The prices are low and the quality good, and as we are gradually declining this branch of the business, we are interested in disposing of the stuff. Some things are cleared out, but there still seems to be plenty left. If you want anything, write. Don't leave it until to-morrow. Get your postcard sent at once, only, when you send the postcard, don't forget your name and address, and ask for the lists you want.

There is little use in calling yourself, say, John Smith, and not put the name of the street on, as there are scores of John Smiths in every town in Great Britain. Give us your full address, and there will be no difficulty.

We might also mention that we are on the telephone, and there is nothing like being sharp about it. Get on the 'phone and ask us what we have to sell, and you will probably buy it straight away. If you happen to be in the trade, whether in a large or small way, it will do you good, as we have plenty to sell, and will give you a trade discount off everything that we have to move. We don't work for nothing, neither do we expect anyone else to do so therefore, please let us have your enquiries.

From **£10** down will purchase a new Motor Cycle. We are in a position to deliver any machine on the market on these terms. The balance of the money we are prepared to allow you to pay in instalments spread over twelve months, so that you do not feel the paying for the machine, whilst you are at liberty to ride it and have the full enjoyment from same. Our system is the fairest on the market, whilst our selection of high-class models excels all others. Our deliveries are the quickest, and there is no reason why you should be without a machine. Please get on the jump and let us hear from you. If you do not want a new machine, the same terms will apply to a Second-hand one. The deposit will vary according to the class of machine. Remember the address, and write for our lists at once.

Until next week, bhoys, good-bye. If you have not seen the Canaries, it is time you came down to the sea.

Hitchen's, Ltd., Morecambe.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts and Hants Channel Islands.

SECTION VIII.
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX
Somerset, Devon, Dorset, and Cornwall.

SECTION X.
Scotland.

SECTION XI.
Ireland and Isle of Man.

WAUCHOPE'S

9, SHOE LANE, FLEET STREET, LONDON, E.C.

'Phone: Holborn, 5777.
Wires: "Opilicer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

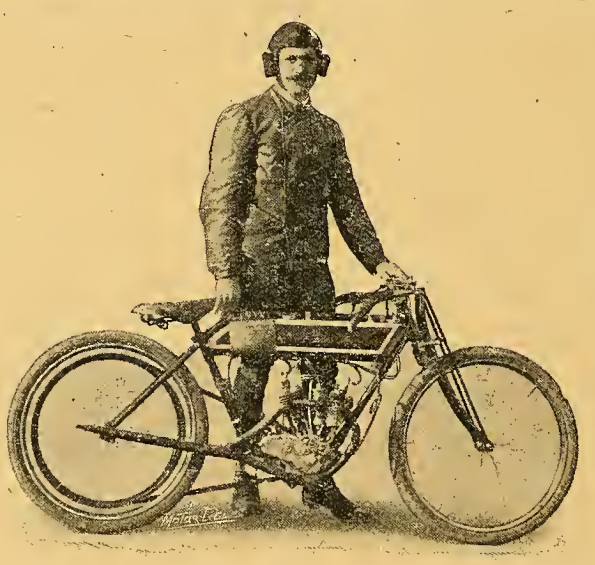
Manufacturers' Commendable Decision.

SOME weeks ago we announced that the Motor Cycle Manufacturers' Union was considering the question of restricting the number of open events by selecting a certain number of the most important, which it would agree collectively to support and to ignore the remainder. The selection of the representative events has now been made, and will be found in another part of this issue. This is undoubtedly a move in the right direction, as all will admit that the large number of open motor cycle competitions week by week in various parts of the country is really getting monotonous. There is hardly need for us further to dwell upon this question, as in our recent remarks under the heading of "A Glut of Open Hill-climbs," we stated clearly our views on the subject. We must congratulate the Manufacturers' Union upon coming to this decision, for it is only within the power of the A.C.U., the governing body of motor cycling, and the Motor Cycle Manufacturers' Union to reduce the number of contests, the former by cutting down permits and the latter by abstaining collectively from competing. The A.C.U. might easily have withheld permits from clubs, or restricted the number of open events arranged by any one club to, say, two per year. However, the A.C.U. has not seen its way to exercise its authority in this matter, so we welcome the manufacturers' announcement to the effect that they have selected from the fixture lists issued by the leading motor cycle clubs ten events which they have decided to support collectively, not only with entries from the firms connected with the Union, but also in the matter of prizes which will be given to the organising clubs out of the funds of the Union. This decision refers only to day trials, and the organising clubs selected may be altered another year.

Waning Interest in Hill-climbs.



NOTHING, we believe, has yet been definitely decided with regard to hill-climbing competitions, although it is plain to see that these forms of contest are fast losing the interest which was once attached to them on account of their frequency, and it is high time something was done to restrict their number. We suggest that the Auto Cycle Union would be wise to fall in line with the Manufacturers' Union, and now restrict the number of hill-climbing competitions instead of issuing permits to all and sundry whether the club be experienced in the organisation of open contests or not. The result would benefit all eventually, for instead of having a host of unimportant events with unrepresentative entries, we should have a certain number of really important national contests, and a first prize would be worth winning. At present the value to the maker of winning a hill-climb lasts but one week, for it has become the usual practice for a move to be made to the other end of England the following week-end, and the positions of the leading riders to be reversed. So long as this goes on interest will wane, and it has already had its effect by more than one leading manufacturer having decided to withdraw from hill-climbing contests. One open hill-climb per month is ample in our opinion. We exclude club members' hill-climbs, which may be as frequent as the organisers have time to arrange details; our remarks refer to open events which manufacturers feel bound to support.

My Most exciting Ride: No. 4. SAM WRIGHT.

Interrogated by L.C.

SAM WRIGHT has had a considerable amount of experience on the road, but on trying to hunt up an exciting incident in his career he could not think of anything beyond the many little incidents which every motor cyclist encounters.

"At Southport," said he, "in the speed trials of 1903, I had an exciting time at the end of the kilometre race. I was riding a 2¾ h.p. Excelsior, and had just completed the course at a speed of sixty-two miles an hour, when I found myself running into a gradually narrowing avenue between rows of cars. Then one row gave place to a wall, and as I sped through one hand grazed the wall while the other grazed the cars. I don't know how I kept the machine up, but I did.

"But for real excitement, I think my hour record ride in Class B at the Brooklands Track last November was the race. With my watch on my wrist I saw that I was lapping at about 2m. 45s., and I knew this was good enough for record. Gradually the hour began to close, leaving me in a state of great excitement. First I would look at the watch, then turn and see the lap scoring cards at the fork, denoting the distance I had done. All the time my ears were keenly waiting, almost expecting that some mechanical trouble would put an end to my aspirations. As the time drew shorter this terrible apprehension, which I could not get rid of, became more pronounced, but I kept on going, getting everything I could out of the engine, which, despite my morbid feelings, was doing its work well. On I went, the great white track flying beneath me as I covered lap after lap and saw the scoring board faithfully chronicling my distance. At last the end came, and with considerable relief I switched off with the satisfaction of knowing that the record—nearly fifty-nine miles in the hour—was mine." This record was made in Class B (under 350 c.c.) on a twin-cylinder 2¾ h.p. Humber lightweight.

Following in father's footsteps.

Riding Tips.

On interrogating Wright as to riding tips, he was most emphatic in declaring that every motor cyclist has to find his own tips, and that the experiences of one man are of no value to another.

"You must," said he, "adapt your brains to your own particular machine, and by your very knowledge of it, learn tips which nobody else could give you. If there is one thing which is general in its requiring attention, one thing which every motor cyclist must do to ensure good running, it is the care of the carburetter.

"Always look after your carburetter; it is the main thing. You can generally trust the engine if you look after the subsidiary contrivances. Half the trouble on the road is caused by faulty carburation, and still more can be traced back to it."

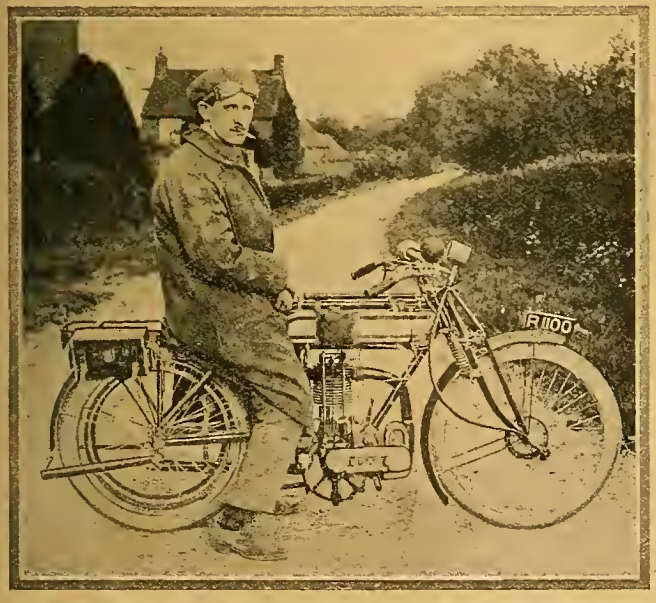
A Recent Achievement.

Sam Wright's most recent achievement is an ascent of Bwlch-y-Groes, more commonly called Dinas-Mawddwy. This mountain pass rises 1,250 feet and is two miles long. Wright is one of two riders successfully to reach the mountain top. He was mounted on a 3½ h.p. two-speed Humber.

The summit of the pass is nearly 1,800 feet above sea-level, and the road is exceptionally rough, being covered with large flat slate stones.

Up to this year Sam Wright had the distinction, probably unique, of never having stopped involuntarily in a motor cycle reliability trial. He is usually chosen as one of the Coventry and Warwickshire Motor Club team in the Team Trials, and has more than once helped to annex the club championship trophy on his Humber.

THE MOTOR CYCLE A FORTNIGHT HENCE! T.T. AND SUMMER NUMBER.



Required, a New Accessory.

Many of us are using three-speeded hubs this year, and we are told to oil these regularly with ordinary cycle bearing oil. On tour we rapidly use a whole can of this oil, but there is no accommodation on the machine for storing one of the sixpenny oval cans in which this lubricant is sold. Will some accessory dealer please market a tiny tank, suitable for storing this oil, to be attached to the top tube, and sold at a reasonable figure? There is no need for an outlet tap to be fitted. Most of us use suction force-pumps for oiling our hubs, and we can recharge these through the filler cap hole. The oil gun should be only partially filled, any attempt to inject a large quantity of oil results in leakage on to spokes, rim, and tyre. Little and often is the motto.

Adjustable Pulleys.

The very day on which I wrote my notes in favour of the tool-less pulley provided an excellent object lesson of the point. As I walked along in the pouring rain I encountered what Mantalini would term a "dem'd moist unpleasant body" in the form of a worthy medico, attired in full waterproofs, solemnly pushing home his motor bicycle. The make he patronises is disfigured by a tool-operated adjustable pulley, of the well-known type to which you affix the largest wrench obtainable, and then clump its far end with the coal-hammer. This clumping process had demoralised the metal of the pulley, so that the outer end of the fixed flange barrel had suddenly cracked off on the road, carrying away the locknut with it, and leaving no thread to which a faked lock could be attached. As a consequence the unlucky owner had to push; for as soon as he started the engine, the unlocked loose flange unscrewed itself, and swirled off in a graceful parabola towards the nearest tuft of nettles. Lightweight machines, which have thin flanges and barrels, stand in specially urgent need of tool-less pulleys.

Edgar Russell on his home-made machine, which is fitted with m.o. overhead valve engine. He won the Haskard-Mitcham cup in the recent Derby and District M.C.C. reliability trial.

Steering Fork Design.

I wonder how many riders have noticed the great variations in the efficiency of fork designs of different makes. A few years ago no machine could be steered at all straight at really slow speeds, nor did the failing really matter, as we seldom bothered to drive at less than ten or twelve miles an hour. The situation is altered to-day. Thanks to variable gears and free engines, we most of us drive on occasions at single figure speeds; we remain in the saddle through traffic where once we used to dismount and wait or push. Now nothing looks worse than to see a rider wobbling violently in the attempt to keep his machine upright, whether he be moving off on the clutch or travelling at four or five miles an hour in a press of carts. Last week I rode two machines of different makes; the fork of one was so designed that it was impossible to keep the machine straight at less than 12 m.p.h., and at 6 m.p.h. real skill was required to hold the machine up at all. The other is a make which has been fitted with a clutch for some years past, and the steering has been so improved that a clever rider on a good surface can drive in a bee line without front wheel wobbles at 6 m.p.h. until he gets tired. Nor is there any compensating disadvantage at high speeds, for the machine which steers best at the low speeds also keeps its track most tenaciously and requires less holding than the other at 60 m.p.h. Certain makers should attend to this point at once.

Clutch Control Fixing.

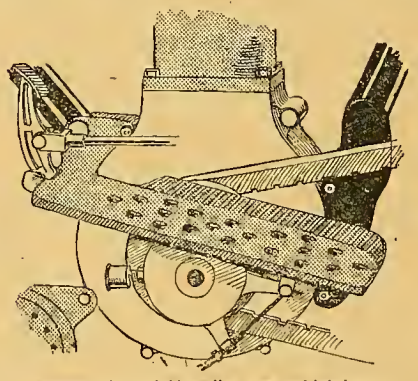
The clutch control bracket on certain free-engined and variably geared machines needs partial re-designing. The spindle on which the clutch pedal is mounted often screws through the two halves of a split tube clip, and has no locking device of its own. The makers rely for locking upon the other bolt, which grips the two halves of the split clip at the other side of the frame tube. If the clip is bolted up evenly and truly, the strain of starting the machine on the clutch will often cause the clutch spindle to turn in the threads, and so upset the adjustment of the control, either throwing the clutch permanently in or permanently out, according to the details of the design. The simplest way of locking the spindle is to bolt it up out of truth, by overtightening the short clip-bolt, so that the clutch pedal spindle is strained awry, and cannot move. This is grossly unmechanical, and the makers ought to lengthen the clutch-pedal spindle, and equip it with a locknut on either side of the clip. My own clutch invariably causes this spindle to revolve a trifle, so that the clutch is never truly free.

Occasional Comments.—

Tyre Tests at Last!

For some years past I have steadily urged the need of tyre observation and awards in the big trials, and naturally I am gratified to see that the A.C.U. has at last adopted a suggestion which originated in these columns. Sound as the principle is, the path of practice will undoubtedly be thorny, but the A.C.U. is more alive and efficient to-day than it has ever been, and I believe it will emerge triumphantly in a year or two. Apparently a start is to be made with optional tests. The behaviour of every tube and cover entered in the Six Days' of 1912 is not to be compulsorily recorded and published, but it is left to tyre makers to submit their wares for a special set of awards. Possibly certain makers will endeavour to "crab" the innovation, but there is more liberty in the tyre world than there has ever been, owing to the expiry of master patents. and the implication to be made against abstaining firms is obvious. If a firm abstains, the public may be pardoned for inferring that its products are untrustworthy compared to those which face the music and the publicity. Incidentally I believe the innovation will give the motor bicycles a fairer chance. Good machines have suffered in past trials from being shod with light and flimsy tyres, the resulting troubles depriving them of medals well earned by intrinsic mechanical excellence. This year heavier tyres should be more universally fitted, and the percentage of clean scores should be increased.

Camera Carrying.

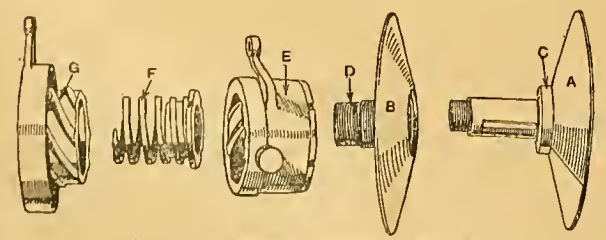


My experience of carrying a camera on a motor cycle is that only a small film camera can be taken on long rides with any pleasure or comfort, because the only safe place to carry it is by a strap slung across the shoulders. The strap must be fairly tight, or the bouncing of the camera is a nuisance, and, consequently, a spring-hook joint in the strap, where it crosses the chest in front, is preferable to the ordinary strap, which necessitates a process analogous to skinning off a sweater. Needless to say, the camera should be wrapped in dustproof material, inside its waterproof case, otherwise dust will certainly enter the delicate mechanism of the shutter and slow its operation; then, on the return from the tour, all the films will be found to be grossly over-exposed.

Improvements to the Ariel Gear.

THERE have been a number of alterations of a minor order made to the 3½ h.p. Ariel model during the early part of the year, and a call at the works of Components, Ltd., proved interesting in many ways. We inspected some of the fine plant used in the construction of Ariel motor cycles, and were impressed by the number of machines going through the shops. The tank of the latest model has rounded edges, and is fixed on the lower of the top tubes, which can be detached entirely by removing two bolts. The cam, gear, and timing, and also the decompressor, have undergone slight alterations with beneficial results, but the most important change lies in the free engine and variable pulley, for though the principle is the same, the actuation has been much improved.

Alterations to the Pulley Gear.



The inner pulley flange A is made with a hollow extension fitted with two long keys, and on which is mounted the ball race C; the belt bottoms on this in the free engine position. On the hollow extension slides a sleeve D, which is kept from revolving by the two keys before mentioned. This sleeve is screwed on the outside, and on it is mounted the outer flange B, held in position by a locknut. Next to this is mounted a ball thrust race carried in the end of what must be called the worm box E, held in its position on D by a locking ring, and then a nut carrying the powerful flat coil spring F, which presses against a ball race carried inside the moderately quick pitch worm

Showing the variable pulley gear and lubricator, also the lower position for the footplates.

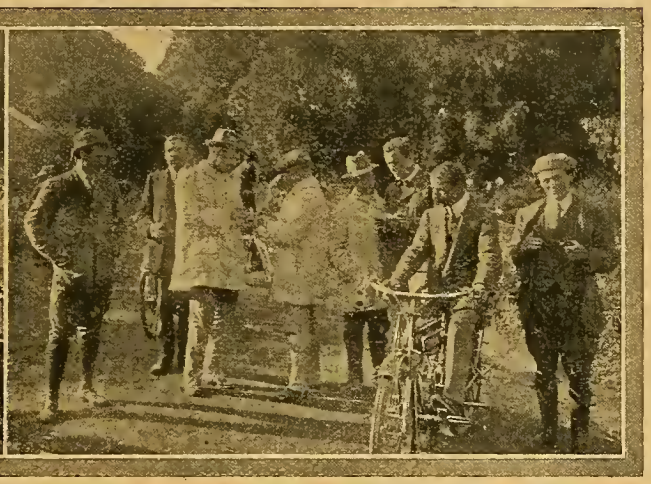
G. The whole is locked to the engine-shaft by an extension of the starting handle jaw, which is screwed internally for that purpose.

The worm box E is anchored to the footboard, but the worm G can be rotated by a Bowden wire attached to a lever on the cover cap. When this is rotated against the action of the spring F, the pulley flanges are drawn apart, and the belt rides on the ball race C, but as soon as the self-locking control lever is eased off the action of the spring forces the flanges together, causing the belt to ride to the desired height in the pulley, and thus varying the gear ratios. A key is supplied to facilitate the removal of the pulley.

The Ariel variable pulley gear shown dissected.

Lower Foot Plates.

A somewhat improved form of rubber studded foot plate is now in use, and is fitted considerably lower down than usual, thus giving a more comfortable riding position. A point worthy of notice is that though the Ariel spring seat-pillar is listed as an extra, only a very small percentage of machines are sold without it. On a short trial of a T.T. model we were delighted with the gear (which showed no signs of slip, although no provision is made for varying belt tension), also with the running of the engine, the extraordinary slow running of which is rendered possible by the use of the decompressor.



F. C. Sangster on the 3½ h.p. Ariel, with improved variable pulley gear, with which he gained third place in the Birmingham-Land's End-Birmingham trial for the Lycett trophy.

Cape Peninsula M.C.C. Hill-climbing Contest.

The gathering on the main road of Groot Schuur. A Scott and Lowen sidecar in the foreground.

The drawing for places. On the extreme right is C. E. Scott (Rudge), the winner; next to him, V. Lee (2¾ h.p. Humber), first in the lightweight section.

THE ever increasing interest in motor cycle doings accounted for the largest gathering of spectators yet met at any of the C.P.M.C.C.'s contests.

The venue was Groot Schuur (the famous grounds presented by Cecil Rhodes to the people of South Africa), while the climb took place that afternoon on the Memorial Road with its gradient of one in seven over a distance of approximately one thousand yards.

Competitors had to cross the main road of Groot Schuur and dash through the open gates, where a big locking stone in the centre barricaded a free run through, allowing only about one and a half yards at each side for the machine.

When H. S. Olive on his 7 h.p. Indian came flyng past the large crowd near the gates at a speed of between thirty-five to forty miles per hour, there was no doubt left that he would make fastest time of the day. And so he did. He would have done even better if a slipping clutch had not hindered the progress and thus prevented opening the throttle to a fuller extent.

Vincent Lee astride a brand new twin Humber lightweight was watched eagerly, as great things were expected of that smart little engine and the daring rider. While making fastest time for the lightweights, beating the next man by thirty seconds, he however was only able to gain eighth place on time, and sixth place on formula, which was as follows: Speed squared multiplied by capacity, divided by weight of rider and machine. This is the hill-climbing formula recommended by *The Motor Cycle*. The following are the results of the competition:

Rider and machine.	Seconds.	Position on formula.
C. E. Scott (3½ Rudge)	74⅗ ...	1
J. Thornton (3½ Bradbury)	73⅘ ...	2
H. S. Olive (7 Indian)	69 ...	3
D. McMillan (3½ Bradbury)	83⅕ ...	
A. Douglas (3½ Triumph)	86 ...	
V. Lee (2¾ Humber)	103 ...	
W. Boyliss (2¼ F.N.)	143 ...	
S. Jones (3½ Triumph)	86 ...	
H. L. Stein (3½ P. and M.)	101 ...	
H. E. Haddon (3½ Swift)	...	

THE MOTOR CYCLISTS' PROGRESSIVE ASSOCIATION.

A GENERAL meeting of the M.C.P.A. was held at the Holborn Restaurant, last week, to enable the committee to report progress and give an account of its stewardship to date.

The chairman, Mr. Otto Thomas, reminded those present that the primary objects of the founders were: the government of motor cyclists by motor cyclists, the strengthening of the A.C.U., and by co-operation with the provincial clubs, the creation of a truly representative, national body to foster and encourage the sport and pastime on progressive lines.

A scheme was evolved to ensure better representation of the provincial clubs, new sub-committees were suggested, and active motor cyclists were nominated to the new committee. They had further induced Major Lindsay Lloyd and Mr. W. H. Browne to consent to act as vice-chairmen with Mr. J. R. Nisbet and Mr. Otto Thomas, Mr. Mullam to fill the responsible post of hon. treasurer, and finally they had secured the election of Mr. T. W. Loughborough as secretary; which result alone, in the Chairman's opinion, justified the formation of the M.C.P.A.

A general discussion followed, and it was decided that the next general meeting should be held at Olympia during show week, but that if any special need should arise the chairman and hon. secretary might call an extraordinary meeting at any time.

The hon. secretary, Mr. W. G. McMinnies, reported that the nominal subscription of 1s. a member had not been sufficient to cover expenses, and it was decided to invite the provincial clubs, on whose behalf the expenses had been mainly incurred, to contribute 5s. per club to the funds.

The committee will be obliged if club secretaries will accept this notice as an invitation to subscribe, and, if willing, remit the amount named to the hon. secretary.

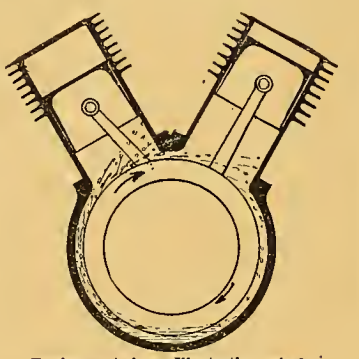
A Smoking Concert at Daventry.

It was also decided to hold a smoking concert at the Wheat Sheaf Hotel, Daventry, at 8.30 p.m., on Saturday, the 15th inst., following the M.C.C. inter-club team trial for *The Motor Cycle* Cup.

A concert sub-committee was appointed consisting of: Mr. W. H. Browne, Mr. McMinnies, Mr. H. Karslake, Mr. F. A. Hardy, and Mr. W. Cooper. Tickets, 1s. each, may be obtained on the day. It is hoped that a large number of our provincial friends will be present.

Hearty votes of thanks to Mr. W. H. Browne, Mr. McMinnies, and the Chairman concluded the business of the meeting.

NOTICE.



The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

TWIN-CYLINDER ENGINES.

IT is proposed in this article to give a few notes on two-cylinder motor cycle engines, and where possible to compare them with singles. These may possibly help a prospective buyer to decide which of the two types to buy, and at the same time give him a few hints on tuning up should he decide on a twin.

Obviously, the single-cylinder scores in simplicity, but in these days of m.o.i.v. and magnetos the advantages are not so pronounced as formerly, but the single-cylinder engine usually develops more power per cubic capacity. The chief points against the twin are faulty synchronisation of cylinders and unequal lubrication, but, on the other hand, it gives a very much more even torque and consequently greater comfort and more freedom from skids at low engine speeds.

This article deals with modern engines only, so that we may take it that magneto ignition is fitted as standard, and so the relative firing points in each cylinder cannot be altered without tinkering the cams in the magneto make-and-break, which it is advisable for no one to touch except the experienced. It will be remembered that in single-cylinder engines the spark is timed to take place in the "maximum" position of the magneto (*i.e.*, in the most efficient position of the armature). Now this maximum point occurs twice in every complete cycle (if the magneto runs at camshaft speed) but at equal intervals.

Tuning up twins. Illustrating splash lubrication effect.

Even Firing.

There are only three types of twin on which both can be utilised, *i.e.*—(1) the Douglas type with horizontally-opposed cylinders and opposed cranks; (2) the Alcyon type with two vertical cylinders and one crank pin; and (3) the Premier type in which the cylinders are set at an angle and the crank pins at such another angle as to give equally spaced firing. Modern magnetos are so efficient that this point is not of vital importance, though a better spark is obtained on the above three types. A few firms (notably the N.S.U. and M.M.) have devised a method of gearing by which the armature is accelerated just before the contacts break, and this in some measure gets over the difficulty.

Inlet Valves.

There are still a fair number of twins on the road fitted with atmospheric inlet valves, and with these it is of the utmost importance that the springs should be of equal tension, and that the valves should have equal amount of opening. This subject has been written upon so often that it will be sufficient to say that the opening should be kept small (5-32in. is the utmost satisfactory opening for a big twin, and this should be decreased for smaller engines), and that strong springs give good high speed and poor starting, while the converse is also true, *i.e.*, weak springs give good starting and slow running, but are unsatisfactory for speed.

In the case of mechanically-operated valves, makers send their machines out timed correctly, and very little trouble is likely to occur in this way; however, it is advisable to check the timing occasionally, and either adjust the tappets or fit new ones till the lift and openings are the same on each cylinder.

Plugs.

A less important item, but one which decidedly affects the running, is the gap between the sparking plug points. It is advisable to use the same make of plug in each cylinder, and the gaps should be the same in each case (roughly 1-32in.) The position of plugs is important, and for touring work the inlet valve cap or in proximity to the inlet valve appears to be the most satisfactory, though it is doubtful if this is the best position if the last ounce of power is required for hill-climbing or short-distance racing.

It is important that the carburetter should be placed at an approximately equal distance from each cylinder, and that there should not be more or sharper bends to one cylinder than the other. Also note that there are no air leaks at the pipe joints, as this is frequently a cause of misfiring at low speeds. The compression should, of course, be kept equally good in each cylinder. Here I would remind novices that it is not a good plan to take off one cylinder and scrape it unless the same is done to the other.

Lubrication.

One of the most frequent sources of trouble in twin-cylinder engines is lubrication, and in many instances this has not received the attention which it deserves at the hands of the designers.

With the ordinary type of splash lubrication there is a natural tendency for the rear cylinder to receive considerably more oil than the front. The reason for this can easily be seen from the appended diagram (in which it is taken for granted that there is always a certain amount of oil in the bottom of the crank case). The usual method of combating this error is for the makers to fit a baffle plate to the rear cylinder of such proportions that only a sufficient quantity of lubricant shall reach the cylinder walls. This method is only fairly satisfactory, as unless a large quantity of oil is used the front cylinder is still starved.

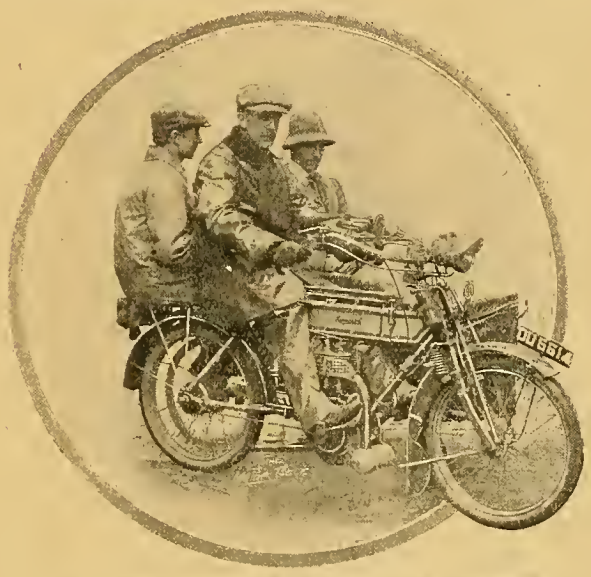
The trouble is overcome on Indian motor cycles by pumping oil direct to the rear of the front cylinder. A form of lubrication which is again becoming common is to pump the oil into troughs round the base of the cylinder, into which the pistons dip. This allows the oil to go direct to the pistons, which, of course, need the best lubrication, and also tends to equalise the lubrication to each cylinder.

This type of lubrication is by no means new. We had it in the early types of De Dion single cylinders, but for some reason it seems to have been dropped, and has only recently returned to fashion. It is of great importance that the connecting rods, and more especially the pistons, should be the same in each case, but this is usually attended to by the makers, and in any case it is not a job for the ordinary amateur to undertake.

UBIQUE.

A TRIAL OF THE EXCELSIOR.

A FEW days ago we accepted an invitation to test the hill-climbing powers of a 4½ h.p. single-cylinder Excelsior. Accordingly, a solo machine, fitted with a Sturmey-Archer three-speed gear, and a sidecar machine, fitted with the Roc two-speed, were brought round.



We arranged to go our usual test run to Edge Hill, and thereupon mounted the solo machine, which was fitted with a Lukin automatic carburetter. The engine started at once, and turned over extremely slowly and steadily, showing the presence of plenty of flywheel and good carburation. We slid away, and were in the high gear (4 to 1) in a matter of a few yards. The run to Edge Hill was uneventful, and on arriving at the hill we made a clean ascent on the top gear, the engine never showing a sign of knocking. At the top we waited for the sidecar outfit, which came up in style—so well, in fact, that Mr. Carson, who was piloting it, was confident that he could take three up. This time we moved to Sunrising Hill, and on reaching the bottom slightly reduced the gear to 5⅓ to 1, and straightway turned round and ascended the hill. The high gear was in use right up to the sharp corner, which so reduced the speed that the low gear was put into action.

In Full Touring Trim.

The weight of the machine in full touring trim and with a sidecar was 3 cwt. 2 qrs., which, with the combined weights of the three passengers, brought the total to approximately 7½ cwt.

It is interesting to note, in view of recent discussions, that this fine performance was done with a Binks two-jet carburetter. After the climb had been accomplished we returned to the bottom of the hill, shed our third passenger, and took charge of the sidecar machine ourselves. We were thus enabled to judge of the steady pull and simple control of the machine. The climb was accomplished in fine style, and as we neared the summit the rider of the solo mount rushed past us on top gear.

The run home was uneventful, except for the pouring rain. As a sidecar mount we were delighted with the 4½ h.p. Excelsior, which is capable of a fair turn of speed, and will keep up an average of at least the legal limit or more without showing the slightest sign of overheating.

The 4½ h.p. Excelsior two-speeder as it ascended Sunrising Hill with three passengers.

London-Edinburgh Run: Our Suggestion.

IN our report of this classic event, which is probably the most popular of any in the motor cycle world, we made a suggestion that it might easily, and with advantage, be converted from a mere club run into a test which would be interesting, and, at the same time, of real value to the public, by showing which machines were really worthy of the awards they gained, while the number of gold medal winners would be substantially reduced. Sutton Bank lies so close to the main road that its ascent would make but a very small difference in the distance, while the situation of the roads over Hambleton Hills renders it equally possible for almost as stiff an ascent to be made on the return journey. Anyone well acquainted with the Hambleton Hills district could find a suitable test hill, which, after the 200 miles continuous running from Edinburgh, would be a real proof of the capabilities of the machines and skill of the rider. There would be no necessity to render this valuable addition a speed hill-climb, and it might almost be sufficient to make it a stipulation that every entrant for the outward journey should make a clean ascent of the hill chosen, similarly on the return journey, no credit being given for any speed in excess of twenty miles an hour. It might be urged that the inclusion of two stiff hills might possibly affect the entry list, but, taking into consideration the enormous entry received on the occasion of the last two runs, the M.C.C. could well afford to lose even as many as a couple of dozen.

Too Large an Entry not Desirable.

It would, however, be a far better advertisement for the M.C.C. to run the London to Edinburgh Run as a genuinely severe test of both rider and machine than to attract a huge and almost unwieldy entry and keep the run a mere procession between the English and Scottish capitals over one of the easiest stretches of 400 miles which can be found in the British Isles. Those competitors with whom we have discussed the idea have viewed it in altogether a favourable light, and we most emphatically place the suggestion before the M.C.C. Committee. There are many well-known motor cyclists who are very intimately acquainted with the district in which the Hambleton Hills are situated who would be only too happy to co-operate with the M.C.C. in the selection of a hill, and in lending their assistance if this suggestion be adopted

The Problem of the Automatic Carburetter.

THERE appears to be much misapprehension on the question of carburation, and even "E.M.O." in his interesting article does not seem free from confusion of thought here and there. For instance he says, "We want more air with the engine buzzing on half-throttle on a level road than we do when the engine is pulling comparatively slowly uphill on the same amount of gas."

This has the appearance of a perfectly obvious statement, but why, after all, does the engine require more air under the one condition than the other?

Those of us who pin our faith to the dual-controlled carburetter so habitually speak of the control levers as "air and gas" that we seem to carry the same dual idea into all our thoughts upon the matter.

The whole problem of carburation is to supply to the engine the most perfectly combustible, and consequently efficiently explosive mixture of petrol vapour and air in sufficient quantity under varying conditions.

Perfect Combustion Essential.

Too rich a mixture will result in imperfect combustion, sooting, and loss of power. The giving of "extra air," on the other hand, beyond the limits of perfect combustion has nothing whatever to recommend it. A departure in either direction from the point of "perfect combustion" results in loss of efficiency and other undesirable features.

In the ordinary form of carburetter a jet of given size supplies petrol, and the amount sprayed will vary according to the force of negative pressure in the spraying chamber induced by the suction stroke.

It follows then that, other things being equal, the effect of closing or opening a throttle valve placed between the spraying chamber and the cylinder will always be to reduce or increase, as the case may be, the spraying of petrol from the jet.

The air supply is provided through a constricted vent or "choke tube" surrounding the jet, and which in the usual type of two-lever carburetter is of constant size, and an additional "extra air" vent controlled by the "air" lever.

With the "extra air" closed the spraying of petrol increases with the opening of the throttle until a point is reached when the mixture becomes too rich for combustion at all, and the engine "chokes."

The opening of the extra air serves the double purpose of tending to reduce the spraying of petrol and at the same time providing the necessary air to render the over-rich mixture efficiently combustible.

It is therefore quite possible within certain limits to vary the petrol spray without touching the throttle lever. In fact, at least one automatic carburetter utilises this principle. Correspondingly, closing the "extra air" will increase the spraying of petrol.

Throttle and Air Too Wide Open.

Many manipulators of the two-lever control habitually ride with the throttle needlessly wide open and the "extra-air" still more needlessly wide to render the mixture somewhat inefficient, and then congratulate themselves they are driving well. What they are really doing is giving the engine a large charge of "flabby" gas when a small charge of efficiently combustible gas would do the work infinitely better

The remaining disturbing or compensating factor, if we ignore atmospheric conditions which will usually be fairly constant on a given run, will be engine speed. It will be fairly obvious that increase of engine speed will tend to result in more violent spraying, and *vice versa*.

Now what happens with an ordinary two-lever carburetter under the circumstances which "E.M.O." mentions. "With the engine buzzing along at high speed" under easy conditions little power is required, and consequently the throttle will be closed as far as possible. But with a fairly large jet and choke tube the throttle cannot be closed beyond certain limits or no effective spraying will result.

With the smallest effective throttle opening the high speed resulting from favourable conditions tends to increase the spraying abnormally. The obvious remedy of the dual-control man, since he cannot take as small a charge as is really required, must be "extra air" to maintain a correct mixture, or more probably to reduce its efficiency somewhat, since a smaller charge cannot be taken.

Hill-climbing and Efficient Mixture.

But a hill comes upon which the speed falls off at once, the abnormal spraying ceases, and the mixture is rendered altogether too poor. Now unless the engine is to knock, one of two things must happen. Either the throttle must be opened to stimulate spraying and give a larger and richer charge of gas, or the "extra air" must be reduced. The course will depend upon the steepness of the gradient to be surmounted. The truth is "E.M.O.'s" statement as it stands is an absurdity. If the engine were "pulling on the same amount of gas" it would require the same amount of air to maintain highest efficiency. It is just because it is not getting the "same amount of gas" at a slower speed that the extra air must be reduced.

Now what happens with an efficient automatic carburetter. The Binks two-jet is admirable as an example of efficiency and simplicity. The small choke tube and jet are so small that effective spraying can be obtained with a very tiny throttle-opening. The result is that under favourable conditions the engine will spin along, taking the smallest possible charge of *good* gas. It is running to the very utmost advantage, the small charge of gas giving a gentle explosion, and the cylinder being only partially filled, reducing the retarding effect of compression to a minimum. The engine keeps delightfully cool.

Now comes the hill! As the throttle begins to open on the large jet and choke tube, the engine accelerates and ample power is given for the hill. At full throttle extra air can also be admitted if the speed be very high. As the speed drops on the steepest portion, the extra air can be closed, preserving an efficient mixture. Let the speed drop never so low, the combined effect of the two jets and chokes continues to provide a good mixture.

"E.M.O." prefers "tap twiddling," and granted, if he live upon his machine, it may be an amusing pastime. But for thousands of riders who just want to ride with comfort and certainty the automatic carburetter is "the thing." W.H.B.

THE WATFORD SPEEDOMETER.

THE Watford speedometer is manufactured by Messrs. Nicole, Nielsen and Co., Ltd., 14, Soho Square, W., who manufacture probably the highest class chronometers in the country. Naturally, therefore, the most accurate work is put into these speed-recording instruments. The speedometer works on the centrifugal principle. Fig. 2 shows the main moving parts.

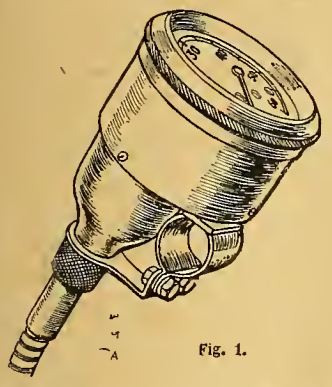


Fig. 1.

To the base of the spindle A is attached a lead ring B, which, owing to centrifugal force, tends to flatten out as the speed is increased. As it does so it pulls down the sleeve C, to which it is attached by means of the rod D, and moves the crank on the threaded quadrant E, which meshes with the spindle attached to the indicator hand. The spring F serves to bring the wheel B back to its original position as the speed decreases. To the indicator hand spindle is attached a small hair spring, the object of which is to keep the teeth on the spindle closely in mesh with those on the toothed quadrant and to avoid backlash. The pinion G meshes with the pinions which drive the mileage and trip recorder.

Worm Drive to the Flexible Shaft.

The latest improvement is in the bracket shown in fig. 3, which is attached to the front spindle. The drive from this portion is by means of a worm, the end of the worm spindle meshing with the key, which is solid with the flexible shaft end shown in fig. 4. The shaft casing is covered in leather so as to prevent the lubricant from oozing out. The shaft comes directly behind the driving gear box and reaches the instrument on the handle-bar with an easy curve, so that steadiness in running and accuracy are assured.

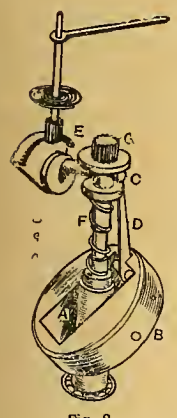

Fig. 2.

The driven shaft in the gear box in fig. 3 is provided with a ball bearing in the end nearest to the gear ring to take any side thrust which may exist, while at the further end is a plain bearing.

As will be seen in fig. 2, the ring governor spindle works on a ball bearing. The upper end is lubricated by means of a coned cap filled with grease, which is not shown in the illustration. We merely mention this to show that the speedometer is as nearly fool proof as possible. The principal bearings are packed with grease before the instruments are sent out, and they need no further attention for twelve months, after which period they should be sent back to the works to be overhauled and lubricated.

A Clear Dial.

The general appearance of the speedometer is particularly pleasing. The figures are clear and the recorder mechanism is particularly good. A great point about the trip is that on the release trigger being pressed the recorder flies back to zero immediately, in whatever position the wheels may be when the push is pressed. In the case of some speedometers the trigger will not release the trip except in a certain position of the gear wheel.

THE MOTOR CYCLE
T.T. and Summer Number
THURSDAY,
June 27th, 1912.

We recently spent a very interesting afternoon at the Watford Works of Messrs. Nicole Nielsen and Co., and saw the manufacture of these speedometers in every phase. The work is most interesting to watch, miniature capstan lathes being used. Everything is made to limit gauge, and, in consequence, the speedometers are extraordinarily accurate, while the workmanship is of the finest.

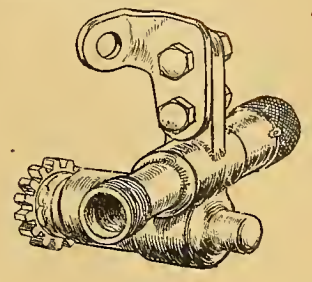

Fig. 3.

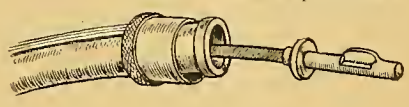
We left Watford under the impression that Messrs. Nicole Nielsen's speedometer



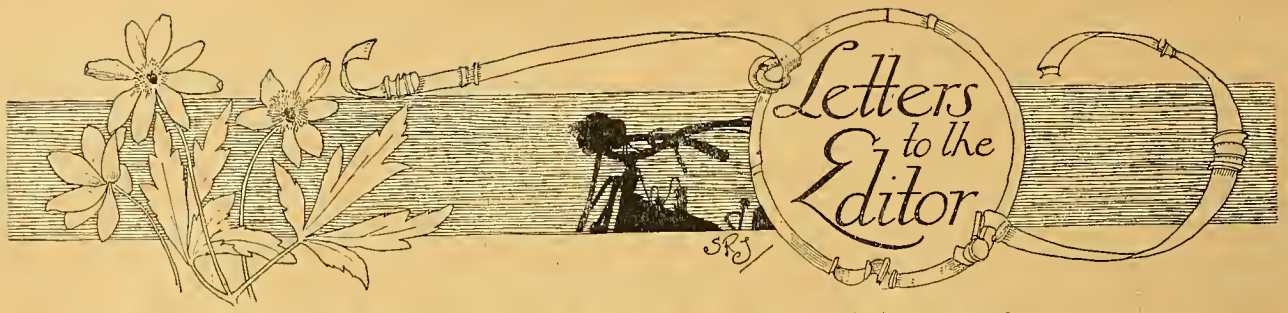


Fig. 4.

is a beautifully made instrument, and we congratulate its manufacturers on the height of perfection to which they have brought it. We have one of these instruments under test with much satisfaction, of which more anon.

AN AMERICAN FOUR-CYLINDER MACHINE.

E. B. Ware has just received delivery of a new four-cylinder air-cooled Pierce motor cycle, to which he has fitted a Gondola sidecar. This machine, which we illustrate above, is highly spoken of in the States, and may be seen in the A.C.U. six days' trials next August.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

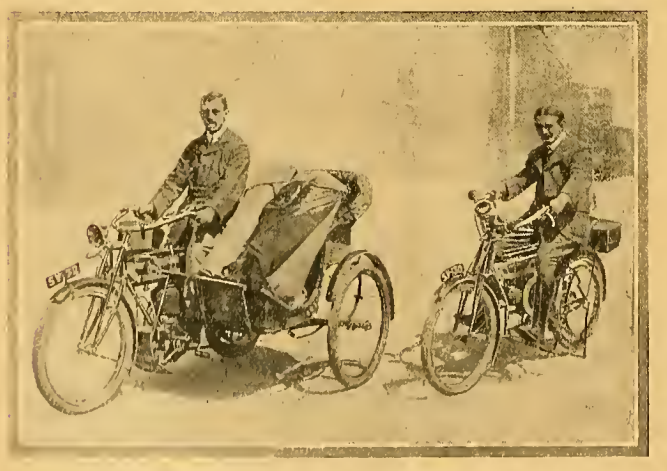
The London-Edinburgh Run.

Sir,—I think your idea in including Sutton Bank in the M.C.C. Edinburgh Run rather a good one, and hope in the next year's event the organisers will see their way clear to include this hill. A. C. ROBBINS.

Dangerous Driving.

Sir,—Can you do anything through your excellent paper to put a stop to the absolutely dangerous riding of some motor cyclists in Cheshire? These roads, I must admit, are conducive to fast riding, but when, through the excessive speed of some few, the Chief Constable is compelled to put the police on the look out for all motor cyclists, something ought to be done to put a stop to it.

I have lived in Cheshire for twenty-two years, and have ridden a motor cycle, on and off, since 1903, and have never yet had occasion to come in contact with the police, who, up till the last week or so, have always given motorists, motor cyclists in particular, a very good margin over the limit, provided there was no danger to the public.



During the Whitsuntide holidays the Chester to Manchester road was a veritable death-trap through motor cyclists tearing round blind corners. Four accidents occurred on this road during Whit week.

WITHIN THE TWENTY-MILE LIMIT.

[We suggest that our correspondent should send the registration number of the offenders to the A.C.U., 89, Pall Mall, S.W.—ED.]

A Collapsable Boat Mounted on a Sidecar.

Sir,—We venture to think that the photograph herewith will be of interest, because it is not every day that a sidecar is employed for carrying collapsable boats.

A collapsable boat used also as a tent, mounted on a sidecar.

The photograph was sent by the purchaser of one of our collapsable boats—he is a member of the Amateur Camping Club and takes the boat (which is fitted so as to make a tent for sleeping in) to Bournemouth and other places, the total weight being 60 lbs. ACCORDIAN BOAT CO.

Air-cooled Engines and Low Temperatures.

Sir,—Your remarks in your issue of April 11th on the above subject should bring forth some interesting experiences.

Personally I have not had any experience with air-cooled engines, at what one might term low temperatures, but my invariable experience in our hottest weather here, often over 100° in the shade, is that air-cooled engines develop more power with a decreased petrol consumption, and run cooler than what they do in cold weather. Overheating I have never experienced even on our hottest days, while on the contrary I have had decided symptoms of this in cold weather with practically all engines I have tried.

This result I used to ascribe to defective carburation, as the air supply had to be cut down, while on the other hand the petrol consumption increased, producing a mixture of a very high calorific value. It is quite probable that at very low temperatures this condition of things might be greatly accentuated and produce a result exactly as Sir Ernest Shackleton experienced. A possible remedy would be the use of a specially distilled very volatile spirit, and in this connection it might be interesting to know the specific gravity of the petrol used by Sir Ernest Shackleton.

Heilbron, O.F.S. CHARLES A. CHEYNE.

Petrol Consumption.

Sir,—I noticed in a recent issue a letter doubting a statement to the effect that a reader can average 110 miles per gallon on his 6 h.p. Zenith. It may interest him to know that I have a 1912 6 h.p. Bat, and with this machine I can average 112 miles per gallon, and the machine will attain a speed of 65 m.p.h. on the level, even with this low consumption of petrol. The carburetter is the latest B. and B. single jet, the gear ratio 3½ to 1, and the jet a No. 31. I have filed the extra air intake to admit more air.

I am prepared to back up my statements if any reader still does not believe this performance possible.

M. CAMPBELL.

Sir,—It is surprising how much ignorance is displayed in the matter of petrol consumption by the average motor cyclist. A reader recently doubted that 110 m.p.g. was possible with a 6 h.p. twin, and asked for information.

I would state, for the benefit of his obviously limited experience, that a clean engine in good tune, a properly adjusted carburetter, and a little knowledge of driving, are practically all the essential points.

I also have owned three singles, an old 3 h.p. N.S.U., which ran 90 m.p.g.; 3½ Kerry Abingdon, 120 m.p.g.; and T.T. Triumph, 110 m.p.g.

The counties in which I averaged these amounts are Surrey, Sussex, and Kent. I have, up to the present time, confined my riding to these counties. It will be distinctly understood that it is simply a question of average, and yet a reader gives as an ordinary example of roads, on which he would like to see me average this amount, a district containing sixteen hills in sixteen miles, and, as he says, "some of them are stiff ones." His idea of what is meant by "average" must be somewhat quaint.

I am sorry I do not now own the 6 h.p. Zenith in question, having invested in an 8 h.p. same make, which, he may be interested to learn, only averaged 25 m.p.g. with sidecar at a recent B.M.C.R.C. meeting; my excuse for this high consumption is that I was lapping regularly at 54

The Strongest Tyre Made.

The 2½in. section of the "Kerry Combination" is built up on a 4-ply canvas foundation, and the 2¼in. on a 3 ply. Thus you get strength where it is most needed—at the bead and in the walls. The steel studs are securely fastened through five plies of canvas, and, with the unique tread, combine to make a perfect non-skid.

COMFORT 'IN EXCELSIS'

THE NEW MODEL

"RIDING ON AIR."

A.S.L.

"RIDING ON AIR."

fitted with 26in. WHEELS, is the absolute limit in comfortable riding. Speedy, silent, and easy running, it is admittedly the most comfortable machine on the road.

Made in two models, viz., 3½ h.p. single cylinder, and 5-6 h.p. twin cylinder, both with standard 26in. tyres, and fitted with the famous A.S.L. air spring suspension. Either wheel can be taken out of the forks in one minute, an immense boon in case of tyre trouble. Automatic drip sight-feed lubrication and increased luggage carrying capacity.

Fully descriptive catalogue mailed free on request.

"THE TYRE THAT IS SUPERIOR"

m.p.h. with 23 stones up), but I know where it is, and have no doubt could borrow it and prove to any reader's complete satisfaction that what I say is true. I understand the present owner can get 90 m.p.g. out of it quite easily.

SYDNEY R. AXFORD.

Sir,—With reference to the letters recently published on petrol consumption, my experience is that the position of the air intake on the carburetter makes a considerable difference in the amount of petrol consumed. If a Triumph is jacked up and the engine got going in a fairly dark room with the door open (and, if possible, sunlight coming in), a fine spray of petrol will be seen coming through the extra air holes on the suction stroke, which loss must be greatly increased when travelling over a bad road surface at any speed. There is no difficulty in proving this, as if the exterior of the carburetter is examined after a day's run, when covered with dust, one can easily detect the mark of the petrol where the dust has been washed away. Manufacturers should give this matter their attention, as I feel convinced that in the great majority of cases this is the cause of the large petrol consumption, and this waste could easily be avoided by a better and more carefully designed carburetter.

VIVIAN BARTON.

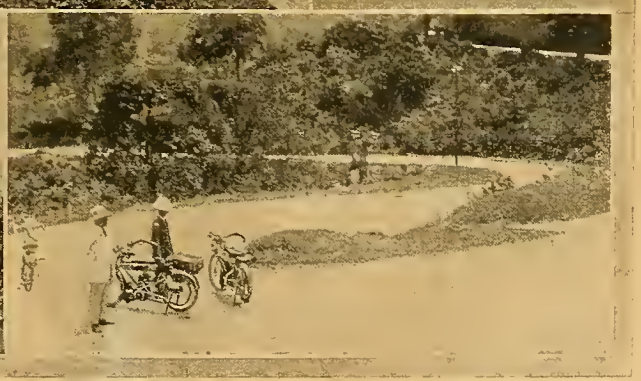
[The Triumph Cycle Co. have recently introduced a baffle plate which is claimed to prevent spraying and to increase the mileage per gallon.—ED.]

Needless Skidding Danger at Winchester.

Sir,—With your permission, I should like to caution motor cyclists likely to pass through Winchester against the danger of passing in or out of Jewry Street (the High Street end) owing to side-slip. The road during the daytime is dangerous, owing to the so-called watering of the surface. It is a half-inch of grease, difficult at times to walk on. I myself came off recently in front of a van. The driver happened to pull up at once, or much damage would have been done. It is quite common to see cycles and motors sliding from one side to the other. In fact, the place is a veritable trap.

CITIZEN.

A Difficult and Tortuous Climb.



Sir,—I enclose three photographs of the hill that the Ceylon M.C.C. used for their hill-climb last year. There is about three miles of it, and the gradient is pretty bad in places—but the corners are worse (as will be seen in the third illustration). The machines are a Bradbury, Premier, and twin Humber on a trip from Kandy to Colombo.

E. M. LEY.

Colombo, Ceylon.

(1) Kadugannawa Pass (see letter signed E. M. Ley). One of the bad hairpin corners on the hill which the Ceylon M.C.C. used for their hill-climb last year.

(2) The road passing through the rock, twenty yards beyond which is another hairpin bend. The natives under the arch have been shifting stones and boulders off the road—the result of a landslide the night before.

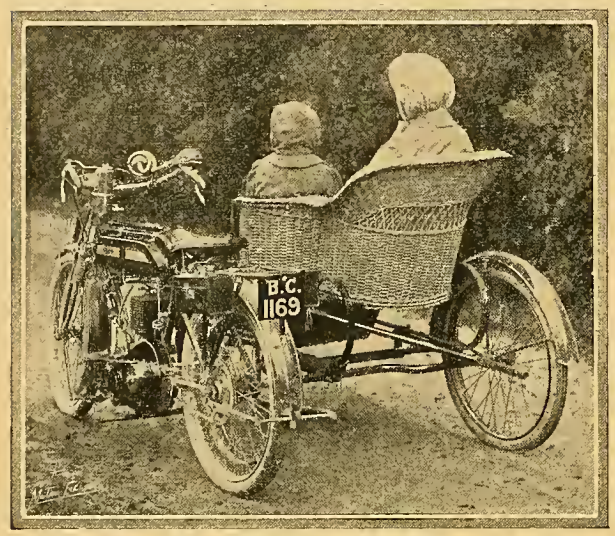
(3) Another view of the pass showing the "S" bends. The road may be seen again in the top right hand corner.

Should Ladies Race?

Sir,—Would you allow a mere man to reply to the letter of Miss May Walker? There is some truth in what she says, but much misapprehension. For instance, she asks, when speaking of the appearance of lady competitors, "can they be worse than some of the men?" Good heavens! I sincerely hope not. A man is made to be knocked about, but a woman's mission is to look beautiful, and I must say that many of them fulfil their mission admirably. In these days of suffragettes and coal strikes it is difficult to steer a middle course and please all parties. For instance, a man says he does not like to see a woman fall off a motor cycle at 40 m.p.h. and hurt herself badly, and he is told to stay at home and wash the dishes. Another gives up his place in a boat so that women can be saved—is this chivalry? Oh, dear no—it is simply "the usual thing." Perhaps Miss Walker does not know that it is part of Mr. Stiggins's duties to report hill-climbs, and is it fair to sneer at him because he does not like to see members of what used to be known as the gentler sex indulging in dangerous pursuits? I should recommend a strenuous course of Rugby football to all aspirants for honours in the hill-climbing world. With reference to men's garments, I am entirely in agreement; but are they meant to be lady-like? By the way, how many sheets go to the ream?

ACTON HILL.

Sir.—Regarding your leaderette "Should Ladies Race?" I am glad that your remarks apply chiefly to hill-climbs on hills on which there are dangerous corners, because this matter can be easily dealt with without robbing us of our chance of sport. Both the Manufacturers' Union and, I understand, the A.C.U. are setting themselves against such hills, and when the new "live" committee of the Union issues permits for hill-climbs, we may safely take it that if they are safe for male riders they will be equally so for us.



This being so, there will be no need for any special intervention of the Union on our behalf until, that is, we make a point of falling off regularly at every hill-climb, such as certain male riders do with impunity and without apparently any fear of being banned for ever from competing in a similar event.

Having had my share of tumbles during some four years of riding, I quite agree with Miss Hind's remarks that if ladies did not feel that they had the nerve they would not send in their entries. For you must remember that, as a sex, we have the greatest objection to laying ourselves open to ridicule.

(MISS) R. HAMMETT.

A Novel Sidecar Body.

Sir,—Enclosed you will find a photograph of a sidecar body, which I had made from my own design at the E.B.O. Motor Works, 286, Humberstone Road, Leicester. It is made to seat my wife and child so that the child faces the breeze. I have run it nearly a thousand miles, and find it a complete success, so have had the design registered (No. 599,507). The advantages I claim are a comfortable seat for

A special sidecar with child's seat fitted to an Ebo-Precision machine. (See letter accompanying.)

the child facing the breeze and scenery, and if on a long journey the child can lean its head on mother's lap and sleep sheltered by the apron which covers both thoroughly. The weight is over the axle, and a well balanced car is the result. As I am always interested in anything new I see in your valuable paper, which I have never missed reading for over seven years, I thought it might be of interest to fellow readers. C. H. INGAMELLS.

The Problem of the Automatic Carburetter.

Sir,—I have read the various opinions expressed in your columns with interest. I have now done nearly 2,000 miles on my Chater-Lea cyclecar, fitted with the Binks two jet instrument, and if the results are not perfect they are near enough for practical purposes. You get a "tick round" to over 40 m.p.h. by simply pulling the lever and the absolute response that the makers claim.

I have had over 30,000 miles of two lever carburetters, but should not dream of fitting one after the results I get from my single lever two jet instrument.

I have no interest in the carburetter in any way, except as a satisfied amateur user. P. H. STEELE.

Sir,—I have been keenly interested in your recent articles and correspondents' letters *re* the problem of the automatic carburetter, and have perused the recent letters on the same with great interest. I agree with the principle laid down by Mr. Binks *re* the multiple-jet carburetter, insomuch as I have had experience of the tests of different makes of carburetters in my capacity as engineer. These comprised several well-known makes, and the deductions from these tests led to the same conclusion as that arrived at by Mr. Binks, and the result was the adoption of a two-jet carburetter, the main jet being opened at a pre-determined velocity, and in conjunction with a dashpot to obviate a common fault, viz., "hunting." This type, I may add, was found very successful and economical for motor lorry work. I have personally carried out a series of tests with a well-known make, altered, on a twin-cylinder motor cycle engine on the road, and can get the engine to run with retarded spark (coil and dry battery) at a walking pace, with a quick acceleration when suddenly opening the throttle. I have, unfortunately, not had the opportunity of trying one of Mr. Binks's carburetters, but I must say that, in my opinion, he seems to be on the right track, especially with his "De Luxe" paraffin carburetter, and I thoroughly agree with the majority of the points in his letter. It has often occurred to me that the makers of the Polyrhoë carburetter should endeavour to put on the market a type suitable for motor cycles, as this instrument is an excellent appliance, and has given splendid results; in fact, I have made a modified form of such for trials, and have had excellent results, although I hold the opinion that it is possible to dispense with a float chamber, and am at present engaged on such a "gadget." In conclusion, I would advise any of your readers who are particularly interested in the science of carburation to peruse the excellent articles on this subject which appeared in the *Practical Engineer*, dated October 20th, 1911, and it will give them food for thought, especially as regards the curves and formulæ given on page 486, which justify Mr. Binks's and my own ideas on this particular subject. In conclusion I must add the usual disclaimer, that I am in no way connected or interested in any particular type other than as an interested reader in search of information on this subject. FRANCIS H. STEERS.

The Power Required for Sidecar Work.

Sir,—Under the above heading you have recently published some very interesting correspondence, and one or two of the writers have expressed a desire to hear other riders' opinions. Well, I may as well say at once that I am quite satisfied with 3½ h.p. for sidecar work. I covered 7,000 miles in 1911, with a 1910 Triumph, and with the exception of a few hundred miles this was all sidecar work. Of course, I have occasionally felt a longing for a little more power, but taking it all round I am well satisfied with what I have, and would rather be without any extra complications, for the sake of romping up some freak hill. Naturally, I avoid hills that I know my machine would not be capable of taking the sidecar up, as much as possible, but there are times when one cannot do this, and at the worst it only means a little vigorous exercise in running beside the machine, sometimes with passenger seated, and sometimes not. My best run last year was one that included a climb of 1,000 feet, in 3½ miles, and I tackled it with a hot engine, and did not have to dismount. Of course I am well aware that I did not ascend in true competition style, but I was quite satisfied with the performance. My machine with all on, on that day, including a camp stove, weighed 5 cwt. 1 qr. I am riding a 1912 machine of the same make, and getting equally as good service from it. I have had it two months, and have now covered 2,000 miles.

I certainly shall feel obliged to the makers of my machine when they fit a change-speed gear as standard, as I am confident that I shall get even better running still. I enclose a photograph of the complete outfit, taken at Richmond, Yorks., on Good Friday. H.W.J.

H. W. J.'s 1912 Triumph and sidecar referred to on this page.

Dinas Mawddwy Climbed.

Sir,—Referring to the article in last week's issue of *The Motor Cycle* about the attempts on Dinas Mawddwy Hill by some Coventry motor cyclists, I note it is stated that Newsome's successful climb was "the first authenticated climb" of this famous hill.

I beg to say, however, that last Good Friday my friend, M. Glasgow, and myself both made clean ascents of the hill at the first attempt from about two hundred yards

From Gall & Inglis's Contour Road Book.

Contour section of Bwlch-y-Groes, commonly known as Dinas Mawddwy.

below the hairpin bend. My friend's machine was a 1911 standard Triumph, and my own a 1912 F.E. model of the same make, and our gears were both about 6 to 1. Both our climbs were witnessed by M. G. Rollo, who was on a 6 h.p. Bat-Jap, and would not attempt the hill owing to the effect the bad surface would have on his tyres.

I may say that Mr. Glasgow and myself had both tried the hill last October, he on the same machine and I on a 1910 Triumph, but were unsuccessful owing in his case to his not being able to get his gear lower than 5½ to 1, and in mine to my machine having done about 8,000 miles and being in very bad tune. A. STEWART LLOYD.

Hub and Countershaft Gears.

Sir,—Referring to the article in your last issue by "Ixion" on the subject of gears, as manufacturers of a counter-shaft gear we must absolutely disagree with the opinion of your contributor that the most satisfactory gear of the future for motor cycles will be in the rear hub. In our opinion and experience, the following are a few points on which the counter-shaft gear is far preferable:

1. Situated immediately behind the engine, the weight of the gear box is in the centre of the machine, and does not interfere with the comfortable running, nor increase the tendency to side-slip.

2. The counter-shaft gear and clutch running at a higher speed than the back wheel must be under less stress, and clutch surfaces give far greater efficiency.

3. The space at the disposal of designers is not restricted, and all parts may be made with an ample margin of safety against breakages.

4. It is the experience of all users of counter-shaft gears that they are absolutely reliable. This is, of course, due to the great simplicity in construction.

On the other side of the picture, we submit several points in which hub gears are as yet not perfect.

1. The restricted space in which they have to be carried entails the lightest possible form of construction, with consequent occasional breakages.

2. The clutch working at slow speed is usually very little over its work; consequenty clutch slip is not rare.

3. Extra weight in the back wheel must slow the machine, and always interferes with the comfort of riding, owing to the increase in road vibration from the back wheel. A heavy back is also productive of side-slip.

JAMES CYCLE CO., LTD.

Why not Paraffin?

Sir,—Owing to the recent coal strike the price of petrol was greatly increased, and although the strike ceased some time ago the price shows little sign of reduction, and appears to be artificially kept up.

It seems to me that in future motor cyclists and other petrol users are likely to be at the mercy of the petrol manufacturers and merchants, and, judging from present experiences, are likely to be very unfairly treated. This, in time, must reflect on the motor industry and do great harm.

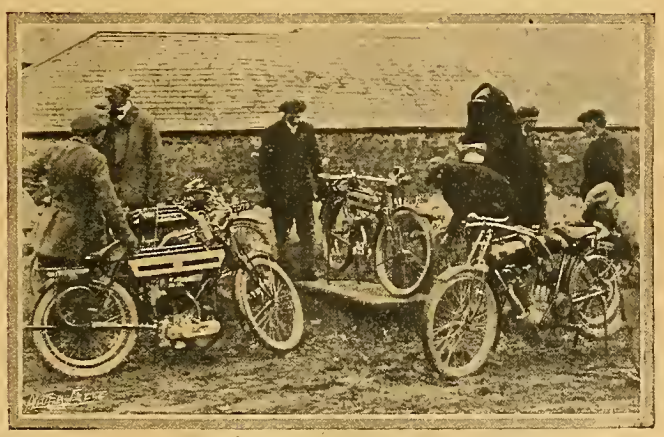
With regard to the carburetters used on present machines, there seems to be great competition among the manufacturers, and although one might be a little better than another, all the well-known makes appear to be satisfactory. The competition appears to be proceeding on the lines of better distribution of the spray, and making it more automatic; but the getting of the last ounce of work out of petrol will in the end only appeal to racing men.

The present time appears to be favourable for manufacturers turning their attention to the designing of a simpler carburetter to use paraffin only. This should be a commercial success, would be a great boon, and cut down the running expenses to one half or a third what they are at present, to say nothing about the keeping of petrol down to a reasonable price.

I believe paraffin with a high flash-point is now the cheapest variety, and, therefore, paraffin for motors would be cheaper than the best now used for lighting. STAR.

Inconsiderate Behaviour.

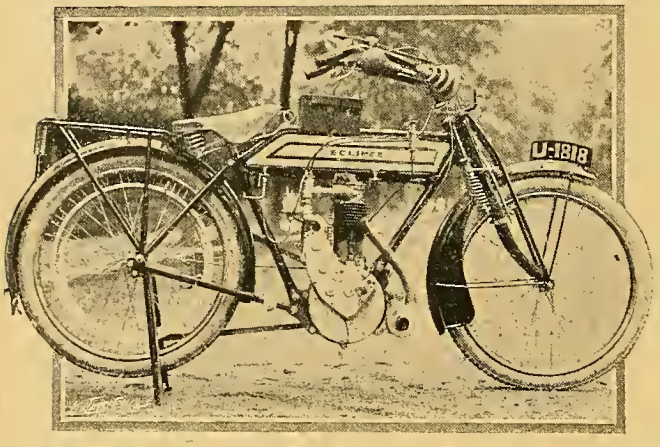
Sir,—During the recent Easter London-Land's End M.C.C. run, I loaned a box of spare chain parts to the driver of a sidecar outfit (conspicuous for its noise), whose chain had broken, leaving them stranded in the middle of Dartmoor. I have written three letters to these people, asking for its return, but to date have neither received the spares or even a reply to my letters. One expects different treatment from anyone, leave alone two such well-known men. The lack of these spares has indirectly cost me nearly 30s. You will, I think, agree such behaviour is very improper. H.P.B.



Road Conditions between Kew and Richmond.

Sir,—I have read "Injured Ancient's" letter *re* the above, and can fully sympathise with him. I have had to use this road four or five times during the last month or so, and, in my opinion, it is really dangerous; the road itself is bad enough, but the bed of the tramline is worse. I was not quite so unfortunate as your correspondent, but I had more shaking than I cared about. It is a pity it is not a criminal offence for authorities to allow main roads to get into such a state. DISGUSTED.

Furniture Vans—and Cricket.



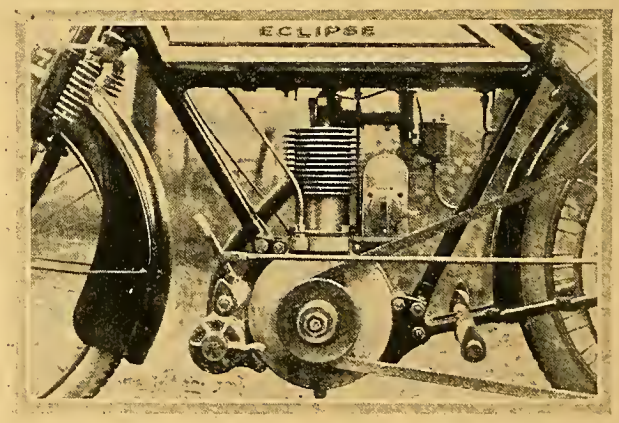
Sir,—I shall be glad if you will kindly state in your columns that the Scout Manœuvres against the Coventry and Warwickshire Motor Club were won by the Scouts, and not by the Coventry Motor Club, as at first reported. The rules laid down were that five motorists must succeed in reaching my offices between the hours of three and five o'clock, and that no other vehicle should be made use of by competitors. It was reported to me on the day following the Manœuvres that Messrs. Rupert May, Blockley, and one other motor cyclist had made use of a furniture van, in which they were concealed, and by this means succeeded in entering Rugby. I have written to the gentlemen in question several times, but am unable to obtain an answer. Definite proof has now been supplied to me by Mr. Edwards, Railway Terrace, Rugby, who provided the horses and van. The other three competitors reached Rugby in accordance with the rules, and are entitled to every congratulation on their success, in view of the elaborate precaution that we took to safeguard one hundred square miles over which operations took place.

I. B. HART-DAVIES.

SATURDAY'S ANGLO-SCOTTISH HILL-CLIMB.
The weighing-in at a farmyard near Lanton Hill, Jedburgh. W. F. Newsome (Triumph) on the scales.

A NEW ENGINE WITH DECOMPRESSOR.

The complete Eclipse motor cycle which is fitted with a new 3½ h.p. engine with overhead inlet valve.



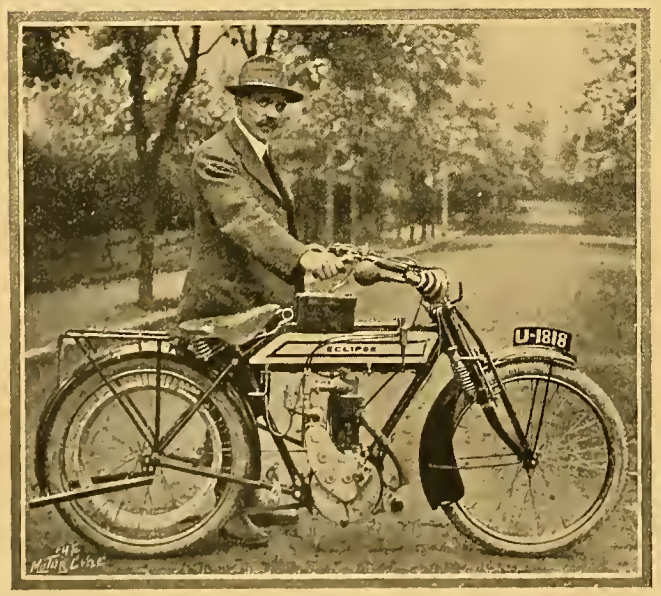
IF you imagine your motor cycle starts easily and runs slowly it would be advisable, before being absolutely satisfied on the point, for you to compare its capabilities with those of a new machine which is being manufactured by the firm of Job Day and Sons, Ltd., engineers, Leeds. A representative of this journal had the pleasure of meeting Mr. H. A. Smith (the designer of the machine in question) the other day, and was initiated into the various novel features of the engine, for it is the engine which the firm in question intend to supply.

Upon the machine being taken out of its shed, and without doing anything more to it than turn on the petrol and give a very slight push when wheeling it along, the engine commenced to fire and to continue firing quite regularly at a very slow walking pace. It was, of course, an easy matter to get comfortably into the saddle, and by releasing the half compression device (which is worked by the same handle-bar lever as the exhaust lifter) to get immediately into full swing. The engine dimensions are 85 × 88 mm.

As made at present the engine is not intended for racing, and although it has an overhead mechanical inlet valve, the compression ratio is somewhat lower than standard practice, being about 75 lbs. per square inch. However, owing to the low compression ratio it is found possible to employ very light connecting rod, gudgeon pin and piston (13 ozs. in all), and it is partly due to these light reciprocating parts that the engine proves capable of fast speeds.

The overhead inlet valve, which is worked by the usual style of tappet rod and rocking arm, is capable of being removed from the cylinder in an easy manner.—in fact by the undoing of one large nut the valve and its seating come away *en bloc*. The exhaust valve, which gives an effective opening of approximately one-tenth of the piston area, is of the usual type.

An unusual feature is the system of lubrication. Feeding by means of a Best and Lloyd pump, the oil flows into a well, in which the lip of the piston



Pulley side of the new engine built by Job Day and Sons.

dips at the end of each downward stroke, thereby raising a supply of oil at each upward stroke and depositing it on the cylinder walls, and so lubricating the cylinder most efficiently. One pumpful just fills the well, and the piston, in addition to lubricating the cylinder, scatters the required quantity into the crank case to lubricate the bearings and big end, but never in such quantity as to cause friction between flywheels and crank case; thus again free running is obtained.

The sparking plug is located in the centre of the cylinder. The silencer is neatly fitted with a cut-out, the whole being so get-at-able that it is only necessary to undo one nut to take it all to pieces.

The cylinder is fitted with the usual type of radiating fins, and the pattern has been so designed that uniformity of the metal allows for equal expansion and contraction due to heat.

The ignition is by a Bosch magneto driven by a train of gear wheels, and the carburetter is a B. and B. The motor bicycle frame, which is made by Edlin Sons, Ltd., is fitted with Druid spring forks and Edlin's patent detachable carrier and mudguard. The complete machine weighs, without oil or petrol, 168 lbs.

The Eclipse motor cycle with its designer, Mr. H. A. Smith.

MILITARY MOTOR CYCLING NOTES.

Another Successful Mobilisation. Seven Riders reach Maidenhead exact to time.

By "CELERITER."

Some of the motor cyclists who took part in the second mobilisation test getting ready to leave Maidenhead. Captain A. H. Trapmann distributing postcards to be delivered by the riders when they arrive at their destination.

WITHOUT any shadow of doubt, and in spite of the heavy rains experienced, Sunday's time scheduled mobilisation at Maidenhead was an unqualified success, and it is quite evident that these tests are growing rapidly in favour, perhaps on account of their originality and real sporting interest, but also on account of the invaluable statistics they afford.

The Daventry mobilisation, held on April 27th, proved little beyond the fact that motor cyclists can cover great distances in very quick time, and that the Legion of Cyclists had built up an organisation which enabled them to call up the keen motor cyclists throughout the United Kingdom at a few hours' notice. Sunday's test proved something more, and afforded a very welcome change to the eternal round of reliability tests and hill-climbing events, of which some enthusiasts are beginning to get tired.

Military Value.

The military value of Sunday's test is enormous, and opens out quite a new range of possibilities for the military employment of the motor cycle, for the results now offer concrete statistics of what the motor cycle, when intelligently handled, can perform. The Army authorities know to a nicety what the cavalryman, the gunner, and the infantryman can accomplish in the minute, the hour, and the day. A few experts know equally well what can be expected of the push-cyclist. We now know that the motor cyclist can be counted upon to cover any given number of miles according to a scheduled speed; that scheduled speed we did not possess before, and it will be very welcome news to the General Staff of the Army.

The Actual Performances.

As everybody knows, the competitors in Sunday's event were asked to ride to a certain specified schedule, in order that they might arrive at Maidenhead Railway Station on the stroke of one o'clock. This schedule varied between 20 and 30 m.p.h., according to the distance the competitors lived from the rendezvous. The following gives a list of entries as made up on Saturday night: London, 29; Herts., Beds., Middlesex, and Bucks., 12; Kent, Surrey, Sussex, and Hants, 19; East Anglia, 22; South Wales, 11; Cheshire, 11; Midlands, 27; Durham, 4; Derby, 5; Yorkshire, 9, Lancashire, 6; Somerset and Devon, 4; total, 159. Of these, sixty-seven put in an appearance before 3 p.m., the rest probably falling out or withdrawing owing to the weather conditions or to some accident at the early start which made it hopeless to regain lost time.

The prize offered by the proprietors of *The Motor Cycle* for the best performance on schedule time is awarded to S. Sawer and F. Dover, Sheffield (both on 3½ Premiers), 162 miles; and the next five in order of merit are: 2, A. P. Isard, Nottingham (3½ Triumph), 123 miles; 3, H. O. Springfield, Shaftesbury (2¾ Douglas), 105 miles; 4, R. S. Pullen, Handsworth (2½ A.J.S.), 97 miles; 5, G. Butteau, Cambridge (3½ Triumph), 76 miles; 6, W. Webster, Woodford Green (3½ Rudge), 53 miles.

All of the above arrived exactly on the stroke of one o'clock, riding exactly to their schedules, and the two winners were only determined by the mileage accomplished.

The furthest distance was Sergt. W. T. Tanfield and G. S. Bowman on a 6 Rex-Jap with sidecar, who came from Hull (220 miles), and arrived 29m. late; and perhaps the best performance was that by the three men who came from Winsford, in Cheshire, arriving 7½m. late, owing to having to get change to pay the toll at Cookham Bridge, the distance covered being 177 miles

Future Events.

In view of the great success achieved by Sunday's mobilisation, the executive of the *Legion of Cyclists* have decided to hold a novel test of some kind every month, but in future entries will be restricted to members of the Legion. The next event will be held in the vicinity of Nottingham, and particulars will be given in *The Motor Cycle* during the next week or so. Those motor cyclists who do not already belong to the *Legion*, but who are prepared to serve their country in the event of invasion, are invited to communicate direct with the Hon. Sec., 128, Jermyn Street, London, W., enclosing a stamped addressed postcard together with a penny stamp, or to purchase a copy of the first number of the *Territorial Monthly and Legion News*, which is to be published on the 15th inst.

OAKAMOOR INTER-CLUB HILL-CLIMB.

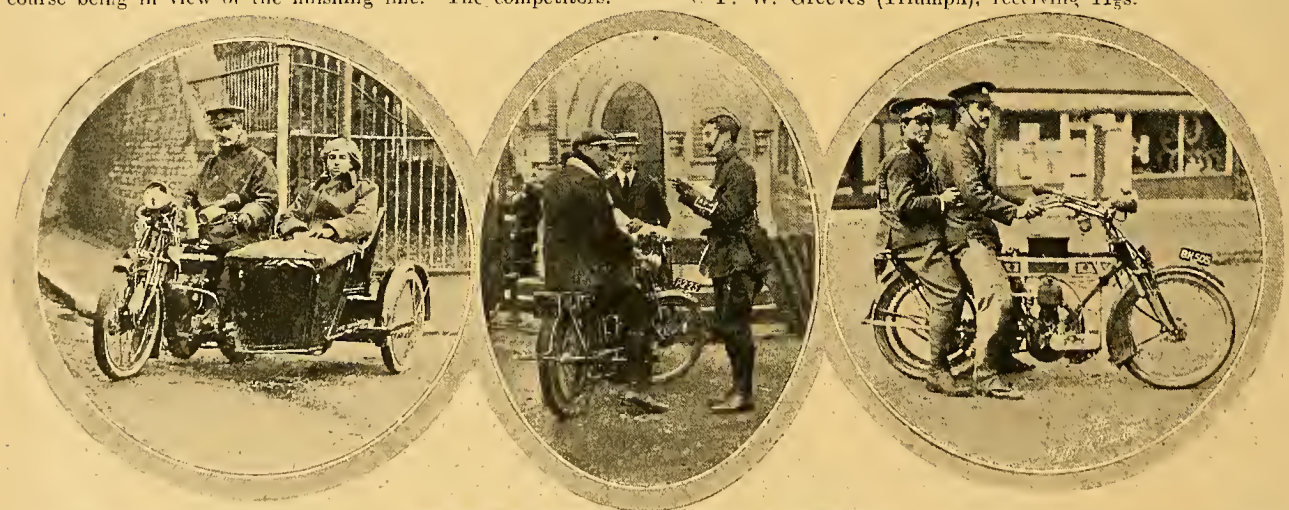
(1) The brothers F. G. and Cyril Smith, both riding 2¼ h.p. Douglas machines, on the starting line. The latter won.

(2) David Bolton, who accomplished fastest time on his 3½ h.p. Rudge, about to follow A. F. W. Greeves (Triumph).

Oakamoor, North Staffs, was again the scene of a motor cycle hill-climb on Saturday last. This event was the fourth annual inter-club contest for the silver challenge cup presented by Mr. F. A. Bolton, president of the Derbyshire and North Staffs Club, who organised the contest, which was confined to their members and those of the Mid-Staffs A.C., the Derby and District M.C.C., and the North Staffs M.C.C.

Star Bank, on the Weaver Hills, above Oakamoor, is a splendid incline if one could use its entire length, but the 1,460 yards of it which comprised Saturday's course is hardly a sufficient test for present day motor cycles. Commencing with a stiff climb, which continues to the first corner, the hill for a little distance runs almost level, entering upon a further incline at the second bend to the finish, the gradient not being more than 1 in 11. From a spectator's point of view, however, it could hardly be improved, three parts of the course being in view of the finishing line. The competitors, handicapped according to their theoretical time, were despatched up the hill in pairs. The basis used to ascertain theoretical time was not disclosed beforehand, but it certainly provided some peculiar results. The cycle event attracted some thirty entries, but on the whole the contest was more of a sporting event than a very serious test. Results:

SEMI-FINAL ROUND.



1. Cyril Smith (Douglas), receiving 44⅘s.
2. A. F. W. Greeves (Triumph).

1. A. Ainsworth (Rudge), receiving 2⅗s.
2. P. H. Openshaw (Triumph).

FINAL.

1. Cyril Smith (Douglas), receiving 40s.
2. A. Ainsworth (Rudge).

Fastest time.—D. C. Bolton (Rudge), 62⅗s., but lost to F. W. Greeves (Triumph), receiving 11⅘s.

THE SECOND MOBILISATION TEST AT MAIDENHEAD.

(1) Sergeant Tanfield (Rex-Jap and sidecar), who came from Hull, and who was the longest distance man. He started at 1 a.m. (2) Captain Trapmann examining the cards of the riders. (3) Private Birdseye (3½ h.p. Bradbury) with Private Elias, who rode the whole way from Lowestoft on the carrier. They started at 6.11 a.m.

SELECTED COMPETITIONS TO RECEIVE MANUFACTURERS' SUPPORT.

The Cycle and Motor Cycle Manufacturers' and Traders' Union has issued a circular to the leading motor cycle clubs to the effect that, for obvious reasons, the motor cycle section of the Union has decided that the number of open events promoted by clubs all over the country are so numerous as to make it impossible for them to support all. They have therefore decided to limit their entries and support in the matter of prizes to ten events, amongst which ten are included the following competitions: A.C.U. Six Days Trials and Autumn One Day Trial, M.C.C. London-Exeter run, Coventry and Warwickshire M.C. open event, Scottish Six Days Trials, Birmingham M.C.C. reliability trial, Bradford M.C.C. reliability trial, Bristol M.C.C. reliability trial, and the Irish End-to-end run organised by the Motor Cycle Union of Ireland (Ulster Centre). Not only will the members of the Manufacturers' Union support the above in the matter of entries—and it may be here observed that the Union includes the big majority of the firms engaged in the motor cycle trade—but it will support the contests by contributions out of its collective funds to the prize lists.

SIX DAYS' TRIALS ROUTES.

1,000 MILES THROUGH DEVON AND SOMERSET.

THE knowledge that this year's six days' trials are to embrace the notorious hills and inimitable scenery of Somerset and Devon has already aroused exceptional interest and enthusiasm. The arrangements for the trials are well in hand, and the course has been practically mapped out.

An exceptional amount of careful and skilful corner work will be required, as this hilly district abounds in a multiplicity of hairpin and horseshoe turnings.

We understand that the following daily routes have been mapped out, though minor alterations may probably be made at a later date:

First Day, Monday, August 12th, 177 Miles.

On the first day of the trial competitors will have a delightful run through some of the finest scenery in South Devon.

Leaving Taunton, Blagdon is the first point of interest to be reached, where a steep hill with a hairpin bend has to be negotiated.

Avoiding Exeter, the men will proceed through Dawlish and Teignmouth to Shaldon, where another bad hill will have to be tackled.

Passing on through Torquay, Paignton, Totnes, and Plymouth, Tavistock is reached. From here a steep hill leads to Two Bridges and Moreton-Hampstead, then another bad hill up to Dunsford, and the ancient city of Exeter looms in sight.

This ran from Plymouth to Exeter is very hilly throughout, running as it does right over Dartmoor. A straight run home follows through Wellington.

Second Day, Tuesday, August 13th, 166 Miles.

This is a very stiff ride, and includes Minehead, Porlock, Lynmouth, Lynton, and then across to Taunton.

It was originally intended to return to Taunton across Exmoor *viâ* Simonsbath, but the organisers think that the road over the moors is too rough, and an alternative route will be selected, probably passing through Ilfracombe.

During this day's run the famous Porlock and Lynton hills will be ascended, and Beggar's Roost Hill may also be included.

Third Day, Wednesday, August 14th, 158½ Miles.

Taunton, Barnstaple, Ilfracombe, Parracombe, Lynmouth, Porlock, and Taunton.

The above route includes Parracombe and Countisbury Hill out of Lynmouth.

Fourth Day, Thursday, August 15th, Distance Unknown.

This day's journey will consist of morning and afternoon trips from Taunton, returning to Taunton for lunch.

The route will not be disclosed before the day, but will be very carefully arrowed, and competitors will ride by the arrows only.

These two runs will include some of the local tit-bits in the form of severe surprise climbs. The minimum time in which the two sections must be ridden will be based on an average speed of 15 m.p.h.

Fifth Day, Friday, August 16th, 187¾ Miles.

Taunton, Cothelstone, Bridgwater, Axbridge, Cheddar Gorge, Dundery, Bristol, Gloucester, Birdlip, Cirencester, Bath, Wells, and Taunton.

In addition to Birdlip there is a stiff hill at Cothelstone, which is used for local hill-climbs, and this will probably be one of the timed hills.

The long climb up Cheddar Gorge will need care on account of the S turnings.

Sixth Day, Saturday, August 17th, 188½ or 151¾ Miles.

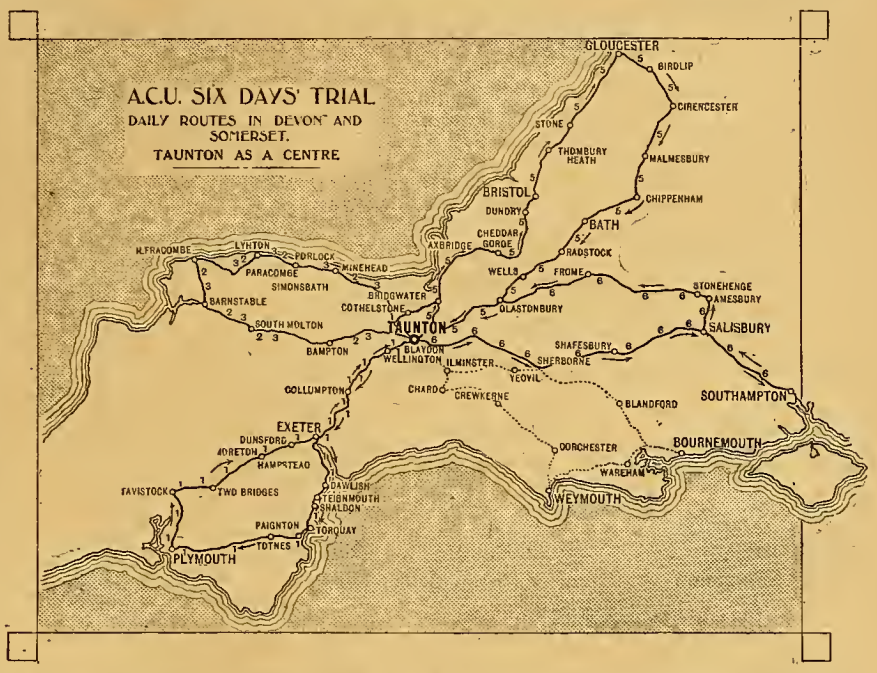
This day's run is not yet decided. It may be as below, or it may be the alternative route—No. 7.

Taunton, Shaftesbury, Salisbury, Southampton, Amesbury, Stonehenge, Frome, Glastonbury, and Taunton.

This is a fairly easy run, as there are no severe hills.

Alternative Route (shown dotted), 151¾ Miles.

Taunton, Chard, Crewkerne, Dorchester, Weymouth, Wareham, Bournemouth, Blandford, Sherborne, Yeovil, Ilminster, and Taunton This is also a fairly easy day's run.



The following are a few notes regarding this year's trials.

In running to schedule time competitors may be ten minutes early or late, but one minute in excess of ten minutes either way they lose ten marks, and after that one mark per minute. Five marks will be deducted for every tyre changed.

Competitors who feel so disposed may make use of the lunch interval for adjustments by curtailing the time taken for the meal.

The arrangements for accommodation at the local hotels have been rather difficult, but are now practically completed.

Competitors will have to line up at 7.30 each morning, and a quarter of an hour only will be allowed for adjustments, viz., from 7.45 to 8 a.m. At 8 a.m. the men will be started.

STREATHAM M.C.C. TRIAL FOR THE ORDE CUP.

In heavy rain, eleven members started in the above trial last Saturday, the route being through Riverhead, Maidstone, Canterbury, Sarre, Canterbury, Charing (lunch), Maidstone, Riverhead, Crystal Palace, and thence down to the Crown and Sceptre Hotel, Streatham Hill, the starting and finishing point.

Results (subject to confirmation by the committee).—Orde Cup: W. Pratt (3½ P. and M.), non-stop. Gold medal: Rex G. Mundy (3½ T.T. Singer), one stop (sooted plug). Silver medal: H. B. Willoughby (3½ Rudge), one stop (sooted plug). Bronze medals: S. T. Tessier (8 Bat and sc.), one stop; W. L. Barrett (8 Bat and sc.), non-stop; C. J. Feeny (3½ Triumph), one stop (belt fastener); J. Bateson (3½ L.M.C.), one stop (puncture); W. R. Sweeting (6 Bat and sc.), non-stop; A. G. Daw (3½ T.T. Triumph), one stop (sooted plug); and W. O. Oldman (8 Bat and sc.), one stop (puncture).

Anglo-Scottish Inter-team Hill-climb.

ENGLISHMEN'S NARROW WIN.

THIS event took place at Lanton Hill on Saturday. The hill is about three-fourths of a mile long, and although there are two bends they are so gradual as to be negligible. The gradient is not very steep, being about 1 in 8 to 10 on an average; it is, however, a long climb of steady gradient. The two teams were well matched, as the total differences of 7⅕s. will show. In the singles Barnes and Lindsay tied for fastest time, but the A.C.U. had a gain of 13s. in this class, which lead the Edinburgh club reduced to 7⅕s. by winning the twin and sidecar classes. Among the twins, Jamieson on an 8 h.p. Jamieson-Jap, and Reed on an 8 h.p. Dot were the fastest. Barnes had his revenge, however, in the sidecar team climb, and made fastest time quite easily. The Edinburgh team performed most consistently, although their twins were not so fast as the A.C.U. twins. The inter-team event was followed by an open hill-climb.

AUTO CYCLE UNION TEAM.

Single-cylinders.

Rider and machine.	Bore and stroke.	Time.	Figure of merit.
F. W. Barnes (3½ Zenith)	90×77½	53.2	4083
W. F. Newsome (3½ Triumph)	85×88	55.8	3256

Totals	664.8	672.	32479	31792

A. J. C. Lindsay, Scotland (Matchless), full speed at one of the bends.

A. H. Alexander, Scotland (Indian sidecar), starting in the passenger class.

RESULTS OF THE OPEN HILL-CLIMB.

An open event followed the team hill-climb, the results of which are appended:

CLASS I.—Engines under 500 c.c.

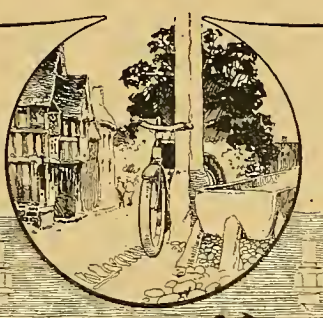
	Time.	Fig. of merit.
1. A. J. C. Lindsay (2¾ New Hudson)	77.4	4,285
2. P. Weatherilt (3½ Zenith)	54.0	3,824
3. W. F. Newsome (3½ Triumph)	53.8	3,414

CLASS II.—Engines over 500 c.c.

1. A. J. C. Lindsay (5-6 Matchless)	51.8	3,045
2. H. Reed (8 Dot)	44.2	2,808
3. C. W. Jamieson (8 Jamieson)	44.8	2,709

CLASS III.—Unlimited scratch.

1. C. W. Jamieson (8 Jamieson)	42.2
2. H. Reed (8 Dot)	43.0
3. J. R. Alexander (7 Indian)	49.0



ARTHUR MOORHOUSE MEMORIAL FUND.

Per Mrs. Jefferson and Miss Berend—			
Derby and District M.C.C., Cards 206 and 207	2	17	0

The total amount to date is £260 11s. 5d.

M.C.C. TEAM TRIAL.

ANOTHER RECORD ENTRY FOR "THE MOTOR CYCLE" CUP CONTEST.

ON Saturday next, the 15th inst., the ninth inter-club team trial for *The Motor Cycle* 50 guinea challenge cup is to be held, starting from Daventry, Northants, at 1 p.m. prompt. Again there is a record entry for this popular competition, which carries with it the motor cycle club championship. Headquarters are at the Wheatsheaf Hotel, and competitors must report themselves at noon. There are twenty-six teams, and the chosen riders, with their starting times, are given hereunder:

DERBY AND DISTRICT M.C.C. (holders).

Starting Time. H. M. S.	No.	Rider and Machine.
1 0 0 ..	1.	A. Ainsworth (3½ Rudge)
1 0 20 ..	2.	A. B. Bennett (6 Brough)
1 0 40 ..	3.	H. Baker (3½ Triumph)
1 1 0 ..	4.	E. Rossell (3½ Bradbury)
1 1 20 ..	5.	E. V. Clarke (3½ Bradbury)
1 1 40 ..	6.	H. S. Sewell (8 Campion-Jap sc.)

Reserves: W. H. Orme (3½ Rudge) and H. Lee (3½ Rudge)

BEDFORD AND DISTRICT M.C.C.

1 2 0 ..	11.	S. Crawley (3½ Triumph)
1 2 20 ..	12.	E. Murkett (3½ B.S.A.)
1 2 40 ..	13.	S. Savage (3½ Triumph)
1 3 0 ..	14.	H. J. Woods (3½ Triumph)
1 3 20 ..	15.	F. Waring (2¾ Enfield)
1 3 40 ..	16.	L. Kell (4 New Hudson sc.)

Reserves: G. Crawley (3½ Triumph) and A. Lister (3½ Triumph sc.)

BIRMINGHAM M.C.C.

1 4 0 ..	21.	R. W. Duke (3½ Zenith-Gradua)
1 4 20 ..	22.	A. D. Arter (3½ James)
1 4 40 ..	23.	R. V. C. Brook (3 water-cooled Precision)
1 5 0 ..	24.	H. J. Cox (2¾ Forward)
1 5 20 ..	25.	W. H. Eggleton (3½ New Hudson)
1 5 40 ..	26.	Dr. B. Fawssett (8 Chater-Lea-Jap sc.)

Reserves: H. Newey (3½ Ariel) and F. Southam (6 Zenith sc.)

BRISTOL B. AND M.C.

1 6 0 ..	31.	W. W. Moore (Humber)
1 6 20 ..	32.	H. R. Bishop (A.J.S.)
1 6 40 ..	33.	A. F. Margoschis (Ivy-Precision)
1 7 0 ..	34.	S. J. Fair (B.S.A. or A.J.S.)
1 7 20 ..	35.	L. E. Scammell (Rex or B.S.A.)
1 7 40 ..	36.	F. Bevan (Rex sc.)

Reserves: A. J. Whitcombe (Willway), E. J. Prosser (Rex Sidette), and A. B. Danks (A.J.S. sc.)

BRISTOL M.C.C.

1 8 0 ..	41.	F. C. Wasley (2¾ Douglas)
1 8 20 ..	42.	P. Phillips (2¾ Douglas)
1 8 40 ..	43.	E. Kickham (2¾ Douglas)
1 9 0 ..	44.	Eli Clark (2¾ Douglas)
1 9 20 ..	45.	F. P. Davies (3½ Rudge)
1 9 40 ..	46.	W. W. Douglas (8 Williamson sc.)

Reserves: J. B. Kellar (3½ B.S.A.) and P. Grout (4½ Quadrant).

COVENTRY AND WARWICKSHIRE M.C.

1 10 0	51.	A. Elson (3½ Singer)
1 10 20	52.	W. F. Newsome (3½ Triumph)
1 10 40	53.	A. N. Barrett (3½ Rudge)
1 11 0 ..	54.	S. Wright (3½ Humber)
1 11 20 ..	55.	G. Smith (3½ Rover)
1 11 40	56.	H. Williamson (8 Williamson sc.)

Reserves: D. Elson (3½ Triumph) and E. A. Gorton (6 Rex Sidette).

ESSEX M.C.C.

1 12 0 ..	61.	G. T. Gray (3½ Rudge)
1 12 20 ..	62.	W. Cooper (3½ Bradbury)
1 12 40 ..	63.	H. C. Hemy (3½ Service)
1 13 0 ..	64.	J. A. Campbell (3½ Rudge)
1 13 20 ..	65.	A. P. Howard (2½ Singer)
1 13 40 ..	66.	A. Hill (7 Indian sc.)

Reserves: D. S. Parsons (6 Rex Sidette) and K. S. Kapadia (6 Rex-Jap sc.)

HERTS COUNTY AUTO AND AERO CLUB.

Starting Time. H. M. S.	No.	Rider and Machine.
1 14 0 ..	71.	E. A. Colliver (3½ Zenith)
1 14 20 ..	72.	E. Jarvis (3½ Triumph)
1 14 40 ..	73.	N. Gutteridge (3½ Triumph)
1 15 0 ..	74.	Maurice Down (7 Indian)
1 15 20 ..	75.	— Nott (3½ Ivy-Precision)
1 15 40 ..	76.	B. T. Rice Pyle (8 Bat sc.)

Reserves: A. H. Colliver (3½ Zenith) and E. S. Lee (3½ Rudge).

LEICESTER AND DISTRICT M.C.C.

1 16 0 ..	81.	A. L. Barker (3½ Singer)
1 16 20 ..	82.	E. Folwell (3½ B.S.A.)
1 16 40 ..	83.	E. Nedham (3½ Campion-Jap)
1 17 0 ..	84.	— Yates (3½ Rudge)
1 17 20 ..	85.	Mrs. Simpson (3½ Rudge)
1 17 40 ..	86.	F. S. Bowley (7 Indian sc.)

Reserves: R. Waiawright (3½ Campion-Jap) and Bowerman (3 Ebo).

LIVERPOOL A.C.C.

1 18 0 ..	91.	N. Brown (7 Indian)
1 18 20 ..	92.	W. Heaton (A.J.S.)
1 18 40 ..	93.	C. Hobbs (Humber)
1 19 0 ..	94.	J. H. Fox (3½ Rudge)
1 19 20 ..	95.	S. W. Phillpott (Humber)
1 19 40 ..	96.	P. P. Syvret (Rex sc.)

Reserves: C. L. Scott (3½ Rudge) and M. Rimmer (3½ Zenith).

LUTON AND SOUTH BEDS. M.C.C.

1 20 0 ..	101.	S. W. Brown (3½ Bradbury)
1 20 20 ..	102.	G. Boae (3½ Triumph)
1 20 40 ..	103.	C. Dickenson (3½ Rudge)
1 21 0 ..	104.	R. P. Terry (3½ New Hudson)
1 21 20 ..	105.	F. R. Child (3½ New Hudson)
1 21 40 ..	106.	F. Mussell (5 Rex sc.)

Reserves: E. S. Godfrey (3½ New Hudson) and R. C. Deacon (3½ Rudge).

MOTOR CYCLING CLUB.

1 22 0 ..	111.	W. Pratt (3½ P. and M.)
1 22 20 ..	112.	H. Karslake (3½ Rover)
1 22 40 ..	113.	E. Pond (3½ Rudge)
1 23 0 ..	114.	R. M. Brice (3½ Brown)
1 23 20 ..	115.	P. Moffatt (2¾ Douglas)
1 23 40 ..	116.	W. Chater-Lea (7 Chater-Lea sc.)

Reserves: P. H. Beotley (3½ Triumph) and L. A. Baddeley (6 Baddeley).

MERSEY M.C.

1 24 0 ..	121.	F. Rees (3½ Rudge)
1 24 20 ..	122.	T. Moore (3½ Triumph)
1 24 40 ..	123.	F. C. Jones (3½ Bradbury)
1 25 0 ..	124.	T. Heaton (2½ Singer)
1 25 20 ..	125.	C. W. Samuels (3½ Ariel)
1 25 40 ..	126.	W. E. Smith (6 Zenith sc.)

Reserves: A. Shaw (3½ Rudge) and A. A. Jaffa (8 Zenith sc.)

NORFOLK M.C.C.

1 26 0 ..	131.	A. Adcock (5-6 F.N.)
1 26 20 ..	132.	S. G. Allen (3½ Triumph)
1 26 40 ..	133.	R. G. Attwood (5-6 F.N.)
1 27 0 ..	134.	G. Boswell (3½ Ariel)
1 27 20 ..	135.	C. Duberly (3½ Ariel)
1 27 40 ..	136.	J. Boddy (8 Bat sc.)

Reserves: R. Walker (4 Scott sc.), Dr. V. H. Blake (2¾ Anglican), and E. M. Wood (3 N.S.U.)

NORTHAMPTONSHIRE M.C.C.

1 28 0 ..	141.	A. E. Catt (3½ Triumph)
1 28 20 ..	142.	W. Barratt (3½ Rudge)
1 28 40 ..	143.	W. Lees (3½ Triumph)
1 29 0 ..	144.	H. H. Saddington (3½ James)
1 29 20 ..	145.	C. H. Jolley (3½ Triumph)
2 29 40 ..	146.	D. Barratt (8 Zenith sc.)

Reserves: C. Harris (3½ Triumph) and A. Powell (8 Matchless).

NORTH-WEST LONDON M.C.C.

1 32 0 ..	161.	G. H. Hollis (2¾ Douglas)
1 32 20 ..	162.	E. Rose (3½ P. and M.)
1 32 40 ..	163.	Glyn Rowden (3½ Triumph)
1 33 0 ..	164.	H. H. Berlandina (2¾ Douglas)
1 33 20 ..	165.	W. Cooper (3½ Bradbury)
1 33 40 ..	166.	E. W. Ashworth (8 Chater-Lea sc.)

Reserves: A. J. Dreydel (5 Ivy-Precision sc.) and H. J. Pooley (3½ Premier).

NORTH MIDDLESEX M.C.C.

1 30 0 ..	151.	G. L. Fletcher (2¾ Douglas)
1 30 20 ..	152.	C. Q. Roberts (3½ Rover)

Starting Time. H. M. S.	No.	Rider and Machine.
1 30 40 ..	153.	D. H. Noble (3½ Rover)
1 31 0 ..	154.	H. C. Mills (3½ Premier)
1 31 20 ..	155.	P. Daugerfield (3½ Premier)
1 31 40 ..	156.	F. Pither (6 Enfield sc.)

Reserves: H. E. Davison (3½ Kerry-Abiogdon) and E. C. Jarvis (3½ Triumph).

NORWICH AND DISTRICT M.C.C.

1 34 0 ..	171.	H. Chapman (3½ Triumph)
1 34 20 ..	172.	A. Lincoln (3½ Triumph)
1 34 40 ..	173.	F. Brighty (3 J.A.P.)

SUTTON COLDFIELD AND MID-WARWICKSHIRE A.C.

1 46 0 ..	231.	Seymour Smith (3½ Norton)
1 46 20 ..	232.	R. Holloway (3½ Premier)
1 46 40 ..	233.	W. H. Sheldon (3½ Regal-Precision)
1 47 0 ..	234.	J. H. Slaughter (3½ L.M.C.)
1 47 20 ..	235.	T. Pollock (James sc.)
1 47 40 ..	236.	F. Whitworth (6 Enfield sc.)

Reserves: J. St John (Quadrant) and L. Newey (Levis).

WALTHAMSTOW M.C.C.

1 48 0 ..	241.	J. H. Kerr (3½ N.S.U.)
1 48 20 ..	242.	F. W. Applebee (2¾ Centaur)
1 48 40 ..	243.	A. E. Uffleman (6 Rex-Jap)
1 49 0 ..	244.	A. G. Peppercorn (3½ Bradbury)
1 49 20 ..	245.	F. A. Applebee (3½ Scott)
1 49 40 ..	246.	G. West (A.C. Sociable)

Reserve: W. Wilson.

WOLVERHAMPTON M.C.C.

1 50 0 ..	251.	T. H. Haddock (2½ A.J.S.)
1 50 20 ..	252.	Reg. Tooks (3½ Rudge)
1 50 40 ..	253.	C. Williams (3½ Zenith)
1 51 0 ..	254.	J. H. Wedge (3½ Rudge)
1 51 20 ..	255.	J. T. Ireland (3½ Ireland)
1 51 40 ..	256.	A. J. Stevens (5 A.J.S. sc.)

Reserves: C. Boyes (2½ A.J.S.) and G. Hill (3½ Rudge).

CURRENT CHAT

TIME TO LIGHT LAMPS.

June 13th	... ...	9.15 p.m.
,, 15th	... ...	9.16 ,,
,, 17th	... ...	9.17 ,,
,, 19th	... ...	9.18 ,,

Practising for the T.T.

Practising over the course in the Isle of Man commences on Wednesday next, the 19th inst., from 5 to 7 a.m. The last day for practising is Thursday, June 27th, the day before the Junior T.T. race.

Latest T.T. Entries.

Late entries for the Senior T.T. race include W. L. T. Rhys and Percy Butler on Triumphs. In the Junior event, M. Stoessel will ride an Alcyon entered by Gentil et Cié., and P. W. Owen has entered a Forward.

English-Dutch Trial.

Further news in connection with the Dutch international trial will appear next week. Two of the chosen reserves find it impossible to accompany the teams for various reasons, and as it is desirable that there are two reserves in each class, the entrants with the highest number of votes outside the teams will be chosen.

Noted Hills in the Six Days' Trials.

Among the hills which will be included in the A.C.U. Six Days' Trial, which will be held from August 12th to 17th inclusive, are the following: Birdlip, Beggar's Roost, Blagdon, Cheddar Gorge, a hill near Dunsford (Exeter), Lynton, Countisbury, Moreton Hampstead, Porlock, Shaldon, and Two Bridges. The positions of most are well known. The hill at Blagdon is near Taunton, and the one at Shaldon is between Torquay and Teignmouth.

Italian Grand Prix.

On the 16th inst. the Societá Sportiva la Torino, 3, Via Cuneo, Turin, will hold a motor cycle race called the Grand Prix de Turin over a sixty-two miles course, embracing Orbassano, Bruino, and Piossasco.

The First Sidecar up Dinas Mawddwy.

In response to the query in our last issue, "Who will be the first sidecarist to take a passenger up Bwlch-y-Groes?" H. A. Collier advises us that he will make an attempt with his Matchless sidecar after the T.T. races. Perhaps, meanwhile, other sidecarists may be tempted to try their luck. At any rate, the Coventry and Warwickshire Motor Club can take credit for having focussed attention on this Welsh terror, which is almost as bad as Honister Pass.

SPECIAL FEATURES.

THE SIX DAYS' TRIALS COURSE.
NEW MODELS.
THE MOBILISATION TEST.
THE PROBLEM OF THE AUTOMATIC CARBURETTER.

Original.

A 2¾ h.p. Douglas will be represented in the Senior T.T. Race, the Colmore Depot, Birmingham, having decided to enter S. L. Bailey, the Australian, for both events.

This Issue.

Photographs of the Anglo-Scottish hill-climb, also the second mobilisation test, appear exclusively in *The Motor Cycle* to-day. Besides other special features the first details and map of the Six Days' Trials course are included, also a description of a new model—the Eclipse. *The Motor Cycle* is the only journal to give a complete record of doings in the motor cycling world, several pages being regularly devoted to important club competitions throughout the country.

Zenith Cup.

On Saturday next, at the Brooklands Automobile Racing Club meeting, a race for Zenith solo and sidecar machines is included. Zenith Motors, Ltd., have offered a silver cup to the winner of this event, which we illustrate. The seventeen entrants are given on page 659.

Competitors in the Streatham and District M.C. competition for the Julian Orde Cup to Canterbury and back on Saturday last. In the foreground may be seen W. O. Oldman (Bat-Jap-Canoelet), who was the holder of the cup (see page 653.)

A Sign of the Times.

The Sewage Committee of the Bradford City Council have decided to purchase a motor-cycle for the use of the resident engineer (Mr. Wontner-Smith) at the Esholt Sewage Works, at an estimated cost of £75.

Motor Cyclists for the Manœuvres.

The A.C.U. has been invited by the War Office to forward the names of motor cyclists anxious to take part in the manœuvres, and also for the cavalry divisional training previous to manœuvres. Applicants should apply to the secretary, 89 Pall Mall, S.W.

The High Price of Petrol.

At the recent meeting at the R.A.C., called to discuss the high price of petrol at present prevailing, it was decided, on the proposition of Mr. S. F. Edge, to form a committee of the R.A.C. and the A.A. and M.U. and other important motoring bodies to decide the best method to adopt. The A.C.U. has been invited to send two delegates.

Imports and Exports of Motor Cycles.

The imports and exports of motor cycles for the month and five months ended May 31st for the last three years are given in the following tables:

IMPORTS.

	Month ended May 31st. 1910.	1911.	1912.
Motor cycles—	£4,916	£3,935	£3,224
Parts thereof—	£3,581	£7,228	£9,486
Total	£8,497	£11,163	£12,710

	Five months ended May 31st. 1910.	1911.	1912.
Motor cycles—	£20,585	£22,555	£21,025
Parts thereof—	£23,729	£29,269	£42,406
Total	£44,314	£51,824	£63,431

BRITISH EXPORTS.

	Month ended May 31st. 1910.	1911.	1912.
Motor cycles—	£7,138	£17,520	£35,957
Parts thereof—	£2,357	£5,186	£16,500
Total	£9,495	£22,706	£52,457

	Five months ended May 31st. 1910.	1911.	1912.
Motor cycles—	£36,160	£82,470	£172,196
Parts thereof—	£15,437	£26,662	£64,309
Total	£51,597	£109,132	£236,505

It will be seen the British exports still maintain their steady increase, as the total value of exports for the month of May this year is over double the value of the same month last year and over five times the amount of the previous year, while for the five months ended May 31st, 1911, the value of the exports was £236,505. This, as will be seen, is over twice the amount for the corresponding period in 1911, and over four times the amount for 1910

FUTURE EVENTS

June 4 and 15.—Dublin M.C.C. Open 24 Hours' Reliability Trial.
„ 15.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CHALLENGE CUP.
„ 28.—JUNIOR TOURIST TROPHY RACE.
July 1.—SENIOR TOURIST TROPHY RACE.
„ 6.—Dublin M.C.C. Open Hill-climb
„ 15.—Irish Open End-to-end Reliability Trial.
„ 20.—B.M.C.R.C. Race Meeting.

Disembarkment of Machines at Douglas.

The Douglas Corporation has arranged a fixed scale of charges for the porters unloading or loading motor cycles on the quays. The charges are 6d. per porter for each machine, or if the porter is assisting the owner of the machine, 9d. Formerly these men charged exorbitant prices for their services.

Another Case Dismissed

L. N. Palmer, of Tooting, was, on the 3rd inst., summoned for exceeding the 10 m.p.h. speed limit in Leatherhead. Defendant stated that he stopped at the corner just before the trap, and the road being slightly uphill it was impossible for his cyclecar to have attained the alleged speed in the time, as the design of the transmission made it impossible for him to pick up speed quickly. The Bench dismissed the case.

A Practical Joke which was not Relished.

The Boy Scouts have now been declared winners of the manœuvres in connection with the Coventry and Warwickshire Motor Club, as it has been proved that three of the six motor cyclists who entered Rugby got through the Scouts' ranks in a pantechnicon. The "discovery" has caused great amusement among motorists, not so the Boy Scouts, who, according to a daily paper, "are slapping their knees and waving their 650 poles in anger."

Side Lamps for Sidecars.

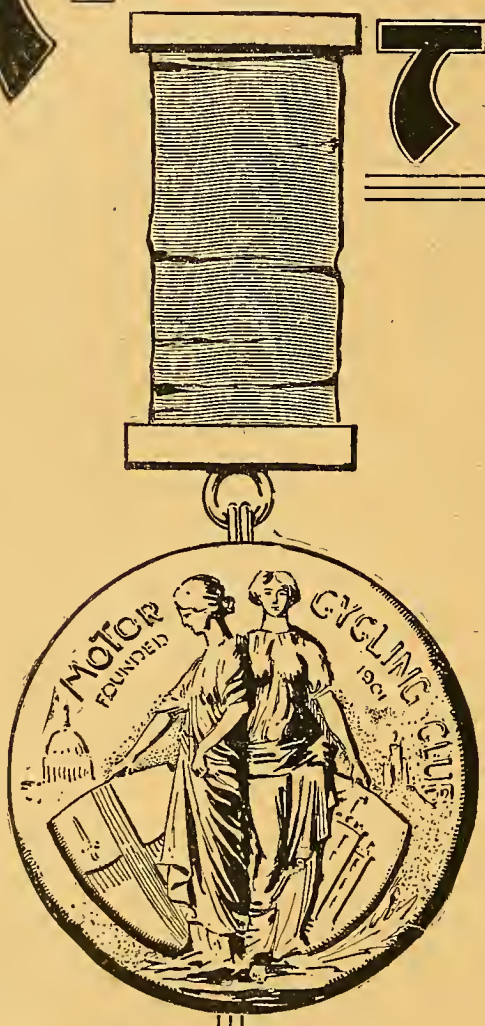
The Scottish Automobile Club has pointed out to the R.A.C. and the A.C.U. the danger existing through many sidecarists not using side lamps to show the full width of their vehicle. It will be remembered that this important matter formed the subject of a leading article in *The Motor Cycle* recently, and it is to be hoped that the recommendation will not be disregarded.

The T.T. Entrants.

A meeting of the A.C.U. Competitions Committee was held on Wednesday last week, at which all the entries for the Tourist Trophy Race, published last week were accepted except that of Alan E. Woodman, the one-legged motor cyclist. The A.C.U. barred Woodman, as the committee considered that his deformity might render him a danger to the other competitors. Woodman is sorely disappointed at the decision.

Touring in Devon.

Numerous complaints have been made to the police in Lynmouth as to the conduct of motor cyclists in rushing across the cross roads opposite the Lyndale Hotel over and over again in trying Countisbury and Lynton Hills. The matter has been considered by the Town Council, and, as a *preliminary step*, the police have been asked to deal with it if possible without going to extremes. They do not want to issue summonses if it can possibly be avoided.



A Fine Climb.

Harry Bashall writes us an account of a new hill which, from all accounts, is a terror. It is known as Succombes Hill, and is situated almost opposite Cyril Patterson's new garage near Caterham. The surface resembles a river bed, and there is a bad hairpin bend to the left, with a reputed gradient of 1 in 3. At the very first attempt Harry Bashall took his 2¾ h.p. T.T. Douglas up the hill, and, having so much in hand, he lowered his gear to 10 to 1 and took up Victor Wilberforce on his carrier. The combined weight of rider and passenger totals 24 stones.

ANGLO-SCOTTISH HILL-CLIMB. H. Berwick (3½ h.p. New Hudson sidecar) negotiating the first corner at Lanton Hill. It will be noticed that some of the spectators are standing on the inside of the corner, which must have hindered the competitors considerably.

HUTCHINSON TYRES

¶ The great point about Hutchinson success is that it keeps on.

Not an occasional triumph, and then —an ominous silence, but success on success, each fresh victory greater than the previous one.

Here is the story of our latest coup:

London-Edinburgh-London

M.C.C. Reliability Trial.

In this event 38 riders started fitted with Hutchinson Tyres, and of these 8 received Gold Medals for the single journey, and 30 Special Gold Medals for the double journey.

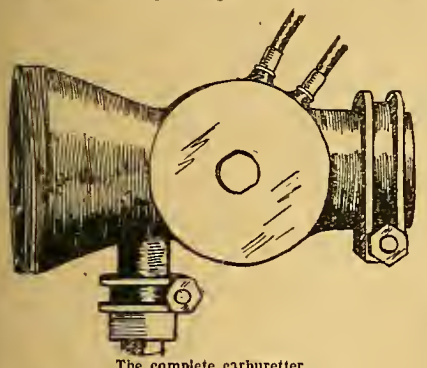
38

Hutchinson riders = 30 Special Gold Medals. 8 Gold Medals.

Total - - 38 Gold Medals.

IMPORTANT.—Let us remind you that all Hutchinson Tyres used in the above, or in any other competition on road or track, are identical in every respect to those we supply to the public. We never have made special tyres for competition work, and that is one reason why our tyres are "distinct from all others."

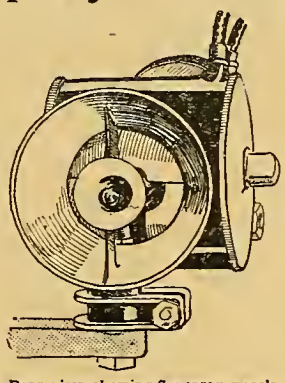
Allow us to send you our latest novelty—"WHY?"



HUTCHINSON TYRE CO., 70, BASINGHALL STREET, LONDON. E.C.

B24

In answering this advertisement it is desirable to mention "The Motor Cycle."

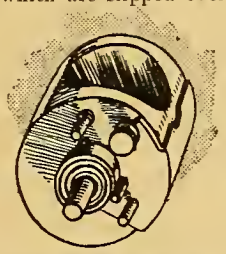


A New Senspray Racing Carburetter.

A NEW Senspray carburetter has been designed for next season, and though it will not be placed on the market till then we have been privileged to see one

The complete carburetter.

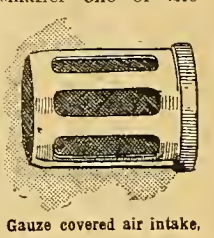
of the first to be manufactured. As might be expected, the Senspray principle, which has been so successful during the present season, has been maintained, though its adaptation has been improved. The float chamber is on the usual lines, though on the new type a screw top is fitted, and a neater and stronger form of float needle clip adopted, which cannot be damaged by rough usage. The body of the carburetter consists of a horizontal tubular member, in which is carried a duplex barrel throttle supported in large bearings, and suitably cut away to allow a free passage of vapour to the jet at small throttle open-



Rear view showing Senspray nozzle.

ings. The air valve consists of a saddle piece working on the outsied of the throttle, and both valves are shut by a simple but ingenious adaptation of the drum spring. The control wires are fitted with eyelets which are slipped over pegs protruding from the air and throttle valves respectively.

New clip for float needle



The throttle barrel, also showing air saddle.

So simple is the mechanism, that, by merely detaching one cover of the throttle barrel the whole of the moving parts can be taken out for inspection, and this without the possibility of their being put back wrongly.

The bell mouth through which the air enters is so finished that a dust cap or long tube may be fitted at the option of the rider (we illustrate herewith a neat form of dust cap which can be supplied with the carburetter), and it will be a simple matter to apply crank-case pressure to the vaporising tube.

The usual Senspray induction pipe clip is retained, and a smaller one of the same type holds the float chamber to the carburetter body. The handle-bar control has been slightly modified, the clip being arranged so that it will suit any type of bar and can be made to open either inwards or outwards. Also the cable adjustments can now be done at the handle-bar end with the aid of a small screwdriver.

Gauze covered air intake.

In practice the carburetter is controlled almost entirely by the throttle lever, though the air lever comes in useful for starting and for steep hills.

The workmanship is excellent, and we are looking forward to hearing of splendid results on the road.

Next Saturday's Meeting at Brooklands.

Entries in the motor cycle races for the June meeting of the B.A.R.C., to be held next Saturday, the 15th inst., are given below :

2.25 p.m. The Ninth Short Race (a handicap) :

	Bore and stroke.
E. Kickham (2-cyl. Douglas)	61 × 60
A. J. Luce (2-cyl. Bat)	85 × 65
W. Dewar (1-cyl. Triumph)	85 × 88
W. D. South (1-cyl. Rudge)	85 × 88
W. Stanhope-Spencer (1-cyl. Rudge)	85 × 88
W. H. Elce (1-cyl. Rudge)	85 × 88
Vernon Taylor (1-cyl. Rudge)	85 × 88
Stanley Timson (1-cyl. Rudge)	85 × 88
F. G. Edmond (1-cyl. Humber)	60 × 70
N. D. Slatter (1-cyl. Alcyon)	62 × 82
J. A. Manners-Smith (1-cyl. Triumph)	85 × 88
H. Martin (1-cyl. Martin)	76 × 59
A. G. Walker (1-cyl. Rudge)	85 × 88
J. H. Whitlark (2-cyl. Rex)	77½ × 95
G. E. Stanley (1-cyl. Singer)	69 × 60
J. Cocker (1-cyl. Singer)	69 × 80
J. Pippet (1-cyl. Singer)	69 × 80
F. G. Flanders (1-cyl. Rudge)	85 × 88
G. B. S. McBain (1-cyl. J.A.P.)	85 × 60

3.30 p.m. The Eighth Long Race (a handicap) :

	Bore and stroke.
E. Kickham (2-cyl. Douglas)	61 × 60
A. J. Luce (2-cyl. Bat)	85 × 65
W. Dewar (1-cyl. Triumph)	85 × 88
W. D. South (1-cyl. Rudge)	85 × 88
W. Stanhope-Spencer (1-cyl. Rudge)	85 × 88
W. H. Elce (1-cyl. Rudge)	85 × 88
Vernon Taylor (1-cyl. Rudge)	85 × 88
Stanley Timson (1-cyl. Rudge)	85 × 88
F. G. Edmond (1-cyl. Humber)	60 × 70
N. D. Slatter (1-cyl. Alcyon)	62 × 82
J. A. Manners-Smith (1-cyl. Triumph)	85 × 88
H. Martin (1-cyl. Martin)	76 × 59
W. G. Fowler (1-cyl. Rudge)	85 × 88
J. H. Whitlark (2-cyl. Rex)	77½ × 95
E. F. Remington (2-cyl. Matchless)	90 × 77½
G. E. Stanley (1-cyl. Singer)	85 × 88
J. Cocker (1-cyl. Singer)	69 × 80
F. G. Flanders (1-cyl. Rudge)	85 × 88
G. B. S. McBain (1-cyl. J.A.P.)	85 × 60

4.10 p.m. The Rudge Sprint (a handicap) :

One-cylinder Rudge, 85×88 mm. bore and stroke: Stanley Timson, Vernon Leggatt, W. D. South, W. Stanhope-Spencer, W. H. Elce, Vernon Taylor, E. F. Remington, A. G Walker, Herbert C. Vine, Arthur H. Woodington, W. Gordon-Fowler, H. W. Farmer, F. G. Picken, C. Janicker, R. T. Wood, Basil Collier, W. H. Edwards, S. Russell-Cooke, C. Patteson, E. C. Heis, M. G. Fleming, Charles Warren, and Clifford Pressland.

The Singer Sprint (a handicap) :

One-cylinder Singer, 69×80 mm. bore and stroke: N. A. Ayres, J. Cocker, R. G. Mundy, O'Donovan, Petty, Pickering, J. Pippet, Smith, G. E. Stanley, W. A. Jacobs, Harold Petty, and J. P. Le Grand.

The Zenith Motor Cycle and Sidecar Sprint (a handicap) :

	Bore and stroke.
G. F. Hunter (2-cyl.)	90 × 77½
L. P. Openshaw (2-cyl.)	85½ × 85
E. B. Ware (2-cyl.)	76 × 54½
P. Weatherilt (2-cyl.)	76 × 82
F. W. Barnes (2-cyl.)	90 × 77½

The following will drive 76×85 mm. twins: H. Jepson, R. Charlesworth, H. H. Huckle, H. Luxford, E. C. Baker, E. S. New, W. J. Marshall, F. R. Tillman, M. L. Ainslie, A. J. Luce, W. Moore, and W. G. Bower.

BROOKLANDS OBSERVATIONS.

The Singer water-cooled single-cylinder racing machine, designed by Lonis Coatalen, of the Sunbeam Co., which we described a couple of months ago, is being tested on Brooklands again, this time in the hands of A. J. Dixon.

It is not proposed to attempt records at present on it, as G. E. Stanley is confident he can capture the single-cylinder hour record on his 3½ h.p. 75½ mile an hour air-cooled machine.

The wonderful speed of the T.T. Douglas ridden by S. L. Bailey at the last B.M.C.R.C. meeting cannot have failed to attract attention; this well-known Australian rider told us last week that he was sure of his ability to improve upon Sam Wright's 350 c.c. hour record of 58 miles 1,408 yards on a 2¾ h.p. twin Humber, and may shortly make the attempt. Bailey has entered for the Junior T.T.

Sixty miles in an hour on a light-weight is undoubtedly an attractive proposition, and the time does not appear to be very far distant when this feat will be accomplished on a 2¾ h.p. twin.

Of course it is well-known that Sam Wright came within an ace of accomplishing the feat on his record ride, but owing to shortage of lubricating oil he nearly came to a standstill in one lap near the finish.

CLUB NEWS

North Middlesex M.C.C.

In view of the T.T. races, it has been decided to postpone the twelve hours' open reliability trial, which was to have taken place on the 29th inst.

Dublin and District M.C.C.

The open reliability trial will take place on the 14th and 15th inst., and take the form of a twenty-four hours test. The route will comprise Drumcondra (start), Belfast, Londonderry, Donegal, Cavan, and back to Dublin (Phœnix Park).

Lowestoft and District M.C.C.

A club has been formed in this district, the name of which

The Lewes and Tunbridge Wells M.C.C.'s joint hill-climb at Captain Kidd's Hill.

is to be as above, and the following officers have been elected: President, Dr. Hutchinson; captain, Mr. Sidney Smith; vice-captain, Mr. Beals; treasurer, Mr. V. J. Chadd; secretary *pro tem.*, Mr. W. S. Wilkins.

Brecon and Radnor M.C.C.

A club has been formed with the above title, its president elect being Capt. Glen Kidston, Gwernyfed Park. Officers and committee have also been chosen. The first run was on the 5th inst; on the 19th inst. a run will take place to Raglan. A reliability and speed trial will come off in the immediate future. Hon secretary, Mr. C. J. Nott, Brecon.

Ayr and District M.C.

A petrol consumption trial was held on the 5th inst. extending over a very hilly course of 22½ miles.

The results were based on the formula $\frac{C+W}{\text{Petrol in ozs.}}$, the winner of the single-cylinder class, George Sloan, on a 3½ h.p. Sun-Precision, used 18½ ozs. of petrol, which works out at the remarkable figure of 194.5 m.p.g.

		Petrol in ozs.	Fig. of merit.	m.p.g.
1.	Geo. Sloan (3½ Sun-Precision) ...	18½	48.3	194.5
2.	Jas. Gilchrist (3½ Triumph) ...	23½	37.5	153.1
3.	Geo. Cocker (3½ C. and R.) ...	25½	34.	141.1
	TWIN CYLINDERS.			
1.	A. Somerville (5 Rex de Luxe) ...	38	30.5	94.7
2.	Miss May Senior (2¾ 2-sp. Douglas)	26½	23.5	135.8

Hampshire M.C.U.

A speed-judging competition was held on the 5th inst. at Ower, near Romsey. Members of the Southampton, Bournemouth, Portsmouth, and Winchester clubs took part. Watches and speedometers were barred. Result: 1, Mrs. Clark, Bournemouth (3½ h.p. Zenith and sc.), 4s. slow; 2, G. E. Eyston, Bournemouth (3½ h.p. Rudge), 5s. slow; 3, P. Kiln, Portsmouth (3¼ h.p. New Hudson and sc.), 12s. fast.

Essex M.C.

On Saturday, June 1st, the above club held a members' hill-climb on Dawes Hill, Chingford. The results were as follows:

SIDECAR CLASS.

Rider and machine.	Fig. of merit.	Time.
G. T. Gray (3½ Rudge and sc.) ...	36.5 ...	45⅘s.
N. Gray (6 Zenith)	39.7 ...	39⅘s.
B. A. Hill (7 Indian) ...	45.8 ...	36⅗s.

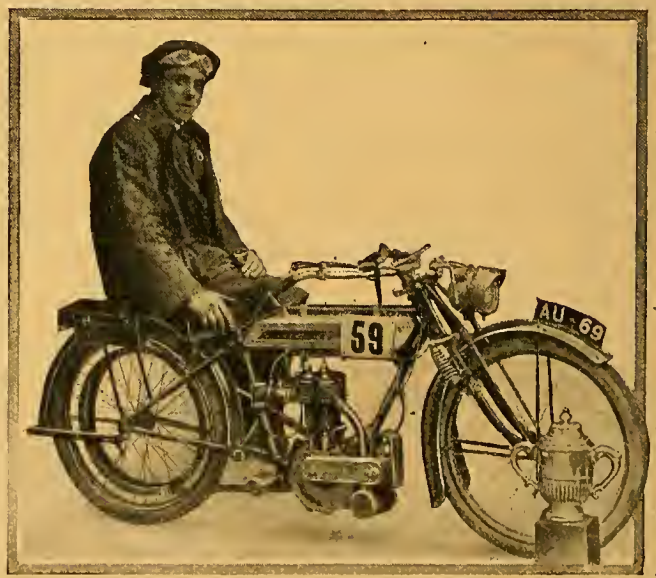
Lewis (8 h.p. J.A.P.) made fastest time in 33⅘s.

SOLO CLASS.

M. Campbell (3½ Rudge)	27.5 ...	20⅘s.
G. T. Gray (3½ Rudge)	28.6 ...	23⅘s.
B. C. De W. Siffken (2 S.I.A.M.T.)	29.1 ...	30⅕s.

The annual twenty-four hours' ride from Woodford to York and back for members only will take place on August 30th and 31st. Particulars can be obtained from Mr. H. Fuller, 51, Pulteney Road, South Woodford, Essex.

Motor Cycle Union of Ireland (Ulster Centre).



On Saturday afternoon this centre held a hill-climbing competition at Roquery Hill, situate about three miles from Toomebridge, and twenty-five miles from Belfast. The hill is very suitable, and the distance of the climb was exactly half a mile. Result of private owners' class:

	Handicap.	Net time.
1. Alan Combe (2½ Singer)	30s. ...	32s.
2. Stanley Pyper (3½ Zenith-Gradua) ...	3s. ...	35⅗s.
3. C. A. Porrett (3½ Triumph)	10s. ...	36⅘s.

Eighteen started in the open class, and although A. Combe was 1⅗s. slower his handicap allowance was sufficient to enable him to secure another win, the placings being:

1. Alan Combe (2½ Singer)	30s. ...	33⅗s.
2. J. Gordon Getty (3½ Triumph)	10s. ...	35⅘s.
3. P. H. Dods (2½ New Hudson)	30s. ...	36⅖s.

S. P. Corry (3½ h.p. Matchless) from scratch made fastest time, viz., 37⅗s. Very valuable assistance was rendered by the members of the Royal Irish Constabulary.

M.C.C. CHALLENGE CUP WINNER.

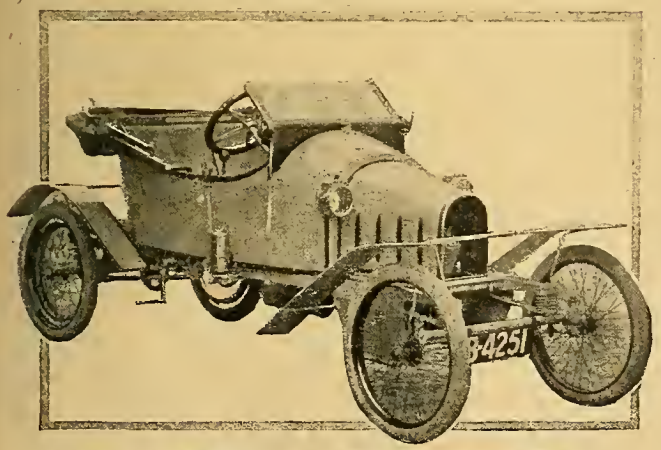
By winning the M.C.C. challenge cup in the London-Edinburgh and back competition three years in succession, George Brough, of Nottingham, now becomes the holder. To win the cup he has covered 2,377 miles, his total deviation from schedule time being 10 min. 43 secs. in 1910, 5 min. 44 secs. in 1911, and nothing this year—quite a record in itself.

Some of the successful sidecarists in the Coventry and Warwickshire M.C. Welsh run. C. T. Lloyd (6 h.p. Rex Sidette), A. Wright (3½ h.p. Triumph and sidecar), and A. Elson (4 h.p. two-speed Singer and sidecar).

Bedford and District M.C.C.

On the 19th ult. the second trial was held (a seventy-five mile non-stop run at a schedule speed of 20 m.p.h., watches and speedometers barred). Results: 1, G. Crawley (3½ Triumph), gold medal; 2, E. Murkett (3½ B.S.A.), silver medal; S. Savage (3½ Triumph and sidecar), special prize for best sidecar performance; Mrs. W. H. Kirkpatrick (Douglas), special prize for best performance by a lady.

Walthamstow M.C.



The 250 miles reliability trial to Yarmouth and back, held on June 2nd, for the W. S. Low cup, resulted as follows: 1, J. W. Percival (6 h.p. Fafnir tricar), time error at secret check 10s. slow, silver cup and gold medal; 2, F. Picken (3½ h.p. Rudge), error 59s. fast; W. Fairhead 4 h.p. Peugeot and sidecar), 1m. 14s. fast, and H. Eiden (5 h.p. F.N.), 1m. 14s. slow, tied for third place.

North Staffs M.C.C.

A reliability trial was held on the 2nd inst., wretched weather prevailing. The course selected was: Start Plough Inn, Endon, to Bakewell, Sheffield, Holmfirth, Woodhead, Glossop, Longnor, and back to Endon, 113 miles. Of fourteen entrants, twelve started. Result: 1, J. A. Prendergast (3½ Rudge), 97½ marks, gold medal; 2, G. Jones (3½ Zenith), 94¾ marks, silver medal; 3, G. Tagg (4¼ Regal-Precision), 30 marks. The marks obtained in this trial count towards the Ashton Reliability Challenge Cup.

Lincolnshire A.C. (Motor Cycle Section).

A social meeting with the East Yorkshire Motor Cycle Club will be held at Scawby Gull Ponds (about three miles S.W. of Brigg), on Saturday, the 22nd inst. Members should arrive at Scawby by 3.30 p.m.

The latest type of L.M. cyclecar, built by W. M. Cunningham, of Clitheroe. The L.M. was one of the original light quadcars, and has been greatly improved in appearance.

Finsbury Park C.C. (Motor Cycle Section).

The result of the speed-judging competition on the 1st inst. was as follows:

		Points.
1.	R. Gordon Bassett (Rudge)	90
2.	J. Evans (Bradbury)	88
3.	R. Hazell (Kerry)	87
4.	C. F. Revelle (Triumph)	87

Stroud and District M.C.C.

The club held a reliability trial to Weymouth and back on Whit-Monday and Tuesday for the challenge cup presented two years ago by the Triumph Cycle Co., Ltd. Secretly observed checking was worked very successfully at several points *en route*, and the winner, A. C. Ratcliff (B.S.A. two-speed), completed the course of 230 miles with only a little more than six minutes variation from schedule time. F. W. Meadows (Alldays) and P. F. Withey (Triumph) are the winners of the consolation prizes.

Surrey M.C.C.

The Guildford to Exeter reliability competition for the Triumph Cup and other prizes will take place on the 18th and 19th inst., and the start will be at 11 p.m. from the Angel Hotel. The controls will be at Guildford, Yeovil, Honiton, Exeter, Salisbury, Winchester, and Guildford.

H. C. Newman (3½ h.p. Ivy-Precision and sidecar) approaching the bend in Class 7 of the Harley Bank hill-climb organised by the Birmingham M.C.C.

Furness M.C.C.

Result of petrol consumption trial on the 2nd inst.: 1, E. E. Clow (6 Zenith and sc.), 88 miles and 25.6 ton-miles per gallon; 2, M. Bradbury (2¾ Douglas), 174 miles and 24.6 ton-miles per gallon; 3, H. C. Wilkins (3½ Humber), 119 miles and 21.5 ton-miles per gallon. The route was Barrow, Newby Bridge, Newton-in-Cartmel, Grange, Allithwaite, and Barrow. Total distance, forty-nine miles.

Manchester M.C.

The result of the Manchester Motor Club Whit-week three days' reliability trial over a course extending through North and Mid-Wales, Aberystwyth, Llandrindod Wells, Knighton, Hereford, Gloucester, Warwick, etc., finishing at Stonebridge, total distance nearly 400 miles, is as follows: C. E. Kettle (3½ h.p. chain-drive two-speed James and sidecar) and W. Heaton (2¼ h.p. two-speed chain-drive A.J.S. solo) tied for first place, F. Syrett (5 h.p. Indian) being third. The first and second prizes, value £5 and £3 respectively, to be divided. The Triumph Cup to be run off by the above-mentioned riders at a future date on reliability only.

The course was extremely hilly, and the roads in many places slippery and unsafe. Heaton and Kettle both had one stop each, the former a puncture and the latter a sooted plug.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Hull to Swansea.

Would you please let me have the best route from Hull to Swansea avoiding as many hills as possible? The trip proposed is with a 3½ h.p. Centaur and sidecar, total weight of driver and passenger twenty-four stone, therefore I wish to avoid hilly districts.—L.L.S.

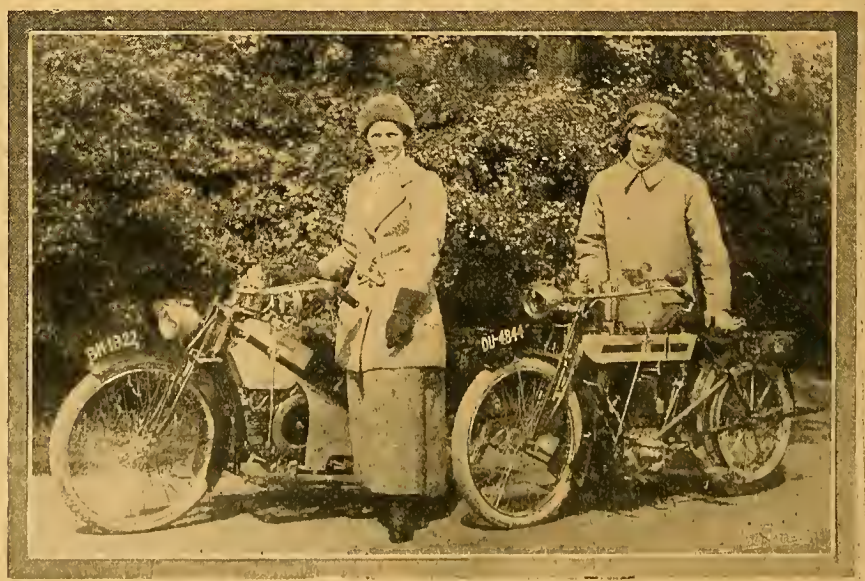
Your best route would be as follows: Hull, by ferry to New Holland, Brigg, Lincoln, Sleaford, Falkingham, Bourn, Stamford, Uppingham, Rockingham, Market Harborough, Rugby, Warwick, Stratford-on-Avon, Evesham, Tewkesbury, Ledbury, Hereford, Willersley, Three Cocks, Brecon, Llandovery, Llangadock, Llandilo, Pontardulais, to Swansea. We are afraid you cannot avoid hills when entering Wales. The route we have given you is the best one, avoiding as many towns as possible.

Hard to Start After Cleaning.

(1.) My machine is a 5 h.p. twin Rex 1909 pattern with Bosch magneto. It ran well last year and started easily. I have taken off cylinders and cleaned thoroughly, but have not disturbed the timing gear. I have ground in the valves and the compression is very good. On reassembling it starts easily on the stand and each cylinder fires regularly, but I cannot get it to start with a run. (2.) I propose having a free engine clutch fitted; which will be the better, a Mabon or Albion clutch? The machine is used with sidecar. (3.) In timing the magneto (chain drive) which cylinder do you time? (4.) The belt, a Whittle 2in., has run about 1,500 miles and does not show any signs of wear, but it slips badly. I have treated it with castor oil during the winter, but it still slips; can you suggest a remedy?—J.D.

(1.) Probably there is some leak in the inlet pipe joints or carburetter. This very easily occurs when reassembling an engine, and if you carefully overhaul the joints we think you will soon get the machine to start easily. (2.) Either of the two clutches should suit your purpose. (3.) You can time whichever cylinder you like. When one is right the other is right. (4.) We should recommend you to examine the pulley and see if it is badly worn; also scrape the belt carefully and dress it with collan oil. This is better for leather than castor oil.

Exhaust Timing.



(1.) I ride a 1911 machine, 3½ h.p., of well-known make, which knocks badly on hills or when more gas is given after slowing down; moreover, I do not get more power at full than at half throttle. The gear and the valve timing are as the makers left them. In going over the timing of the valves I find that the exhaust valve closes before the piston reaches the top of the stroke (quite half an inch). Does this account for the trouble? (2.) Can the closing of the exhaust valve be altered without disturbing the point of opening? (3.) Would the magneto timing be affected by the re-timing of the exhaust? If so, what ought to be done? (4.) Can you suggest any other remedy for loss of power and knocking? The compression is quite good.—T.O.

(1.) It seems that the timing of the exhaust valve is much too early. It should close when the piston reaches the top of the stroke, or a little later, and should open when the crank pin is 45° from the bottom of the firing stroke, *i.e.*, about half an inch. This will certainly cause bad running. (2.) You cannot alter the closing of the exhaust valve without also altering the opening thereof. (3.) The magneto will not be affected by the timing of the exhaust. (4.) The trouble might also be caused by carburetter adjustment.

Sheep on the Highway.

I was travelling at 10 m.p.h. on my motor cycle down the long hill that connects Tetbury with Bath, the other day, when I saw a flock of about ten sheep at 300 yards ahead; they were on the proper side of the road. When I got within six yards, however, one of them came out under my front wheel, causing my discomfiture in the dust a few yards further on. I was not hurt, but the machine was. Kindly tell me what I should have done as regards taking names and addresses, with a view to recovering damages.—K.S.K.

We very much doubt if you could get damages. The defence would be that having seen the sheep and knowing that they are unreliable animals and likely to run across your path unexpectedly, you should have taken due precaution and dismounted, if necessary. If you thought of fighting the case, however, you should have asked the shepherd the name and address of the owner, and taken the drover's name and address as a witness, which he would, of course, have given.

ANOTHER MOTOR CYCLING MARRIED COUPLE.
Mr. and Mrs. Kirkpatrick, of Bedford, with their 3½ h.p. Triumph and 2¾ h.p. Douglas motor cycles.

LONDON—EDINBURGH—LONDON RUN.

Welcome to our Showrooms.

We shall be pleased to have a call from Provincial customers visiting London. Our premises are central and most accessible from every point. They are a few doors West of Chancery Lane and nearly facing the First Avenue Hotel. One minute only from Chancery Lane, Central London Tube Station, and two minutes' East of Holborn Station, on the Piccadilly and Brompton Railway, both lines being linked up with the whole of the London underground system and principal termini. We are also within two minutes' walk of Kingsway-Tramway Station on the connecting link between the Northern and Southern systems of the County Council Tramways, bringing us within easy reach of all suburban districts. 'Buses from all parts of London pass the door. Machines can be stored at our Garage. Hours of business 9 to 7, Saturdays 9 to 1.

THE SERVICE Co., Ltd., 292-293, High Holborn, London, W.C.

Telegrams: "Admittedly, London." Telephones: 260 Central, 2071 City.

THIS WEEK'S SPECIAL LINES.

Good **SERVICE RUBBER-STUDDED COVERS,** recommended for sidecars, **27/6** each.

The **SERVICE ADJUSTABLE BACK REST,** simple and efficient in operation, fits most saddles, **10/6**

SERVICE HANDLE-BAR MIRRORS, best finish, 3in. **3/9,** 2½in. **2/6.**

SERVICE SIDE CARRIER BAGS. A popular bag, extra strong make, fine quality leather, **12/8** per pair.

C.Q.R. ADJUSTABLE BELT FASTENERS, for ⅞in. and 1in. belts, usual price 2/0, reduced to **1/6.**

"BELTICUM," the famous preparation for prevention of belt slip, **6d.** per tube.

The **SERVICE SELF-CONTAINED SIDECAR LAMP, 8/6.**

50 26 × 2¼ **REINFORCED ENDLESS TUBES,** 5/6 each.

The **SERVICE POST HORN,** well made, heavily plated, and with a clip that will not break or pull off, **15/-**

Good **SERVICE RUBBER BELTING,** Service quality, ⅝in. **1/2,** ¾in. **1/5,** ⅞in. **1/8,** 1in. **2/-** per foot.

The **SERVICE COMBINED PETROL TANK AND NUMBER-PLATE,** an accessory of real use, **3/8.**

Special Lamp Offer.—Lamp, with aluminium convex reflector, good quality drip generator, complete with tubing, **13/6.**

Large Stocks of **Kempshall, Continental, Palmer, Dunlop, John Bull, Good Service,** and other makes of Tyres and Tubes.

SOLE LONDON AGENTS for **C.A.P. Carburetters, Leamington Chairs, A1 Mudscreens, Voltalite Magneto Lamp Set.**

SPECIAL AGENTS for **F.R.S. Lamps** and **Lukin Carburetters.**

Decompressor for Triumph.

Can you tell me whether the P. and P. decompressor is suitable for the Triumph, efficient and fairly reliable? Or if not, can you recommend any other devices to make easier the running start?—W.C.B.

We do not think that there is any doubt as to the suitability of the decompressor mentioned. The manufacturers, Messrs. Packer and Prentis, Roden Street, Ilford, E., will, of course, tell you if it can be easily fitted to a 3½ h.p. Triumph.

Sheffield to Glasgow.

Please let me know—(1.) The best and shortest route from Sheffield to Glasgow, and the total distance? (2.) Time required to do journey comfortably on a 2½ h.p. three-speed machine? —W.M.

(1.) Your best route would be as follows: Sheffield, Rotherham, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, along Leeming Lane, through Scotch Corner, Barnard Castle, Middleton-in-Teesdale, Alston, Brampton, Longtown, Gretna Green, Lockerbie, Beattock, Abington Inn, Hamilton, to Glasgow. The distance is approximately 260 miles. (2.) You can do it easily in two days.

Three-wheeled Runabouts.

I wish to purchase a two-seater three-wheel runabout, and would like your advice on the following two types, the Morgan and A.C. Sociable. (*a*) Are they quite reliable? (*b*) Are the clutches well designed and up to their work? (*c*) Are they comfortably sprung and silent running? (*d*) Are the engines liable to overheat easily in hot weather? I prefer the design of the Morgan, but have not seen many on the road, and consequently would be indebted if you would let me know if they are quite satisfactory.—F.W.T.A.

We should say that the runabouts in question are quite reliable. The clutches and gears are satisfactory. They are well sprung, run silently, and are unlikely to overheat, and are perfectly satisfactory, as witness their performances in reliability trials. It is a matter of individual preference.

Hard to Start.

I have a 5-6 h.p. twin Rex (1908) which is very difficult to start. It has been in garage and is very little, if any, better. The back cylinder misses firing every now and again, and when it picks up the machine practically jumps. It will take very little air; if much air is given it seems to choke. It is a machine which was built for speed, but we are using it for sidecar work, as it is very powerful when both cylinders work. I should be pleased if you can tell me what is the best to do.—A.E.C.

We should say that the carburetter is partially choked up or there is an obstruction in the tank or petrol pipe. Examine the magneto and see that the high tension carbon brushes are making good connection on the collector ring. Also verify the setting of your plugs. When you get the carburetter clear and a good flow of petrol through the jet we think you could start more easily. If, as we think, the carburetter is obstructed, you will, of course, be able to give more air when this obstruction has been cleared.

Single or Twin for Sidecar.

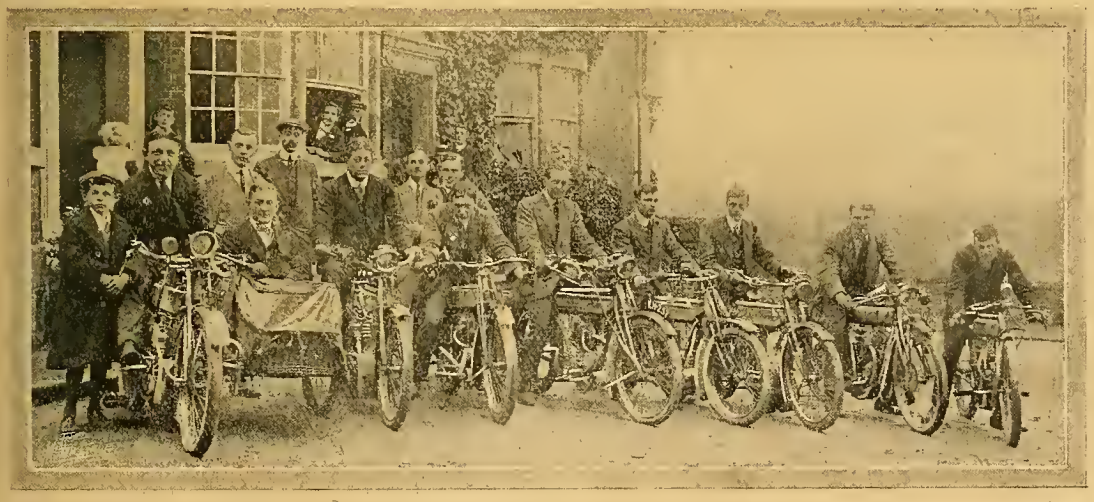
(1.) If two sidecar combinations were built up exactly alike as regards frame design, type of wheels, tyres, etc., and both geared the same, one machine being a single and the other a twin, which machine would cause the most vibration when travelling at a given speed, say 20 m.p.h.? (2.) Which of the two machines would be most liable to overheating? (3.) Is a large air-cooled twin (say 8 h.p.) liable to overheat on a sidecar if no fan is used to cool it, provided that it is properly driven?—A.L.

We should say that more vibration would be obtained from the single-cylinder as the twin is better balanced. It is impossible to say which would be the more likely to overheat as overheating depends upon so many causes. Theoretically the twin should keep the cooler as the work is divided up between the two cylinders. An 8 h.p. twin can be driven with a sidecar minus a fan without there being any trouble through overheating.

Brondesbury, N.W., to Tonbridge.

Can you tell me the best way to take from Brondesbury, N.W., to Tonbridge? I have been by Hammersmith Bridge and Barnes, but went *viâ* Sutton and Redhill, which is a long way round, as I have thirty miles to go beyond Tonbridge. I wish to avoid traffic as much as possible.—E.F.G.

The best thing you can do is to get a copy of the new official map of the R.A.C. of recommended routes. "Into, Out of, and Round and Across London," which can be obtained price 1s. 7d. post free from these offices. If you look at this, you had better take the following route: Cavendish Road, Wrentham Avenue, Bathurst Gardens, Wood Lane, Shepherd's Bush, Hammersmith Broadway, Castelnau Road, Barnes Common, Roehampton Lane, straight across Putney Heath, turn to the left at the end of this road into High Street, Wimbledon, Merton Road, past the Grove Hotel, Mitcham Station, where turn to the left and then right and follow the tramlines along the Croydon Road, and after the railway bridge take the first turning on the right passing Deddington Lane Station; go as straight as you can past the Plough Inn, and you will come out at Purley Corner; continue as far as Warlingham, turn left under the railway bridge, go up Warlingham Hill, which will take you straight to Westerham, then reach Tonbridge *viâ* Westerham, Crockham Hill, and Leigh. This is the best route we know of.



EXPERIENCES WANTED.

"Z.Y.X." (Aberdeen). Baby Levis or Touring Levis two-stroke machines.

"S.F.B.L." (Cork). 3¾ h.p. twin clutch Premier, particularly as regards engine vibration and slow running.

"D.H." (Birkenhead). N.S.U. two-speed free engine device as fitted to an A.J.S. lightweight, particularly as regards wear and disorders.

"T.C.B." (Bangalore, India). (1.) Bowden two-speed gear with 1911 Triumph and sidecar. (2.) Ponder's attachment for steering motor cycle from sidecar seat. (3.) Amac and P. and P. decompressors.

Members of the North Staffordshire A.C. who took part in the reliability test from Endor to Sheffield.

A Splendid Result.

The statement of accounts for Brown Bros., Ltd., for the year ended December 19th, 1911, shows a profit of £30,642 10s. 11d.

Bradbury Machines in the M.C.C. Run.

A. Peppercorn, who won a gold medal in the M.C.C. run from London to Edinburgh, rode a 3½ h.p. Bradbury. Thus nine Bradbury riders were successful in gaining medals on this trip.

Motor Cyclists and the A.A. and M.U.

Motor cyclists are reminded that they are now entitled to the whole of the advantages of A.A. and M.U. membership at the subscription of 10s. 6d. per annum. This extension of privileges, recently instituted, has resulted in a considerable number of motor cyclists joining the Association. During the past month 1,397 became members.

London-Edinburgh Run.

The Hutchinson Tyre Company inform us that out of thirty-eight competitors whose machines were fitted with Hutchinson tyres in the London to Edinburgh run all finished the outward journey satisfactorily. On the return journey, twenty-seven of the machines fitted with Hutchinson tyres started and twenty-seven finished. Many of the successful competitors have sent their congratulations to the Hutchinson Tyre Company.

Among the makes of lamps which "shone conspicuously" in the London-Edinburgh run was the Lucas.

George Brough, who for the third time in succession won the Motor Cycling Club Challenge Cup, used Wakefield "Castrol" oil and John Bull tyres on his 3½ h.p. Brough.

The London to Edinburgh run proved once more the reliability of Palmer tyres. The machines shod with "the tyre that is different" scored four gold medals for the double journey, and four gold medals for the single journey, as well as the Wells and Clark cups, won by the Clyno, for the best performances respectively on the single and double journeys.

Insurance of T.T. Riders.

Ernest J. Bass, of Bishops Stortford, has a special policy for T.T. riders, covering personal accidents whilst practising and during the race.

Tyre Reliability.

We are asked to state that J. L. Norton's retirement from the Birmingham-Land's End run was not due to tyre troubles as stated, the Hutchinsons fitted to the machine going through the journey without the necessity for the use of a pump.

An Enthusiastic Report.

A Watford rider of a Bradbury machine called at the local agents the other day and had a Binks carburetter fitted to his machine. A short time afterwards the same firm were surprised to receive the following telegram: "God bless Binks.—Edwards." Which is a sure enough indication that the rider in question was delighted with the change.

Longevity of Tyres.

We are in receipt of a booklet from Messrs. J. Pedley and Sons, Ltd., Oxford Works, Great Charles Street, Birmingham. The introduction is based on an extract from the Judges' Report of the Spring One-day Trial, 1912, to the effect that it is highly desirable that heavier tyres should be made for use on motor cycles. Messrs. Pedley claim that they have been carrying out this practice for the last two years. Every tyre is built for touring purposes and is constructed on similar lines to a motor car cover. In the book Pedley tyres, tubes, and belts are listed.

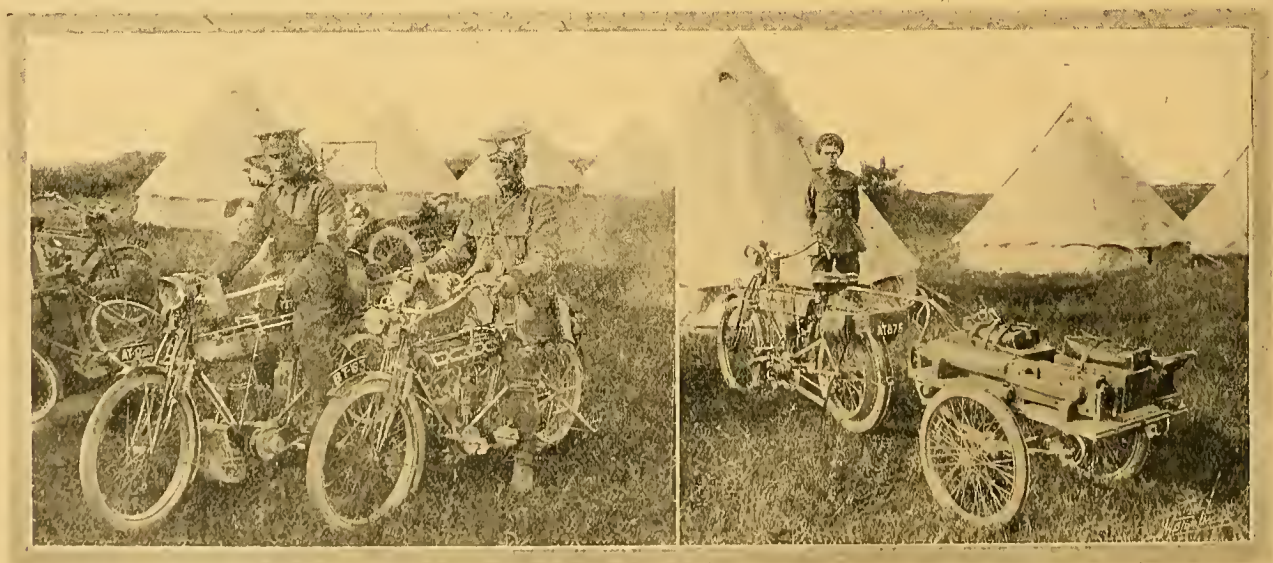
New Machines by Easy Payments.

Hitchen's Motor Exchange Co., Ltd., Morecambe, are disposing of their stock of second-hand machines, having decided to devote their attention to selling new pattern motor cycles on the deferred payment system.

The Future of the Levis.

Messrs. Mahler Bros., who handle the Levis two-stroke lightweight motor cycle, inform us that they have now converted their business into a limited company, which will trade as Messrs. Mahlers' Ltd. Mr. Vernon H. Mahler and Mr. H. W. Mahler are joint managing directors.

Interesting Presentation.



In recognition of his eighteen years' services with the Triumph Cycle Co., Ltd., Mr. E. L. Roberts, head of the Triumph engine department, was the recipient of a gold watch and albert, subscribed for by the workmen under his control, the managers of the company joining in the presentation. A dinner at the White Lion Hotel, Coventry, preceded the ceremony, Mr. Schulte handing Mr. Roberts the gift.

The Brampton Variable Gear.

Regarding the description of the Brampton variable pulley gear which appeared in our last issue, we are asked by the makers, Messrs. Brampton Bros., Ltd., Oliver Street Works, Birmingham, to state that the gear has been designed for use on lightweight machines and 3½ h.p. solo mounts.

J.P. 3,000 Mile Tyre.

We have been using a John Piggott rubber studded tyre on the driving wheel of one of our 3½ h.p. machines, and after 900 miles it shows little if any sign of wear, and there is only one small cut in the tread. It has never punctured. Judging by the thickness of the rubber, it would appear to be easily capable of its guaranteed 3,000 miles. We shall have more to say about it later in the year

Two motor cyclist sergeants of the 5th East Yorks, Cyclists' Battalion at the week-end camp at Hornsea. The machines are a Zenith and twin Centaur.

Novel carriage for Maxim gun and accessories belonging to the 5th East Yorks, Cyclists' Battalion. It is attached to a 3½ h.p. Bradbury.

Harrow-on-the-Hill,
June 3rd, 1912.

Gentlemen,

Re the ROM 1in. belt which I used during the A.C.U. Six Days' Trial, gaining the Gold Medal, I must admit it absolutely surpassed my expectations, never once requiring the slightest attention, and, in addition to the six days, it was used in the A.C.U. Team Championship, A.C.U. Quarterly Trial, and several minor events with sidecar, in which I gained highest awards.

Yours truly, W. COOPER.

See that Security Sleeve ?

It overcomes the one disadvantage of the Butt-ended Tube—bursting at the ends. It is the feature of the **"Challiner" Patent Butt-ended Tube.** With it you have the security of the endless tube and the handiness of the butt-ended one.

The Security Sleeve is fixed to the rim by the winged nut and bolt; the butt ends of the tube fit in it like a glove.

The centre of the Security Sleeve is a bulkhead of insulated canvas which makes *bursting of the ends an impossibility.*

'Challiner' Patent Butt-ended Tubes are burst-proof at the ends.

If a tyre fitted with this tube were inflated to bursting point, *the burst could not occur at the ends.*

The bulkhead keeps the Tube ends firmly in position; and being fixed to the rim directly opposite the valve, it prevents all 'creeping.' "Creeping" of the Butt-end Joint is what causes other tubes to burst.

Fit "Challiner's" to your mount now!

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

'Phone: Holborn, 5777.
Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

NEW 1912 Motor Cycles in stock, for immediate delivery:

DO YOU KNOW

the pleasure of driving a really satisfactory, efficient, and economical motor cycle? If not, investigate the merits of the 1912

REX-J.A.P.

COPY OF TESTIMONIAL.

Wheatlea House,
Meole Brace,
Shrewsbury.

Gentlemen,

I think the time has come, now that I have given my 6 h.p. REX-J.A.P. a thorough testing, to write and say how very pleased I am with it.

Most of us know and are willing to acknowledge that the REX Company for many years have had the IDEAL RIDING POSITION, and this, combined with the J.A.P. engine, leaves nothing to be desired.

During the past eight years I HAVE HAD FIFTEEN MACHINES, all of them singles, excepting one, an automatic twin (the less said about this the better), but had I known the comfort and delight of the twin, I should have launched out long ago.

I can get 85 MILES TO THE GALLON, and the engine is one of the cleanest I have ever seen—hence low oil consumption.

I shall be delighted to demonstrate her capabilities at any time I can be of service to you.

Wishing you the luck you deserve, and thanking you for your prompt and courteous attention.

Yours truly,
(Signed) CECIL RICE-OXLEY.

We have many similar letters of appreciation from Private Owners. May we have the pleasure of sending our Catalogue, together with copies of these letters?

AGENTS! are you in a position to deal with the enormous demand this year for sidecar machines? If so, write for the Rex-Jap agency terms.

The Premier Motor Co., Ltd.,

Aston Rd., BIRMINGHAM.

TELE { grams: "Primus," Birmingham. phone: Central 4310.

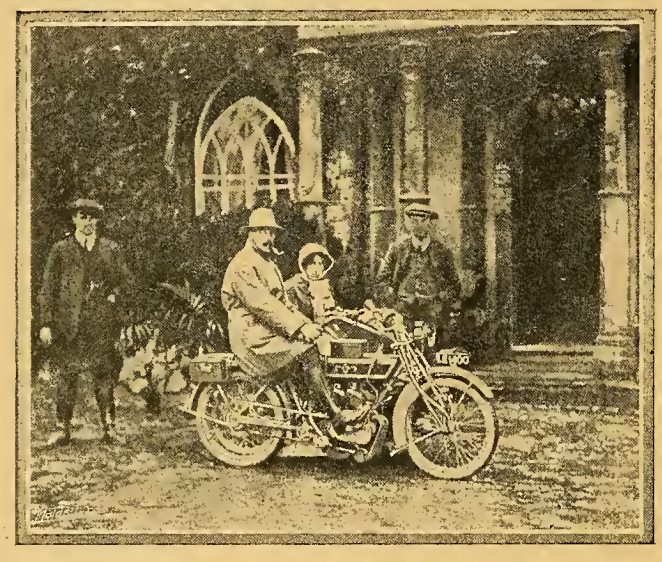
Overloading.

OUR advice to beginners who frequently ask what horse-power machines they should purchase is that much depends upon the conditions under which the motor cycle has to work and the nature of the country in which that work has to be done. For example, for an unmechanical novice 2 or 2½ h.p. Such a man could probably start away with a 3½ h.p. with perfect safety, but it is better to be on the right side. For the average beginner a 2¾ h.p. twin; for the average individual slightly acquainted with the theory and practice of the pastime a 3½ h.p. single; for the worshipper at the shrine of the goddess speed the twin up to 7-8 h.p.; for those content with a moderate speed in a level country, and who wish to take a companion, the 3½ h.p. with change-speed gear and sidecar; for a married couple who want to climb all hills a powerful twin with change-speed gear and sidecar. All of which we consider to be sound advice based on long experience.

The practice of overloading the willing engine is, however, growing, and it is no uncommon sight to see a 2¾ h.p. twin with a passenger on the carrier, a 3½ h.p. and sidecar (occupied) with a passenger on the carrier, a 7 h.p. twin with a passenger and child in the sidecar, and a passenger on the carrier as well. Doubtless the willing engine makes a brave showing under abnormal loads such as these, and the thoughtful manufacturers have provided a margin of safety which allows the engine just to scrape through under these unfair conditions, but there are parts of the machine in which there is often next to no margin of safety, and this should be obvious to almost anyone. We refer, of course, to tyres and transmission.



The weight of an extra passenger on the carrier puts a terrific strain on the rear tyre cover, and trouble is sure to ensue if the practice be indulged in continually. The transmission suffers as badly when it has to put up with such usage. Moreover, heavy loads demand a generous throttle opening, and inasmuch as the whole art of driving an air-cooled engine lies in keeping it running on as little gas as possible, overheating and valve troubles are invited. Were the average motor cycle engines water-cooled they would stand more abuse, but as they are not, the rudiments of air-cooled engine driving must be observed. Furthermore, the overloading of sidecar machines puts grossly unfair strains upon the bicycle frame and that of the sidecar and its connections, stresses which they were never intended to bear.

All of this is intended to urge riders to use commonsense in the use of the vehicles which come into their hands. To get the best out of their mounts, the latter must be used fairly and not abused, and it is to be feared that, unless due notice is taken of our warnings, the abuse of overloading will end in some cases in disastrous results. Finally the question of pulling the load is not the only one to be considered. Even more important is that of stopping. Heavy bodies, as our elementary mechanics tell us, acquire tremendous momentum once they are set going, and those who overload their mounts altogether beyond the point for which they have been designed may one day find that the brakes fitted for use under normal conditions will prove inadequate when absurdly heavy loads are carried. It should hardly be necessary for us to point out that failure of the brakes may have very serious consequences.

A.C.U. SIX DAYS' TRIALS.

SUMMARY OF AND COMMENTS ON THE REGULATIONS.

THE regulations for the Six Days' Trials are now issued to the public. The manner in which these are arranged, and the index at the beginning of the pamphlet, reflect great credit upon the secretary of the Auto Cycle Union. Reference has already been made in *The Motor Cycle* to the routes which will be followed through the glorious West

Mr. and Mrs. T. W. Loughborough (8 h.p. Matchless sidecar) outside Clark's Hotel, Taunton. The new A.C.U. secretary has been over the Six Days' Trials route.

Country, and it now remains only to refer to those points in which this year's rules differ from those of last year.

Passenger machines may be motor cycles with sidecars (the latter, by the way, must not be detached during the trial) or cyclecars; and this is the first important trial in which the cyclecar class may compete.

Important Rule regarding Cyclecars.

Cyclecars must be fitted with a free engine and a change speed gear *(controllable from the driver's seat and while the vehicle is running)*, comfortable body, tyres not less than 2½ inches, etc. Every driver of a passenger machine must supply a full-sized waterproof rug for the comfort of the observer.

Competitors must have their machines ready for sealing previous to the beginning of the trial. That is to say, the wires must be in position round the cylinders and frame ready for the seals to be affixed.

The trial is open to genuine tourist machines only. A list of what may and may not be carried in the way of spares is given. Tyre repair outfits, sparking plugs, valve complete, magneto parts, belts, belt fasteners, chains, tyre levers, inner tubes, control wires, and nuts and washers may be taken, but no other spare parts of any description may be carried on the machine or on the person of the competitor or passenger.

A reasonable quantity of tools, including a small soldering outfit if desired, is allowed. This is a generous regulation which imposes no hardship on the private owner who likes his machine to be equipped against any emergency.

The cost of entries is as follows: Trade entries, £5 5s. for the first machine, and £4 4s. for every additional entry, not exceeding three in all; trade entries from agents on their own account, £4 4s. each machine; private owners, £3 3s. each machine; private owners who are members of the Auto Cycle Union or affiliated members, £2 2s. each machine. Manufacturers of tyres may enter them separately. For a report on the tyres on one machine £2 2s. will be charged; for the report on the tyres of any additional machine 10s. 6d. Tyres entered will be marked, and every change of tyre cover or tyre repair made under observation involves a loss of five marks. Entries at ordinary fees close on July 29th; late entries will be accepted up to and including August 3rd at double fees, and should be sent to the Secretary, Auto Cycle Union, 89, Pall Mall, S.W. Machines must be at the official storage depot at Taunton at 10 a.m. on August 11th.

System of Marking.

Each competitor will be credited with 1,000 marks at the beginning of the trial. The schedule time will be calculated on a basis of twenty miles an hour. Any competitor passing any point in the route more than ten minutes in advance of or behind the schedule time for that point will be penalised ten marks for the said ten minutes, and one mark per minute in excess of that period. That is to say, any competitor may be ten minutes late or early of schedule time without loss of marks.

Competitors will be timed over secret sections, and if this proviso be efficiently carried out it should put an end to scorching and waiting outside controls, whereby many riders have secured time for an unpenalised repair or adjustment in past trials.

A competitor arriving late at the end of the morning section may waive part of the luncheon interval of one and a half hours. Twice during the trial the condition of the brakes on the competing machines will be tested, and marks not exceeding ten will be

A 3½ h.p. three-speed Rover climbing Beggar's Roost. This hill, which has a gradient of 1 in 3½ may be included in the Six Days' Trials

A.C.U. Six Days' Trials—

A new view of Porlock Hill between the two bends. The hill is included in the Six Days' Trials route.

deducted for any imperfection. Machines must make a clean ascent of the test hills (pedalling, assisting with feet, or running alongside will not count as a clean ascent), failure to do so involving a loss of fifty marks. As the maximum marks are 1,000, and 950 are required for a gold medal, one hill failure, plus the loss of a single mark for any other cause, will lower a rider to the silver medal class.

Pedalling is only allowed on single-geared lightweights (300 c.c. singles, 350 c.c. twins), and if indulged in will be recorded on the machine's certificate. Passenger machines must ascend the hills with passenger and driver seated in a normal manner. Certain sections of the route will be non-stop sections. Each stop in these sections involves a loss of five marks. This rule is probably framed for two reasons: (1) To prevent cooling and adjustment stops at the foot of test hills; (2) to test the rider's dexterity in handling his machine on unfamiliar sections of an extremely tricky nature.

Condition of Machines at End of Trial.

In arriving at the awards the condition of the machines will be taken into consideration by the judges, and five marks will be deducted for any ascertained defect. A quarter of an hour only each morning will be allowed for adjustments.

Owing to the crowding this period will barely suffice for refilling tanks, and in no case can it suffice for any vital repair or adjustment. Probably most riders will take opportunities of refilling their tanks along the route, and will utilise the morning interval for examining their machines.

The Awards.

Gold medals for 95% of marks obtainable, silver medals for not less than 85%, bronze medals to all who complete the trial within an hour of the schedule time and with machines in good condition, and who have otherwise fulfilled all the conditions of the trial. In addition there will be two team prizes for the best performances by a team of three trade riders and a team of three private owners nominated by an affiliated club, also numerous other special prizes.

Two of the special prizes are earmarked for *slow* hill-climbs, but the regulations at present contain no other mention of slow climbs. Obviously if these prizes are offered for competition on the test hills nobody will deliberately compete, as a failure would spell a loss of 50 marks on the medal score. Presumably the slow climb prizes will be awarded on tests separated from the main trial and outside the time schedule, so that loss of time or failure will not affect a rider's main score. Otherwise nobody will consider these awards unless he has already lost all his medal marks.

Every one of the new regulations represents an urgently needed reform, and the changes have been exceedingly well thought out. They bear the hallmark of a practical organisation in every detail, and reflect great credit on the management. Humanly speaking, they are an assurance to private owners all over the world that a machine which gains an award in the 1912 trials is completely road-worthy, and that duplicate machines are well suited for hard service in any country that possesses roads.

The fact that the secretary, who is a notoriously good organiser, has carefully made arrangements well beforehand, and gone over the whole route on a Matchless motor bicycle and sidecar, should do much towards rendering the trial the success we hope it will be.

TYRE TESTS IN THE SIX DAYS' TRIAL.

We have already commented on the excellent idea, originally suggested in *The Motor Cycle* and adopted by the A.C.U., for the Six Days' Trials to have a separate test of tyres. The difficulty, however, which does not seem to have been realised by the organisers, is that, according to the regulations, there is nothing to prevent manufacturers producing a special tyre for the trials. It is well known that, even by analysis, it is difficult to prove that covers and tubes have been specially made, and outwardly there is no indication of the fact. To prevent doubts arising in connection with this point, we suggest that it would be an excellent plan for the A.C.U. to make arrangements for the purchase of tyres by independent persons from the stock of those manufacturers who desire to enter tyres in the trial.

The organisers have arranged to mark all covers used in the trial, but a check should also be made upon air tubes used in conjunction with the covers, so that they could be penalised if necessary.

Three-speed Hubs and Side-slip.

Nothing is more gratifying to an old variable gear enthusiast like myself than to hear such glowing accounts of riders' experiences with the three-speed hubs. Not every user is familiar with a rather obvious tip in this connection. There is nothing like a low gear ratio to steady a wobblesome machine over a dangerous patch of grease. When I feel my back wheel playing pranks I instantly change down on to the intermediate gear, and if sufficient pace on this gear is uncomfortable, I change right down on to the bottom ratio. It is safe and easy to drive at 20 m.p.h. on bottom gear over surfaces which render slower speeds perilous on either top or middle gears. Of course, such engine-racing should only be indulged in for brief periods or in serious emergencies.

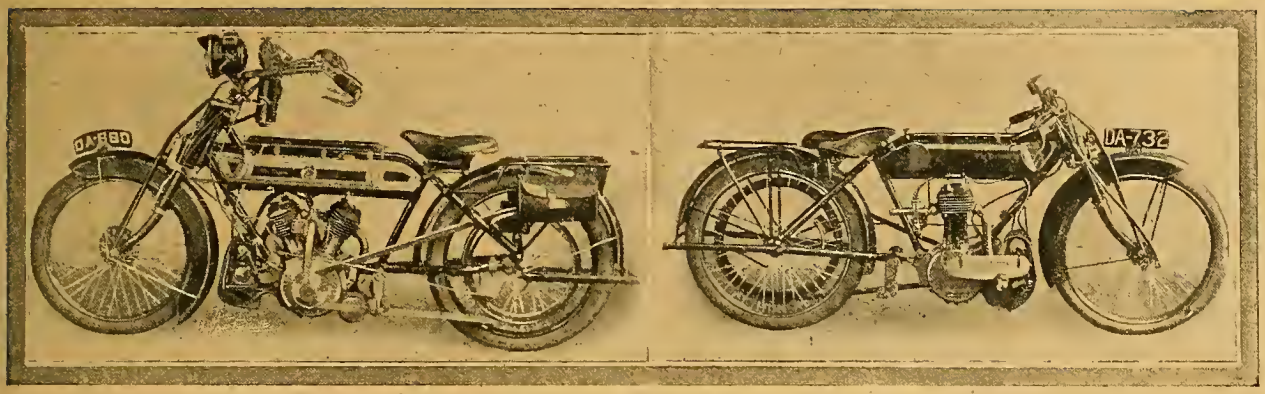
A Tank Suggestion.

Last year the Rudge machine embodied a marked improvement of the simple sort which makes us all ejaculate, "Why did nobody think of this before?" The petrol tank contained a little dam or semi-partition which trapped a few ounces of petrol, so that when the machine began to spit in that irritating fashion which betokens an emptying tank, you had only to lift the front wheel high in the air and let the fluid run over the partition to travel a few miles further. The idea was not well carried out on my machine, as the dam was too low, and the petrol got jerked over it on bad roads, so that on the one occasion when my fuel got low, the remnant behind the dam only carried me two miles. But here is the suggestion. Most tanks hold about 1¼ gallons. Why not construct the tanks in two compartments, each controlled by a separate tap or needle valve; the main tank might hold one gallon precisely, the auxiliary tank the quarter or half gallon, whatever the surplus is. We should then be freed from the annoyance of waiting for a measure at garages, which is a real hindrance in reliability trials with a large entry. The trade would soon learn that the main tank of a 1913 Triumph, Rudge, or Bradbury, holds exactly a gallon, neither more nor less; and the subsidiary tank would be large enough to ensure twenty-five miles running when the main tank ran dry.

Multi-speed Hub Design.

With further reference to my article on "Hub and Counter-shaft Gears," I should explain in reply to correspondents that two arrangements of three-speed hub trains are at present in vogue. These hubs use two reducing sun and planet trains; the Armstrong hub has the solid drive as the middle gear, and takes both top and bottom gears through one train apiece; the Sturmey-Archer hub takes the solid hub as top gear, middle gear reduction through one train, bottom gear reduction through both trains. The conflict of opinion is due to the following considerations. If you make top gear the direct drive, you get a largish engine pulley for all gears, and can get a low bottom gear with a fair-sized engine pulley. If, on the other hand, you make one reduction through both trains, you get double friction on bottom gear. The frictional loss on each separate reduction is probably about 10%. A four-speed hub could be obtained by using one reduction for second and third speeds, and a double reduction for fourth speed. A four-speed hub would thus be very little more complicated or heavy than the existing hubs; it would demand no increase in the number of pinions, but its internal control parts would be a trifle more complex and numerous, and so its size and weight would be increased.

Sidecar Novices.



Everybody must learn to drive somewhere and sometime, but I think a protest would be timely against youngsters who have no experience of motor cycling fitting a sidecar as soon as they receive delivery of their machine, and learning to drive a motor and to steer a sidecar simultaneously. Last week there were two or three ugly smashes in my district, all due to novices imagining that it was safe to make their motoring essays with a sidecar, and in all the instances the sidecar appears to have been imperfectly adjusted.

The 1912 novices should clearly understand that some practice is needed before a tyro can escape being a public danger even when he drives a vehicle which steers as naturally and automatically as a motor bicycle: the deceptiveness of speed is a large factor. But when the raw novice endeavours to acquire speed experience on a machine as tricky to steer as a rigid sidecar accidents are bound to follow.

The novice would be well advised not to attempt sidecar work until he has enjoyed about 1,000 miles of solo experience. Otherwise the first emergency will find him either losing his head completely, or concentrating his attention solely upon steering and ignoring his brakes and throttle, or *vice versa*.

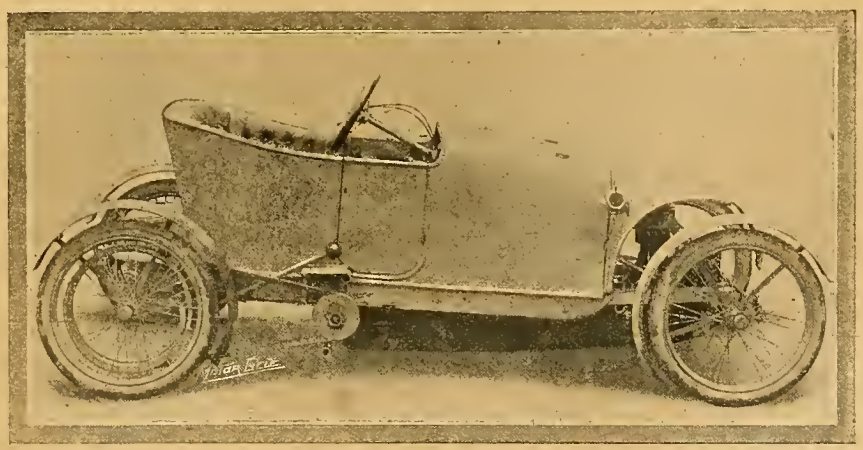
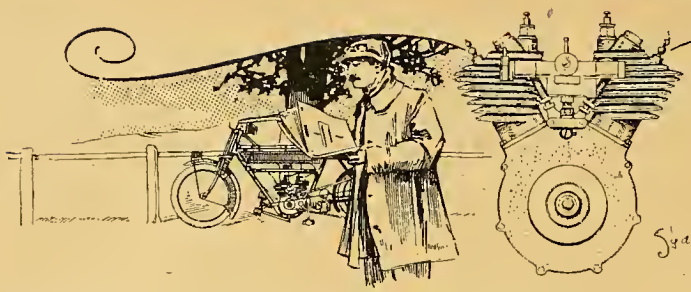
IRELAND SINGLE AND TWIN MACHINES. (See page 672.)

Twin-cylinder Ireland fitted with Blumfield engine. A 4 h.p. single-cylinder Ireland machine.

THE GLOVER CYCLECAR.



WE have already illustrated the experimental cyclecar built by Glover Bros., and we are now able to illustrate the first of the Glover cyclecars completed for the market. The machine has been altered in detail and much improved in appearance, though the general principle is the same as that described in *The Motor Cycle* of February 8th last. A 4¼ h.p. single-cylinder Precision engine, fitted with an Amac carburetter, supplies the motive power, which is transmitted to the counter-shaft by a broad flat belt. The counter-shaft has been considerably altered, and is now carried on ball bearings between two stout tubular members, the upper of which is pivoted to the frame. By means of this device the V and flat belts pull against one another, and thus adjustment is simplified. One inch Service belts transmit the drive from counter-shaft to the rear wheels.



Front view of the Glover cyclecar, showing engine and flat belt drive.

The body is pivoted at the front and carried on a wooden cross-member towards the rear, thus allowing free play to the ash frame. Adjustable pulleys are fitted on both high and low gear sides of the counter-shaft, giving a wide variation of gears. On the occasion of our trial run the gears were 4⅛ to 1 and 7½ to 1. Even with this high ratio it was seldom necessary to drop to the low ratio. The change-speed gear is extremely simple, and is actuated by a side lever through the medium of ball bearing belt shifters. A pedal is also fitted which throws the belt on to the loose pulley, and thus gives free engine when required. Both hand and foot brakes act on the belt rims, and have ample gripping surfaces. The springing of this little vehicle is wonderfully good.

The engine is protected from the elements by a projecting cover, but, being exposed to the air on three sides, showed no signs of overheating on our trip. A large expansion chamber and long exhaust pipe effectively silence the engine. The body is finished in lead grey and upholstered in dark blue, giving a smart and serviceable appearance to this interesting little machine. It may be added that the Glover cyclecar is a real motor cycle four-wheeler, and does not pretend to imitate the big car.

Side view of the latest Glover cyclecar, which has a 4¼ h.p. single-cylinder Precision engine.

THE CARE OF A LIGHTWEIGHT.

THE riders of lightweight motor cycles should remember that they are riding a type of machine which will undoubtedly give satisfaction if used carefully and as intended to be used, but if allowed to run in a neglected state for any length of time the engine may never regain its former efficiency.

We all know that efficient lubrication on any motor cycle engine is essential to good running, and minimum cost of repairs and renewals to engine. Now it may seem strange to some that the lubrication of a lightweight engine is at least three times more important than the lubrication of a heavyweight, and the following reasons will no doubt explain why.

A lightweight under average riding conditions is often driven full throttle, for instance, on most hills and when a good stretch of road is met and a fairly high speed can be enjoyed with safety. The lightweight driven at full speed may not exceed 40 m.p.h., but the heavyweight for a similar speed would be run on half throttle. Thus it will be seen that the lightweight is often driven "all out," and, taking into consideration the low gear necessary on a lightweight, one can easily imagine overheating and the necessity for correct lubrication, and, more important still, the right brand of oil.

The Importance of Lubrication.

I could name certain brands of oil that spell ruin to a lightweight engine, and yet are eminently suitable for a heavyweight. The best plan is to use no other oil than that recommended by the makers of the machine, and not to experiment for yourself, as the makers have done that for the rider's benefit. A fairly thick oil of well-known brands will usually be recommended, and more particularly for small twin engines, as a thin oil is soon lost either past the pistons or out of the crank case joints, thereby making a dirty engine. Little, but very often, is the best way to lubricate a lightweight engine, and by adopting this method the engine will keep its efficiency much longer, and may be run all out for a considerable distance without fear of overheating. Several makers of machines fit very small pumps, a pumpful to be given every three miles. The idea is good, but a small pump is a nuisance in winter. A much better plan is to have a larger pump, which may be filled, say, every ten miles or so, and to discharge the contents a little at a time.

That under-lubrication is the cause of half the troubles of a lightweight I am too well aware. I have even seen an engine with a rimy carbon deposit on the flywheels—flywheels, mark you. That particular engine was never the same, even after a complete overhaul and many replacements, in consequence of the totally inadequate lubrication.

A very good plan for lightweight riders to adopt is this. Before setting out on a fairly long run, start the engine on the stand, and lubricate until it just smokes. Then lubricate in the ordinary way, for if an engine smokes you know it has enough; if it does not smoke, you are in a quandary.

Belts and Pulleys.

Another lightweight bugbear is undoubtedly belts, but even this trouble can be greatly minimised by proper attention.

An adjustable pulley is an undoubted advantage, and it may seem surprising that some makes are not fitted with this. The greatest drawback to many types of adjustable pulleys is the hammering they may be subjected to, and the pulley-shaft of a lightweight will not stand rough treatment. For this very reason, one prominent maker does not fit or recommend an adjustable pulley, but, taking into consideration that there are several types of adjustable pulleys on the market that may be quickly adjusted without the use of any tools, there is no reason why a pulley of this type should not be used with success. Choose one with as little width as possible.

The use of an adjustable pulley will enable a ¾in. belt to be used in place of a ⅝in. belt, and the difference will be surprising. I have at present a well-known make ¾in. rubber belt that has done over a thousand miles, and looks good for another thousand, yet a ⅝in. of the same make rarely lasts a thousand.

A new belt on a fixed pulley gives too high a gear generally. Some leather belts I have used have stood up over $\frac{3}{16}$in. above the pulley, the belt being at fault. With an adjustable pulley this obvious defect may be easily remedied.

A Few Final Hints.

Use as flexible a belt as possible. Certain types of belts, although practically everlasting, take considerable power to drive them, and do the engine no good on account of their stiffness and weight: this I have proved conclusively on the road. Another bad feature of a ⅝in. belt is that it slips badly in wet; this trouble is largely overcome by a ¾in. belt. A leather belt is suitable for any road condition, but most makes of ⅝in. leather belts soon stretch, and in the end are very expensive. On the whole, a good rubber belt is to be preferred. That certain belts absorb considerable power is proved by the following. A certain test hill is climbed easily using a light flexible belt; descending, another belt is fitted, and machine fails to reach the top; descending again, original belt is fitted, when hill is again ascended easily.

The belt rim does not require replacing when using a ¾in. belt in place of an original ⅝in., as a belt

The Care of a Lightweight.—

rim readily accommodates a slightly larger belt. A change from a ⅝in. belt to a ¾in. would, I am sure, prove a blessing to riders who have had belt trouble.

Compression taps on some lightweights have a very small bore, and as some lightweight engines require liberal priming to ensure an easy start, the compression taps should be drilled out larger to allow of spirit entering cylinder easily and without waste.

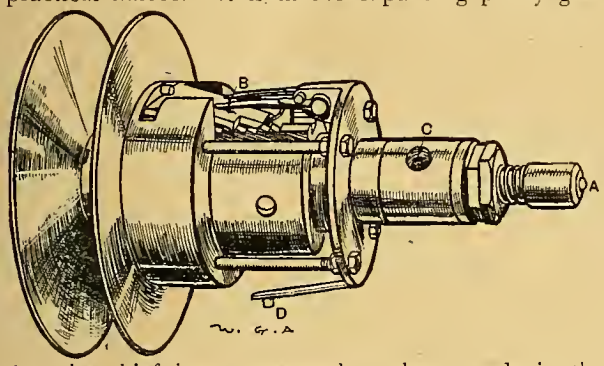
A lightweight is a pleasant machine on which to tour, but do not put a week's baggage on the carrier, as the machine is not intended as a luggage-carrier.

Drain waste oil out of crank case frequently, as it soon gets dirty and useless.

Should the carburetter be of a type you do not understand, do not interfere with it, or you may wish you had not. It may be taken down for cleaning purposes, but let well alone.

Not a few lightweight engines soot the plugs up frequently. This is best cured by using suitable plugs.

Assist the engine when required: a pedal in time often saves nine.



Never fit a very heavy tyre on the back wheel; it is not required. A lightweight is extremely light on tyres, and heavy tyres slow the machine considerably.

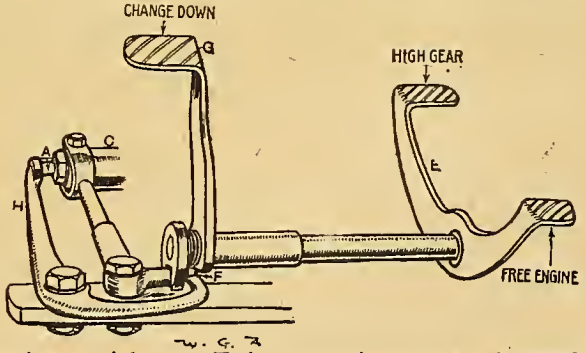
Take the cylinders off and clean pistons of deposit and grind valves before it becomes a real necessity to do so. Engine power is much better than l.p.a.

A lightweight used properly is an economical and enjoyable mount, and the pastime may be enjoyed by those to whom a heavyweight is barred. "PILSI."

Improvements in the Brown Midget Bicar.

WE have on several occasions referred to the ingenuity of Mr. J. T. Brown, of Reading, as regards motor cycle design. His machine, the frame of which is of sheet steel supported by wood, is full of interesting points, and is of a thoroughly practical nature. It is in the expanding pulley gear

that the chief improvements have been made in the Midget Bicar. At the beginning of November last year the prototype of the gear we are about to describe first appeared upon the market, and this was designed to be worked by one lever, which controlled the pulley and took up the slack in the belt by pushing back or pulling forward the rear wheel, by means of a backward and forward movement. The chief objection to this system was that in changing down the pressure of the belt would almost invariably force the gear from top to neutral at once, and the intermediate speeds would be left out altogether. To overcome this difficulty Mr. Brown has slightly altered the method of operation by arranging five separate speeds instead of rendering the gear infinitely variable between two points and using a separate lever to alter the belt tension. Fig. 1 shows the expanding pulley, the degree of opening of which is limited by means of five distinct notches, into which the pawl B engages. This pawl may be released either by pulling on the shaft C or by tapping on the inner shaft A, when the gear is lowered one degree for each tap. D is simply a spring which keeps the dust cap (not shown in the illustration) in its place.



The Controlling Mechanism.

Fig. 2 shows the method of control. The pedal G is responsible for the low gear, and a sharp tap on it with the foot, transmitted through the lever H to the inner shaft A, releases the pawl B (fig. 1) and drops the gear down one notch. Inside the shaft on which this pedal is mounted runs the shaft to which the pedal E is attached, which acts directly on the fork operating the shaft C (fig. 1), by means of which the pawl is held out of engagement from the ratchet during the movement from zero to maximum, or *vice versa*. Pressing this pedal forward works the high gear, which pressure in the reverse direction pulls the pulley open, and low gear is instantly obtained.

The gear ratios obtained are 4, 4¾, 5½, 6¼, and 7 to 1. The advantages of the independent belt tensioning control are obvious, while the fact that the free engine position can be obtained simply by depressing the after heel plate of the rocking pedal E is an excellent point.

On the Road.

While at Mr. Brown's we were given a short demonstration of the working of the gear, which in this case was fitted to a 3½ h.p. Midget bicar to which a sidecar was attached. The machine behaved extremely well on a short steep hill in the vicinity, and the gear at once showed its worth. The first tap brought the gear down the first step and allowed the

engine to pick up. Twice more the gear was lowered, and finally the rest of the hill was taken on second speed. We then took over the driving of the machine, and found the gear quite easy to handle, despite the two pedals and the belt tensioning lever, even in the traffic of Reading, best known for its biscuits and central standards. The gear is really quite sound, and a credit to its designer.

Reliability Trial of the Cape Peninsula M.C.C.

By ARNOLD KEYZER.

AFTER eighteen months of existence the club brought off its first reliability trial on May 16th. The course selected was from Salt River (a suburb three miles distant from Cape Town) *via* Bellville, Somerset West, to the top of Sir Lowry Pass—36½ miles—and back to the starting point.

Competitors had to observe the following average speeds to and from the bottom of the pass: (*a*) Solo machines up to 299 c.c., 16 miles; (*b*) up to 599 c.c., 20 miles; (*c*) up to 1,000 c.c., 24 miles per hour. (*a*) sidecar machines up to 599 c.c., 16 miles; (*b*) up to 1,000 c.c., 20 miles per hour.

Riders ahead or behind their schedule time would lose marks at the following rate: *a*: 8, *b*: 10, and *c*: 12 per minute.

Competitors being allowed watches and speedometers and freedom to stop where it pleased them, it is no small wonder—with the guiding milestones at the roadside—that big losses of marks cannot be recorded.

From Bellville the route led through Knils River with its many good stretches of road, crossing the railway line near Gerste River, through Faure and Firgrove, where again a free crossing of the line was encountered. Hereabouts the belt of W. H. Eastoe's 3½ h.p. Bradbury came off, but was soon replaced.

Half the village seemed present round the control at Somerset-West, where H. S. Olive, who steadily had overtaken the field on his 7 h.p. Indian (he had to maintain a speed of 24 m.p.h.), was one of the first to see his time recorded. He was two minutes behind time, thus losing 24 marks.

A Water-splash to Negotiate.

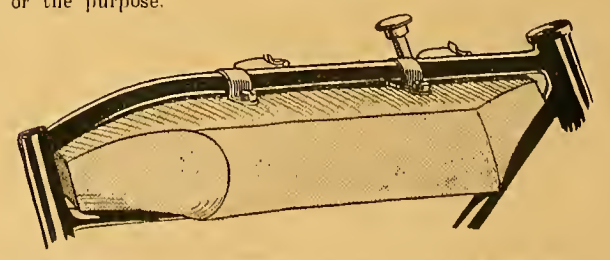
Another four miles over a very hilly road brought the men to the water-splash at the bottom of the pass. Those behind time dashed through the river and were lucky to evade magneto troubles; others made use of the board which serves as a bridge a few yards away. The competitors were timed on the pass, which hill-climb (on formula) formed part of the reliability trial. Had the latter been a non-stop, hot engines might have accounted for many failures in a 3½ miles climb. No one failed to reach the top bar W. Haslam, whose 3½ h.p New Hudson and sidecar, being geared too highly, came to a dead stop near the hairpin bend. J. Brooke (2¾ Douglas) took the water at the bottom and met with immediate magneto trouble; he changed his plugs in vain, and was in difficulty all the way to the top, only one cylinder firing.

To see such expert riders as Douglas (3½ Triumph) and Thornton (3½ Bradbury) taking the hairpin bend was to many an eye-opener in the art of cornering.

Olive (7 Indian) came up with a tremendous pace but cut out at the bends. He made the fastest ascent in 6m. 4⅗s. W. H. Logeman (3½ Humber) did very well in his initial competition.

The Hottentot Holland Mountains, over which the pass rises, are well-known for their scenery. Far below one watches in the hazy distance the glittering surface of the ocean—motionless on this still day—reflecting the rays of the sun. Nearer by, far below in the deep, a road winds its way through pasture lands, where homesteads speak of the farmer's life, where cattle graze, and horse, mule, and ox supply the labour for the tilling and the ploughing of the soil.

On the return journey many took the water-splash in daring fashion. Through the control at Somerset West the riders went along without any incident, only T. C. L. Smith's 2¾ h.p. Torpedo-Precision came to a stop at Gerste River through the breaking of the exhaust valve; the inserting of a spare one and the rider's subsequent sprinting saw him without loss of marks at the Bellville control.



As a club run and subsequent hill-climb the day might have been called a great success; as a reliability trial the writer opines that the factor of reliability, in the sense it is understood in other motor cycling centres, has been conspicuous by its absence.

The maximum number of points to be gained was: For reliability 2,200, hill-climb 400. Result:

Competitor.	Cyl. Capacity.	Marks for Reliability.	Marks for Hill-climb.	Total Marks.	Time Ascending the Pass.

IRELAND SINGLE AND TWIN MACHINES.

A VERY sensibly designed motor cycle is being built by Ireland's Garage, Cleveland Road, Wolverhampton. Three models are constructed, a 3½ h.p. 80×90 mm. single, a 4 h.p. 67×83 mm. twin, and a 5·6 h.p. 67×90 mm. twin. In each case the Blumfield engine is used, and is giving great satisfaction. The frame is on standard lines with a dropped top tube which sweeps down neatly to the line of the back stays. The Bosch magneto is handle-bar controlled, and a B. and B. carburetter is fitted. Saxon spring forks are supplied and the standard finish is in blue with a gold lining giving the machine a very smart appearance. The tank is rounded off at the sides and cut away at the rear so as not to chafe the legs, and the front mudguard has side flaps extending its full length, which very important point we fully appreciated when we came to have a trial run, as it was raining at the time and the roads were in a shocking state. We tried both the 3½ h.p. single and the 4 h.p. twin on the road and found them particularly comfortable. The twin emitted a soft purr and its pick up was wonderful, yet no vibration was felt, although we reached a fair speed on a deserted road. The single has the healthy kick of a moderately high compression engine, though we were absolutely unable to make it knock even running slowly in traffic on a high gear after a warm up in the country. Mr. Ireland does a large amount of motor cycle repair work, and has a well equipped shop for the purpose.

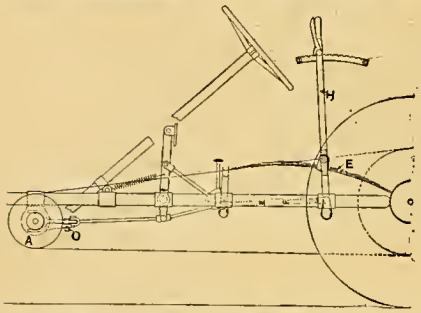
The Ireland tank, which is rounded at the sides and cut away at the rear.

FIRST RELIABILITY TRIAL AT THE CAPE (See opposite page).

(1) W. H. Eastoe (Bradbury) leads the competitors in the descent of the mountain pass.

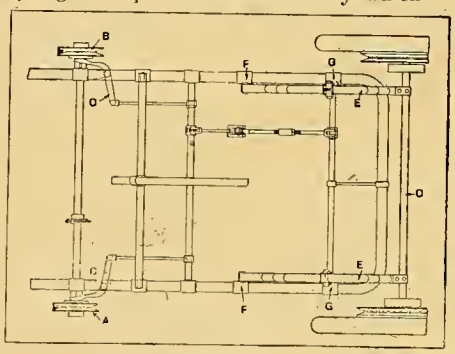
(2) H. S. Olive (7 h.p. Indian) nearing the top of the pass. The grand scenery in these parts will be noticed from the photographs.

(3) Group of competitors at the luncheon stop.



(4) The winner, A. Douglas (3½ h.p. Triumph) negotiating the last bend on the pass in good style.

(5) T. Widdowson (Clyno sidecar) dashing through the watersplash on the homeward journey.

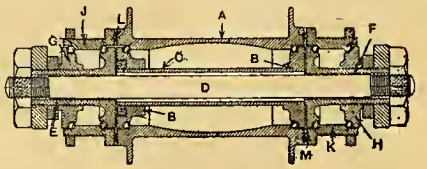


(6) C. E. Scott (Rudge) churning the water at the same point.

The Rollo Transmission.

Variation of gear is effected by the employment of the adjustable belt pulleys A B, which are operated by lever mechanism C. Belt slack is

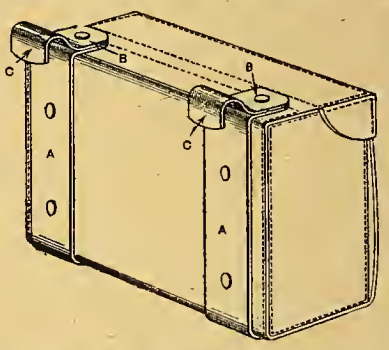
compensated by moving the back axle D, which is mounted upon springs E, carried by sliding members F G. Upon one spring E is pivoted a lever H by which



PATENTS by Eric W. Walford A.C.I.P.A.

the axle is moved and this lever is also connected to the pulley operating mechanism C, so that the pulleys A B and rear axle D work in unison. Various detail features of this gear are described in the specification.—J. D. Rowland, and Warne, Wright and Rowland, Ltd., No. 14,313, 1911.

A Detachable Wheel.



By this invention it is possible to remove the central wheel-carrying part of the hub from the frame, leaving the

pedalling free-wheel and engine pulley-carrying members in place. The hub barrel A is mounted upon ball bearings B on a sleeve C, through which passes the usual fixed spindle D. Around the spindle D, on either side of the barrel B, are mounted sleeves E F, these sleeves being secured in the fork ends, and carrying ball bearings G H, upon which run supplementary hubs J K, adapted to carry the free-wheel and belt pulley respectively. The hubs J K are provided with dog clutches at L M, engaging corresponding clutches on the barrel A. To remove the wheel the spindle D is removed. This allows the forks to spring open, disengaging the dog clutches L M, and allowing the barrel A to fall clear, the supplementary hubs J K remaining in place together with the driving members carried by them.—J. M. Lamb, No. 17,241, 1911.

Toolbag Attachment.

With a view of affording better support to toolbags which are hung on the side of the carrier, the metal strips A, instead of merely running along the side

of the bag, are turned over as at B, and then turned back upon themselves to form the hooks C.—E. Lycett, No. 17,865, 1911.

Sidecar Mats.

Brown Bros. are marketing a cocoanut fibre mat, fourteen inches square, and made specially thick. This is a comfortable addition to the sidecar.

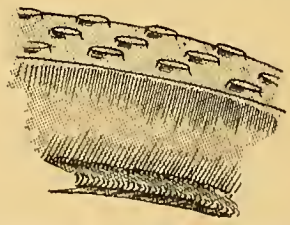
Free Garages.

H. Holt and Co., 68a, Regent Street, Leamington, have made arrangements whereby they are now offering free garage to all motor cyclists.

Cyclecars of 1912.

Readers who desire to compare the different types of cyclecar now on the market, can obtain a list of these vehicles from Harrods, Ltd., Brompton Road, S.W., who have organised a special cyclecar department.

A Good Insurance Scheme.



A new A.C.U. insurance policy, known as the Union Unlimited Policy, is issued by special arrangement with the Liverpool Victoria Insurance Corporation, Ltd. The premiums are divided up according to the horse-power, and are based on the total value of the machine and accessories. Contrary to most other policies, it covers claims arising whilst the insured is taking part in any event run under the A.C.U. rules, such as hill-climbs, reliability trials, consumption tests, and speed-judging, but excludes actual racing. The leaflet setting forth this policy has been got out by Mr. A. H. Priestley, insurance manager of the A.C.U., and Mr. T. W. Loughborough, the secretary. Anyone who takes out one of these policies becomes a touring member of the A.C.U. without extra payment.

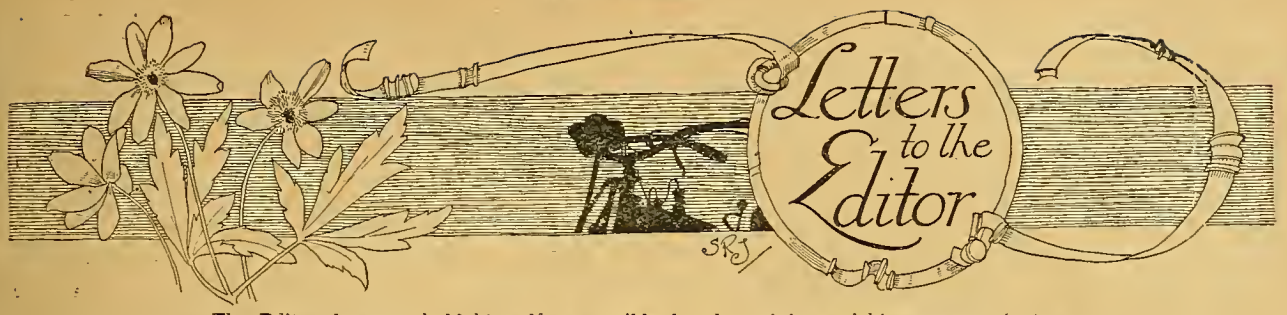
SPARKLETS

A Good Belt.

At the request of the Roberts Motor Tyre Co. we have been testing a Roberts rubber and canvas belt on one of our machines, and it has behaved splendidly. The belt is flexible and even when quite slack it appears to grip sufficiently to transmit the power of a 2¾ h.p. twin. There are no cracks on the surface of the belt, which is a common fault, and the fastener ends of the belt are not bared of their rubber, which is a familiar sight on most machines. Roberts belts are sold by the Roberts Motor Tyre Co., of Gripwell Works, St. Mary's Row, Birmingham.

The new Englebert rubber studded cover with beaded edge, which is being sold by Englebert Tyres Ltd., 200, Great Portland Street, W.

Hill-climbing.



Returning from Edinburgh, J. Chater-Lea, jun., journeyed *via* the Lake District, taking the opportunity to visit some of the famous test hills, including Red Bank, Grasmere, and Kirkstone Pass. These hills were climbed successfully on standard gears, viz., 3⅞ to 1 top, 5¾ to 1 second, and 8¾ to 1 low, with heavy sidecar, passenger, and touring outfit, and after the machine had been run some 600 miles without adjustment.

Strength of Sidecar Axles.

One of the sidecar gold medallists in the London-Edinburgh Run, A. Sudfeldt, used a Millford-Cabrio, and during the journey the wheel of a passing van struck the axle of the sidecar wheel. Examination afterwards proved that only the mudguard was bent, which is a striking testimony to the strength and reliability of Mills-Fulford sidecars.

A Useful Pocket Book.

"The Autocar Log Book," obtainable from Chas. Letts and Co., Southwark Bridge Buildings, S.E., and *The Autocar*, 20, Tudor-Street, E.C., is a most useful pocket book both for the automobilist and motor cyclist. It contains a host of information, not the least useful being a table showing the speed per hour and the time for a furlong, quarter, half or one mile, which is most useful for checking the alleged speeds over measured distances. There is a chapter on motor car law, a chart showing at a glance the weekly mileage run, a list of towns and their hotels and repairers, a cost of maintenance table, a mileage register, and also a record for tours.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Hub and Counter-shaft Gears.

Sir,—With reference to "Ixion's" article in your issue of June 6th, why complicate a hub gear by incorporating the clutch in the hub? The place for a clutch, if not on the engine-shaft, is on the counter-shaft, where it can be made of ample strength for the work required of it, and where a kick starter can be easily fitted. This would dispense with another relic of the pedal bicycle, viz., the pedalling chain. The drive from the counter-shaft could then be by either chain or belt. A.G.

Sir,—Referring to the letter from the James Cycle Co., Ltd., in which they sum up the imperfect points in motor cycle hub gears:

"(1.) The restricted space in which they have to be carried entails the lightest possible form of construction, with consequence of occasional breakages.

(2.) The clutch working at slow speeds is usually very little over its work, consequently clutch slip is not rare.

(3.) Extra weight in the back wheel must slow the machine, and always interferes with the comfort of riding owing to the increase in road vibration from the back wheel. A heavy back is also productive of side-slip."

The best reply we can give to the James Cycle Co., Ltd., is that in the Junior T.T. Race last year, machines fitted with the Armstrong gear were first, second, third, and fourth.

THE ARMSTRONG TRIPLEX THREE-SPEED CO., LTD.

The Trade and the T.T.

Sir,—We think that everyone connected with the motor cycle industry should do whatever they can to keep up the wave of enthusiasm which is now being shown for motor cycling generally. A good deal of the interest in the pastime comes from having something to do and somewhere to go to, and therefore competitions and reliability trials, etc., serve a very good purpose.

As many of the manufacturers have this year decided not to support the T.T. races, may we appeal to some of the larger and more influential motor cycle agents that they themselves should enter a rider for these races?

We ourselves thought of sending a donation to the A.C.U. fund, but decided that perhaps it would serve the trade and pastime better if we entered a rider, and this we have done in the person of S. L. Bailey, who, it will be remembered, on his first ride with the Douglas machine which we supplied to him, put up the phenomenal feat of riding over fifty-six miles in the hour.

It may savour of impudence, but we have also entered Mr. Bailey on a 2¾ h.p. Douglas to ride in the Senior T.T. Race. This, we think, will provide a valuable lesson, and the comparison of the speeds of the machines will no doubt prove very interesting.

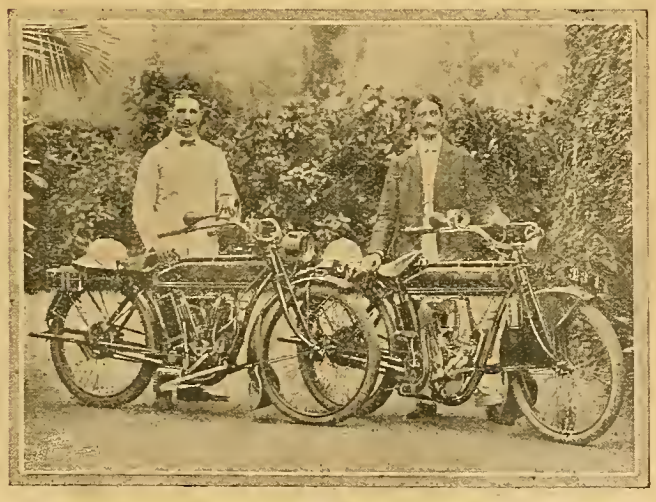
Another suggestion we have to make is that the more important clubs, who are all units of the A.C.U., should themselves be responsible for entering a rider in the T.T. Race; that each club vote from their fund, or subscribe voluntarily from among their members, a sufficient sum to enter one of their members in the T.T. Race. They could pick the best man, pay his expenses, and no doubt the A.C.U. could make a rule to fit the case.

THE COLMORE MOTOR CYCLE DEPOT.

[The above suggestion is an excellent one. It may interest the writer of the above letter to know that in 1907 the Coventry and Warwickshire Motor Club entered a member for the T.T. Race.—ED.]

Salisbury to Exeter.

Sir,—As one who has traversed the main roads in Devon and Somerset with great frequency, I should like to reply to the letter by "Wessex" on "Salisbury to Exeter" a recent issue, and strongly advise readers not to take the route suggested. I am entirely with your correspondent as far as Sparkford, but thereafter should suggest Ilchester, Ilminster, Ham, Honiton, and Exeter. This road is generally in splendid condition, and has no really bad hills; the scenery is also good. The only objection worth notice is the twisty nature of the route through Ilminster. It is also one of the most direct roads.



As regards "Wessex's" route, the road between Langport and Taunton is often poor, and thence to Exeter is uninteresting. There is a steep hill going either way near Wellington, and the surface through the town, especially in the wet, better left unexpressed. Between this town and Cullompton there is generally a lot of traction engine traffic which ruins the road, and the surface of it through Cullompton is regularly such as would disgrace a by-lane. In wet weather too, the grease from Cullompton to Exeter is truly appalling. I often go miles out of my way to avoid this. By Ilminster and Honiton the surface is flint, which is never greasy, interspersed with stretches of tar; the road is also wide and for the most part straight. T 585

The Motor Cycle in India.

Sir,—Enclosed please find a photograph of two Indian cycles, which are thriving exceedingly well in India. One is a 5 h.p. twin, and the other a 4 h.p. single (1911 models).

There is a good number of motor bicycles here now, and they are steadily increasing, but unfortunately there are no organised clubs or competitions of any kind. Triumphs and Rudges are mostly in evidence, but there are also Douglas, Enfield, Rover, Singer, Bat, Indian, Rex, Bradbury, F.N., and N.S.U. motor cycles on the road here.

Calcutta. K. EDMARK.

Calcutta riders of Indian motor cycles. Illustration referred to by K. Edmark in his letter on this page.

The Problem of the Automatic Carburetter.

Sir,—*Re* automatic carburetters, no mention has yet been made of the N.S.U. 1912 standard, as fitted to all their machines. This is a very good carburetter, and very flexible, but does not develop the power expected. So for experiment (and thanks to your suggestion) I had the Bowden extra air inlet fitted behind, and parallel with, the gas throttle. The improvement is immense, so much so that I feel other N.S.U. riders ought to know. It may or may not equal the power obtained from a B. and B., but it is a comparatively inexpensive fitment, well worth adopting. I am sorry to hear that the company is not prepared to supply the extra-heavy N.S.U. two-speed gear; this knowledge will doubtless be disappointing to many besides myself. HEILBRONN.

Holyhead Road.

Sir,—Readers will be interested to know that the road between Corwen and Cerry-y-Druidion is being well repaired, and should soon be in good condition. A few places are now covered with loose metal, and some corners require careful negotiating, but the road has good surface elsewhere.

At Conway Bridge, whoever wishes to view the river before passing over must keep one eye on the machine. I was fortunate to spy my James and sidecar being wheeled over to Conway. Chasing the purloiner (who turned out to be the toll-collector, not in uniform), I strongly protested, and demanded an explanation, and called a police officer. They informed me that because we were on Bridge property, and had not yet arrived at the tollgate, the collector had a right, in my absence, to arrest my machine to prevent us going away without paying the 3d. toll, which had not been demanded, and I was unaware that it would be required until the bridge had been crossed, no notice being seen to that effect

W.H.E.

Should Ladies Race?

Sir,—As one of the lady motor cyclists who does race, I think this matter should be left entirely to us. Any sporting club who has a ladies' class may be sure of my support (club secretaries, please note). We are not going to be frightened just because one or two of our number have had one or two falls. We have quite as much pluck, judgment, and nerve as you men.

(Mrs.) KATHLEEN H. SIMPSON.

Sir,—I cannot help thinking that Miss Walker is doing a grave injustice to the memory of the original Mr. Stiggins when she implies that the author of your leaderette on the desirability of allowing ladies to race is a fit and proper person to perpetuate his name and opinions. Surely it would grieve that well-meaning if mistaken gentleman to think that his name was associated with an article which strongly advocates reliability trials for ladies, particularly as that article appears in a journal which for the last six or seven years has always been ready and willing to give publicity to their successes as motor cyclists. Then fancy likening trial riding to perambulator pushing. Surely she knows, as a sportswoman, that the modern motor cycle requires to be driven rather than led.

In conclusion, I note that several ladies have written to you on this subject. Some of them are famous in the motor cycling world; very nearly all of them are well-known. They all disagree with your leaderette, but Miss Walker is the only one who has taken offence at it, and who has seen fit to call its author names. D. S. HOLMES.

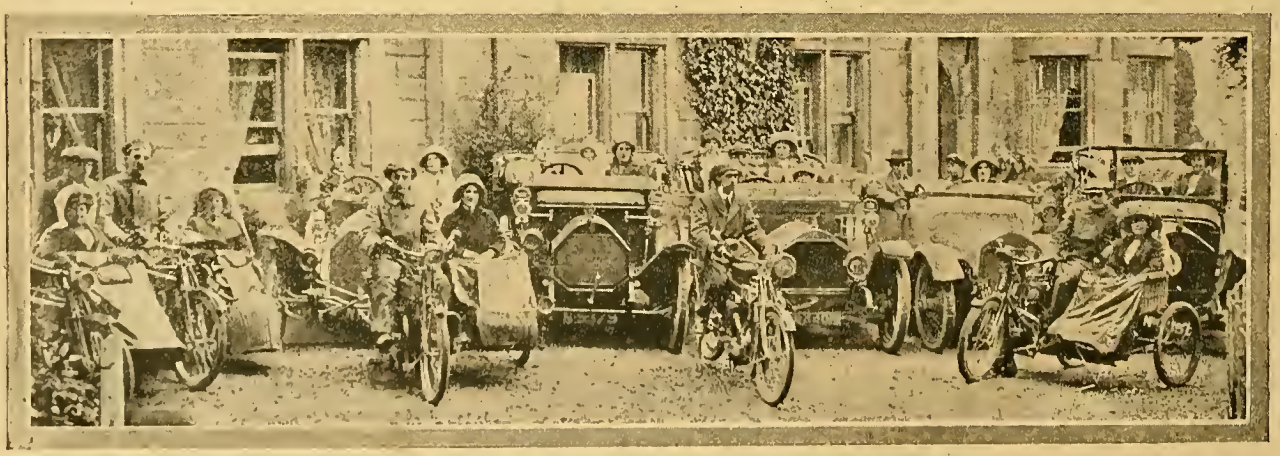
Speedometers and Wheel Sizes.

Sir,—Is it not time that speedometer manufacturers realised the fact that the actual size of a tyre is less than the nominal size? My Cowey, which is an excellent instrument in other respects, was three per cent. fast last year with an Avon 26in. × 2in. tyre, and is nearly seven per cent. fast this year with a Palmer 26in. × 2½in. tyre. The error increases as the studs wear down, and I suggest that the makers should gear their instruments for a wheel about five per cent. smaller than the nominal size.

Ten years ago this matter was taken up with the Veeder Co., when it was found that a 27½in. Veeder cyclometer was more accurate than the standard 28in. size. After the matter was ventilated, the Veeder Co. geared their cyclometers for a smaller wheel. C. R. WOOLLEY.

The Danger of Uncontrolled Dogs.

Sir,—In reference to the correspondence regarding dangerous dogs. The exact reading of the law on this subject is: "It must be proved that the owner of a dog knows of its propensities." There you have the whole situation in a nutshell. I have studied the law as regards dogs carefully, and decisions from time to time in reference to the subject. You may know that a dog is a public danger. The police may know also, but unless you can prove the owner knows there is no redress. There is only one way out of the difficulty, and that is by means of "The Dogs' Black List," an idea instituted about two years ago, and which has only just lately struck road users as being a step in the right direction.



If any cyclist, or motor cyclist, who is attacked by a dog (the dog may not necessarily be vicious to be dangerous) will report the matter to me, and let me have a description of the dog and full name and address of the owner, I will take the necessary steps.

On a dog being reported full details are entered in the Dogs' Black List, a registered letter is sent to the owner, and the local police also asked officially to warn the owner. Should this dog offend again it is a simple matter to prove the owner knows of his dog's propensities.

If it is not possible to prove that an owner knows of his dog's propensities for running at or attacking cyclists or motor cyclists, it is a sheer waste of money, as the law at present stands, to take legal action.

Would you, therefore, in the interests of your numerous readers insert this letter on the subject in your next issue. I may add that under no circumstances is the name of the informer betrayed.

RELIABLE ACCESSORIES AT LONDON'S LOWEST PRICES

The Hunt North Road Overall Leggings.

Manufactured of Double Texture Fawn Waterproof Paramatta. Worn over the ordinary trousers, fastening round waist with leather strap and buckle. The construction affords great protection to the stomach. Impossible for rain dust and dirt to drive in on the rider's trousers as with the ordinary leggings. Strengthened at fork, spat feet, fastening at side with patent clips.

Stocked in three sizes, *i.e.*,
No 1. Men's, length over all 43ins., inside leg 31ins.
No. 2. Men's, length over all 45ins., inside leg 33ins.
No. 3. Men's, length over all 47ins., inside leg 35ins.

Price, quality No. 1, 16/6 per pair, postage 6d.
Price, quality No. 2, 13/6 per pair, postage 6d.

THE "ALL-WEATHER" SUIT.

A Reliable Outfit at a Popular Price.

Manufactured in double texture fawn water-proof material. Coat, double-breasted, wind and rain cuffs, storm collar, throat tab, ventilated under arms, two side pockets with flaps. Leggings manufactured of the same material to match, with straps for attaching to brace buttons, spat feet. Stock sizes: Coat, length 36in., chest 40, 42, 44in. (size taken over coat) Leggings, full length 34in., length inside leg 29in.

Price of suit complete £1 5 0.
Coat only .. £0 17 6
Leggings only 0 7 6

In answering these advertisements is desirable to mention "The Motor Cycle."

Succombes Hill, near Caterham.

Sir,—I notice from last week's issue that Succombes Hill has just been re-discovered and climbed by a T.T. Douglas.

I think most of the riders in this neighbourhood have been up it at some time or another; Mr. E. M. Oliver climbed it on a Triumph several years ago, when I had the pleasure of photographing him in flight, which photograph was reproduced in *The Motor Cycle*. I myself was successful on a 2½ A.J.S. a few weeks ago. On the top bend, where the gradient is about 1 in 4 (I don't believe it is 1 in 3), there is a track about a foot wide in rideable condition, the rest being loose flints. But for the surface, Succombes would not offer much difficulty to a good modern machine, as it could be rushed easily but for the need for caution.

My first shot at the hill failed solely because I ran among these stones, then on to the footpath, and off again amongst the stones; after which I judged it time to shut off!

SYDNEY J. TAYLER,
Hon. Sec. Purley and District M.C.C.

Dangerous Driving.

Sir,—In reply to a letter signed "Within the Twenty-mile Limit," in your issue of June 13th, it is such riders as the writer of this letter, and such letters and complaints generally, which, to my mind, somewhat spoil the sport of motor cycling. I own a 1912 P. and M. on which I rode from Barnsley to Manchester on the Saturday immediately preceding Whit-Sunday, and from Manchester to Llandudno *viâ* Chester, and it is on that part of the road of which your correspondent complains, namely, Northwich to Chester, that I am summoned for driving to the danger of the public and for exceeding the speed limit by 6⅔ m.p.h., viz., 26⅔ m.p.h. In the first place the road is more than conducive to fast riding, but it may interest your readers to know that it is now possible to pull a machine up in a very few yards and also to pick up very quickly, and unless he was actually at the "blind" part of the corner he would not perceive the slowing of a machine. On the Saturday above mentioned the only traffic was motor traffic, and all, without exception, going in the same southerly direction.

I shall be glad if you will publish this letter as a reminder to other riders that Cheshire is still a very dangerous county. C 5546.

The M.C.C. London-Edinburgh Run.

Sir,—In connection with this year's awards there seems to be some misunderstanding as to the error from schedule of the various cup winners. It should be explained that the various winners' times given as 0 or zero meant that that particular competitor had made the least error from schedule. It seems to be popularly supposed that the competitors credited with 0 or zero did not make a second's error from schedule—a thing which is obviously impossible to anyone who has the most elementary knowledge of running to time.

I understand that the winners' times were not published to avoid any bickering over the awards, but from what I hear this arrangement has had quite the contrary effect. It seems to me in common fairness to those who were close up to the winners in this arduous trial that the winners' times should be published. What does the committee say?

SIXTY-FIVE SECONDS.

[With reference to the above letter, we have received an official intimation from the trials hon. secretary, Mr. Harry G. Bell, that in connection with the winners of the M.C.C. Cup and Clark and Wells Cups, the zero marks were only used to represent the best performances, as it was obviously almost impossible for anyone to accomplish the distance from London to Edinburgh and back without losing some time at the many checking places on the route. In the aggregate, the better of the two winners made an error of several minutes.—ED.]

Petrol Consumption.

Sir,—I have read your editorial remarks and the various letters from your readers in reply to my first communication, and I am afraid they are not very helpful. I only referred to the up-to-date 3½ h.p. machine, and I notice there are only six letters from riders of such a motor cycle, and their average consumption works out at a little over ninety miles per gallon. I further observe that you state that 100 m.p.g. is "not uncommon," which is a very different thing from being customary. I can only state that I take every opportunity of consulting riders on this important point, and from the information thus gathered, I am satisfied that the ordinary rider does not average over 80 m.p.g. I should be very pleased to obtain that result.

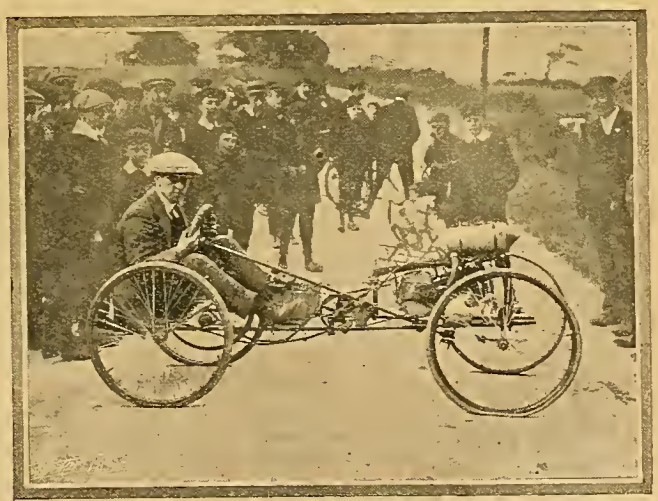
The knowledge that would be of benefit to myself, and no doubt many other riders, would be that from experienced riders who can give definite information as to how consumption is affected by gear ratio, patent jets, fans in the induction pipe, special arrangements of air tubes, and other economisers. Doubtless there are many who can give such experiences, which would be very useful to that large body of riders who have hitherto failed to obtain the desired result in the way of mileage to the gallon. ENQUIRER.

The Price of Petrol.

Sir,—At the Conference on the petrol supply, held at the Royal Automobile Club, a speaker, dealing with the present high prices of petrol, said that retailers all over the country had been robbing motorists during the past two months by charging from 2s. to 5s. per gallon. The same speaker pertinently enquired why, if there were directions in which retailers were controlled, they should not in like manner be prevented from sending the price of petrol up an unlimited scale?

The obvious reply (which, clear enough to those in the trade, is not so clear to others) is that organisations of weight and power are so extremely busy in keeping prices up, that they have no time (even if they have the inclination) to do the other thing, and protect the consumer from extortionate prices.

It will be within the memory of all that Gamages suffered the extreme punishment of expulsion from the leading motor society for selling a certain proprietary tyre under the list price. This being possible, can the public expect any such body to be interested in keeping down the prices of motor necessities? The remedy is in the hands of the consumers themselves. If they will only refuse to buy price-maintained articles, and will only do business with those houses which have always endeavoured to serve them well, even to the point of fighting manufacturers in the courts of law, they will soon find that such an inflated price as that of petrol will be impossible. A. W. GAMAGE, LTD.



SUMMARY OF CORRESPONDENCE.

Will J. Summers send his full postal address to the Editor, as two or three communications are waiting for him?

Will G. Wakefield, who recently wrote to the A.A. and M.U., send his full postal address to the secretary?

Readers who have constructed their own cyclecars are requested to communicate with L. V. James, c/o the Editor.

We are asked to state that the letter signed Sydney R. Axford and published on page 647 of last issue had been unavoidably held over, and was a reply to Alex Rogers, whose letter was published a few weeks previously. In consequence the introduction was slightly amended.—ED.

A PUSHCYCLECAR. A real spider quad built by the driver, W. Garsides, of Brombledene, Pontefract. Bicycle tyres had been fitted but none were left after the Pontefract hill climb. The power is supplied by a 2¾ h.p. M.M.C. engine.

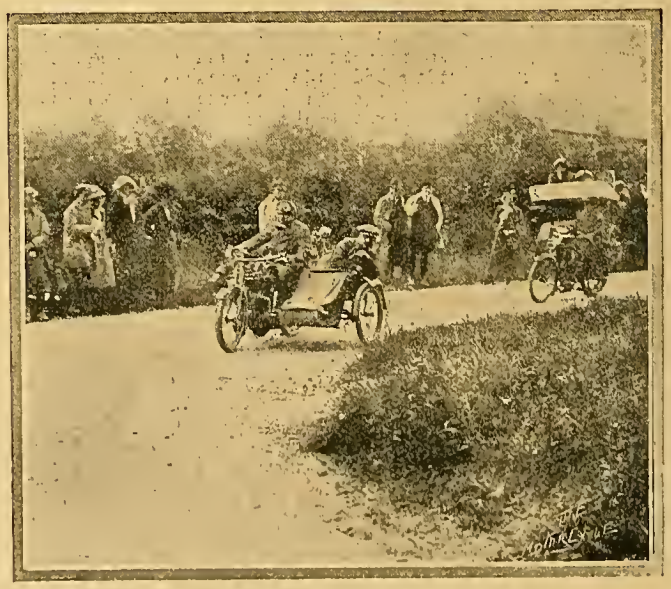
M.C.C. TEAM TRIAL FOR

"THE MOTOR CYCLE" CHALLENGE CUP

THERE was probably the biggest assembly of motor cyclists ever gathered together in England at the ninth inter-club team trial for *The Motor Cycle* 50 guinea challenge cup, which took place on Saturday last. With twenty-five teams taking part, representing 150 riders, and the big majority of the teams being accompanied by reserve men and supporters, the impressiveness of the sight of such a long line of motor cyclists can be imagined. Daventry (Northants) was the meeting point, the Motor Cycling Club's headquarters being at the Wheatsheaf Hotel. All roads led to Daventry on Saturday, and from early morning competitors began to arrive from such distant points as Sheffield, Yarmouth, Liverpool, Manchester, and Bristol. Naturally, the hotel accommodation was taxed to the utmost. It would appear that one of the reasons for the early assembly at Daventry was the belief that Newnham Hill would be included in the secret course, for nearly all morning practising was in progress on this noted acclivity.

The Club Championship.

The M.C.C. team trial carries with it the club championship, for the team trial organised by the A.C.U. the last two years was abandoned. There was never any doubt about the popularity of the M.C.C. trial, and a *résumé* of the results during the last nine years may be of interest. The cup-holders to date have been:



1904.—Coventry M.C.C.
1905.—M.C.C. walked over.
1906.—M.C.C.
1907.—Coventry M.C.
1908.—Coventry M.C. won old trophy outright.
1909.—M.C.C.
1910.—Coventry and Warwickshire M.C.
1911.—Derby and District M.C.C.
1912.—Nottingham and District M.C.C.

It was not until 1909 that a complete team of six finished the 100 miles course without a stop, but ever since that date the number of non-stop teams has increased, which, in view of the progress made in motor cycle construction, will cause no surprise.

Praiseworthy Organisation.

The start was at 1 p.m., and here we should interpose with a remark regarding the excellent organisation. The M.C.C. have had sufficient experience of the organisation of big events to ensure a trial passing off smoothly. For a long stretch before the starting point the positions of the clubs were clearly defined by cards on the grass by the roadside, and as every competitor had had a programme giving the starting times, there was a total absence of confusion. Numbers for the machines had been doled out by Mr. F. J. Jenkins, the trials hon. sec., an hour before the start. Just before 1 p.m. the chief marshal, Mr. R. H. Head, marshalled the men, and exactly at 1 p.m. Mr. F. T. Bidlake, the timekeeper, sent them off at intervals of twenty seconds.

The teams were despatched in alphabetical order according to the name of the club, the cup-holders, the Derby and District M.C.C., having pride of place. Only one team scratched, the Streatham and District M.C.C. Five complete teams had been got away before there was an incident to record, the Coventry and Warwickshire M.C.—the most successful club in the contest—losing a man at the start. H. Williamson, driving an 8 h.p. sidecar of that name, was unable to get away on being given the word to start, despite two attempts, and it was subsequently found that it was due to a broken clutch spring. The Coventry Club had two reserve sidecars at hand, but as Williamson had crossed the starting line he could not be withdrawn. This club, therefore, had virtually five representatives, who all made non-stops. F. C. Jones (Mersey M.C.) was unlucky at the start. His Bradbury had a choked carburetter jet, and he failed to get going. He returned to the start, and was allowed another attempt, but again the engine would not fire, and he appealed to the judges, pointing out that he should have been allowed two minutes. The rule, however, is that "a fresh start will be allowed any competitor returning

A. E. Lole (8 h.p. Campion-Jap sidecar), of the winning team, rounding the right angle bend near the starting point.

The tea stop on the third round.

to the starting point within two minutes of starting." The judges, Messrs. Brooker, Grew, and Dr. O'Rafferty, therefore decided that a third attempt was not permissible. A choked jet also put P. P. Syvret (Rex), Liverpool, out of the running almost at the start.

The Route.

This year's route started one mile from Daventry on the Banbury Road, and immediately after the start a right turn was taken for Staverton. After this village there was a gradual rise to Shuckburgh, followed by a descent to Southam. Just before the entrance to the village of Southam a lane to the left called Welsh Road led to Priors Hardwick, and a short stiff hill after the fork roads leading to the latter village caught five or six competitors napping. After Priors Hardwick the course followed through Upper Boddington, where a left turn was taken for Byfield, joining the Daventry and Banbury Road at this place. From Byfield to the finish the surface was excellent, the only other hill that called for extra throttle opening being the one at Badby.

We deplore the fact that the course was not more severe, as the contestants would have been weeded out so much more effectually. As it was, the run was a mere jaunt, and the last two rounds somewhat tedious.

Punctures depleted the ranks of many of the teams. R. W. Duke (Zenith), Birmingham M.C.C., was unfortunate in the first six miles, and he was joined by Brook (Precision), secretary of the same club. Further on, Durant (Norton), Sheffield, stopped mysteriously, his machine at once restarting in its usual style. R. C. Davis (Chater-Lea), Oxford, punctured, as also did F. E. Pither (Enfield), North Middlesex, and F. S. Bowles (Indian), Leicester.

Glyn Rowden (Triumph) N.W. London M.C.C. leading competitors down the hill near Badby.

Members of the South Birmingham M.C.C. running regularly. This team finished complete.

M.C.C. Team Trial.—

The passenger machine is usually the weak spot in the team trial, and Saturday's contest was no exception to the rule. No less than six clubs could boast of non-stop runs throughout the motor bicycles, but not so with their passenger machines, which is interesting and instructive reading.

The Derby Club men were anxious to retain possession of the trophy, and set out with machines perfect to the last degree. Unfortunately, two of their men ran off the well marked course, which entailed disqualification.

And so the afternoon progressed, trifling troubles gradually thinning the ranks. The villagers turned out in their hundreds to watch the long line of riders file past, the boys having quite a memorable day throwing their hats at the machines. We saw some of the competitors making a collection of caps, and as a lesson to some of the rascals Sam Wright caught two or three and carried them two complete laps before returning them to the owners. This action had the desired effect.

Several droves of cattle hindered the riders, and a heifer which ran almost wild, and attempted to race one bunch of competitors, helped to vary the monotony.

An Appreciated Change.

This year a change was made in the order of starting the riders. Each team was sent off complete, so that friends rode together, instead of a Bristol man finding himself with a total stranger from Liverpool, for instance, as was the case in previous years. Besides, it was easier to tell how many teams were still in the running, and there was a big crowd of interested motor cyclists watching the proceedings.

Once again a new club scored a success, though seven complete teams recorded non-stops throughout, if we include the Derby and District M.C.C.

The Nottingham men annexed the trophy by regular running, beating the next club by 7m. 1s. There was great jubilation in their ranks when the results were announced the same evening; in fact, they scored a popular win.

Below we give the composition of the six teams of riders who completed the trial with full scores in the order in which they finished.

Winners of "The Motor Cycle" Challenge Cup.

FIRST.—NOTTINGHAM AND DISTRICT M.C.C.

	Time error m. s.
N. O. Soresby (3½ Rudge)	15 11
J. Farnsworth (3½ Rover)	16 54

The following accomplished non-stop runs:

COVENTRY AND WARWICKSHIRE M.C.—A. Elson (3½ Singer). W. F. Newsome (3½ Triumph), A. N. Barrett (3½ Rudge), S. Wright (3½ Humber), and Geoffrey Smith (3½ Rover).

LIVERPOOL AUTO CYCLE CLUB.—N. Brown (7 Indian), W. Heaton (A.J.S.), C. Hobbs (Humber), J. H. Fox (3½ Rudge), and S. W. Philpott (Humber).

LUTON AND SOUTH BEDS. M.C.C.—S. W. Brown (3½ Bradbury), G. Bone (3½ Triumph), C. Dickinson (3½ Rudge), R. P. Terry (3½ New Hudson), R. C. Deacon (3½ Rudge).

NORTHAMPTONSHIRE M.C.C.—A. E. Catt (3½ Triumph), W. Barratt (3½ Rudge), W. Lees (3½ Triumph), H. H. Saddington (3½ James), and C. H. Jolley (3½ Triumph).

OXFORD M.C.C.—H. G. Hill (3½ Bradbury), W. A. Matthews (3½ Triumph), G. F. Cooper (3½ Triumph), H. Askew (3½ Triumph), H. G. R. Slingo (5-6 Clyno and sc.).

SUTTON COLDFIELD AND MID-WARWICKSHIRE A.C.—Seymour Smith (3½ Norton), R. Holloway (3½ Premier), V. Busby (2¾ Humber), T. Pollock (James and sc.), and F. Whitworth (2¾ Douglas).

WOLVERHAMPTON M.C.C.—T. H. Haddock (2½ A.J.S.), Reg. Tonks' (3½ Rudge), G. Hill (3½ Rudge), J. T. Ireland (3½ Ireland), and A. J. Stevens (5 A.J.S. and sc.).

DERBY AND DISTRICT M.C.C.—A. Ainsworth (3½ Rudge), A. B. Bennett (6 Brough), H. Baker (3½ Triumph), and E. Russell (3½ Bradbury).

BIRMINGHAM M.C.C.—A. D. Arter (3½ James), H. Newey (3½ Ariel), W. H. Egginton (3½ New Hudson), and Dr. B. Fawssett (8 Chater-Lea Jap and sc.).

ESSEX MOTOR CLUB.—G. T. Gray (3½ Rudge), H. C. Hemy (3½ Service), J. A. Campbell (3½ Rudge), and A. Hill (7 Indian).

HERTS. COUNTY AUTO AND AERO CLUB.—E. A. Colliver (3½ Zenith), Norman Gutteridge (3½ Rudge), A. H. Colliver (3½ Zenith), and Maurice Down (7 Indian and sc.).

LEICESTER AND DISTRICT M.C.C.—A. L. Barker (3½ Singer), E. Folwell (3½ B.S.A.), E. Nedham (3½ Campion-Jap), —. Yates (3½ Rudge), and Mrs. Simpson (3½ Rudge).

NORFOLK M.C.C.—A. Adcock (5-6 F.N.), E. M. Wood (3 N.S.U.), G. Boswell (3½ Ariel), H. Collins (8 Matchless).

NORTH MIDDLESEX M.C.C.—G. L. Fletcher (2¾ Douglas), C. Q. Roberts (3½ Rover), D. H. Noble (3½ Rover), and H. C. Mills (3½ Premier).

BRISTOL BICYCLE AND MOTOR CLUB.—S. J. Fair (B.S.A.), —. Hinton (Douglas), and L. E. Scammell (Rex).

N.-W. LONDON M.C.C.—E. Rose (3½ P. and M.), Glyn Rowden (3½ Triumph), and W. Cooper (3½ Bradbury).

NORWICH AND DISTRICT M.C.C.—H. Chapman (3½ Triumph), F. Brighty (3 Jap), and G. Pope (3½ Triumph).

SHEFFIELD AND HALLAMSHIRE M.C.C.—J. Haslam (6 Zenith), S. Sawer (3½ Premier), and M. Neill (8 Zenith sc.).

MERSEY MOTOR CLUB.—F. Rees (3½ Rudge), T. Moore (3½ Triumph), and W. E. Smith (6 Zenith sc.)

The five motor bicyclists of the Coventry and Warwickshire M.C. team nearing Staverton. All made non-stop runs.

SAILINGS TO AND FROM THE ISLE OF MAN.

The following table shows the times of sailings between England and the Isle of Man on the more important days of the T.T. Race Week. Particulars of charges for motor cycles on the steamers between Liverpool and Douglas, and *vice versa*, and porters' charges at Douglas, are also included.

FROM LIVERPOOL.	FROM DOUGLAS.
THURSDAY, June 27th: 10.30 a.m., 2.45 p.m., and 12.50 night (a).	THURSDAY, June 27th: 9 a.m. and 4 p.m.
FRIDAY, June 28th: 10.30 a.m., 2.45 p.m., and 12.50 night.	FRIDAY, June 28th: 9 a.m. and 4 p.m.
SATURDAY, June 29th: 10.30 a.m., 2.45 p.m., 5.30 p.m., and 12.50 night.	SATURDAY, June 29th: 9 a.m. and 4 p.m.
MONDAY, July 1st: 1 a.m. (Sunday night), 10.30 a.m., and 2.45 p.m.	MONDAY, July 1st: 12.30 a.m. (Sunday night), 9 a.m., 4 p.m., and 12.30 night.

(a) Cargo and passenger steamer "Douglas" or "Fenella."

On MONDAY, July 1st, there will be an excursion at 1 a.m. (Sunday night), available to return from Douglas same day at 4 p.m. or 12.30 night. Steerage, 4/-; Saloon, 6/-.

FOUR DAYS EXCURSION TICKETS will be issued on FRIDAY, June 28th, by steamers leaving LIVERPOOL at 12.50 a.m. (Thursday night), 10.30 a.m., 2.45 p.m., and 12.50 night; also by Saturday's steamers, available until the following Monday or Tuesday. Steerage, 6/-; Saloon, 9/-.

FLEETWOOD AND DOUGLAS: From Fleetwood, every weekday, 10.30 a.m.; from Douglas, every weekday, 4 p.m. Extra Services: Fridays, Saturdays, and Mondays, commencing June 28th—From Fleetwood, after arrival of through trains due about 3.30 p.m.; from Douglas, 8.30 a.m.

The following charges are made for motor cycles when accompanied by passenger, single journey in each case.

MOTOR BICYCLE, 2/6; with sidecar, 5/-. MOTOR TRICYCLE, 5/-; if more than one seat 2/- per seat extra. Petrol tanks must be emptied before going on board.

PORTERS CHARGES AT DOUGLAS: Motor cycle—for conveying same from steamer's deck to pier, or *vice versa*, each porter, 6d.; for a porter assisting a person in charge thereof by conveying same to the pier, or *vice versa*, 9d.

Midland Railway Service: Daily from June 21st to the 29th. From Heysham 10.0 a.m. and 3.0 p.m. From Douglas 9.30 a.m. and 4.0 p.m.

IMPROVEMENTS TO THE T.T. COURSE.

The Quarter Bridge, which is now about twice as wide as it was last year. The new corner near Mr. Hall Caine's house. The car in the background is on the old part.

CURRENT CHAT

TIME TO LIGHT LAMPS.

June 20th	...	...	9.18 p.m.
,, 22nd	...	...	9.19 ,,
,, 24th	...	...	9.19 ,,
,, 26th	...	...	9.19 ,,

New Saucer Track in America.

A new saucer track banked to an angle of fifty-three degrees instead of the usual fifty degrees will be opened at Coney Island, New York, on Saturday next.

Road Agent's Assistance.

Near Barnet last week-end we saw one of the R.A.C. road guides rendering valuable assistance to a rider of a Douglas motor bicycle. The A.A. and M.U. scouts also helped a competitor in the M.C.C. team trial, who was in sad trouble with his tyres last Saturday on the London-Daventry Road.

A Late Entry.

The holder of the Tourist Trophy, O. C. Godfrey, will defend his title on a twin Indian of 497 c.c. capacity, bore and stroke 70×64.5 mm. It has been reported that he would not ride in the Isle of Man. Godfrey's entry brings the Senior T.T. entries to 49. There are 25 competitors in the Junior race.

An American Trial.

A Six Days' Trade Trial is to be held in the States shortly, and we understand that a Pinkerton detective will guard the machines each night of the trials. The Chicago Motor Cycle Club is the organising body.

Another Successful Ascent of Tow Top.

We are informed that a party of Southport motor cyclists made a journey to Tow Top on the 9th inst. Among those who succeeded in reaching the summit were two riders of Scott machines, Hugh Gibson (3½ Bradbury sidecar, Sturmey Archer gear) and G. Wray (3½ Bradbury sidecar, chain drive, Wray two-speed gear). The two latter had passengers in the sidecars. Mr. Fairhurst (two speed Clyno) had rather hard luck as he stopped on the S bend owing to the back wheel slipping in the loose surface.

French Grand Prix Cancelled.

The A.C.F. have decided to cancel the Grand Prix Road Race, which was to have taken place on the 30th inst. and will replace it by kilometre and mile speed tests in September. These road records will be divided into classes as follow: Single-cylinder motor cycles fitted with engines of 250 c.c., 350 c.c., and 500 c.c. Twin-cylinders, 350 c.c. and 500 c.c. Tricars and sidecars, singles, 350 c.c. and 500 c.c.; twins, 350 c.c. and 500 c.c. Cyclecars, singles, 760 c.c.; twins, 1,004 c.c.

Trip to the Isle of Man.

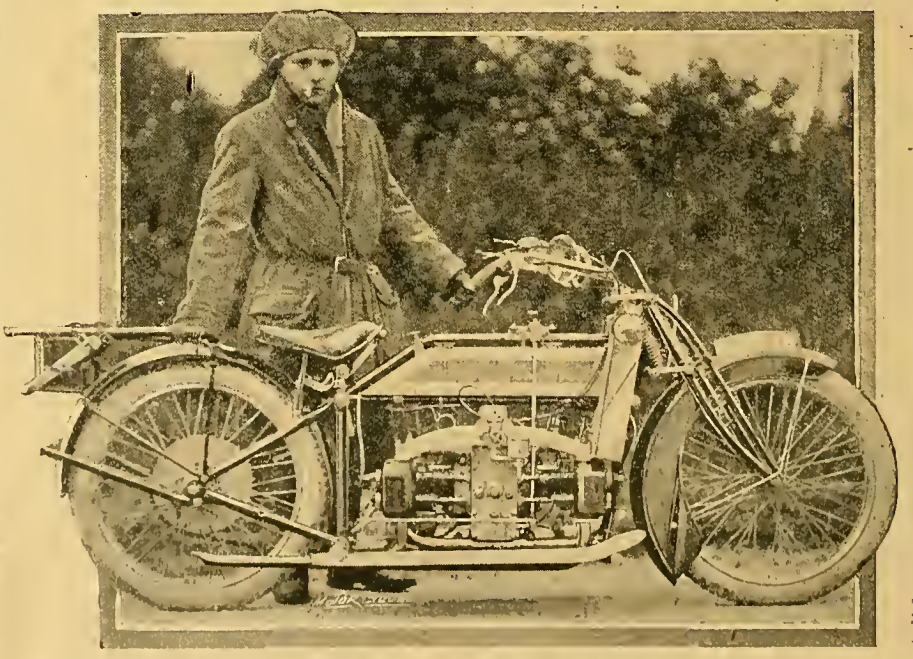
Mr. E. G. Young, Nottingham, who has in previous years organised a party to see the T.T. races, is again making similar preparations, but instead of travelling by rail the party will travel by road, leaving Trent Bridge on Sunday morning, the 30th inst., at 11 a.m., and returning by a convenient boat after the race on Monday, July 1st. The motor cycles will be garaged in Liverpool and picked up again on the return journey. Riders who do not reside in Nottingham will be welcome and should write to Mr. E. G. Young, The Bentinck Motor Co., Trent Bridge, Nottingham.

FUTURE EVENTS

June 28.—JUNIOR TOURIST TROPHY RACE.
July 1.—SENIOR TOURIST TROPHY RACE.
,, 6.—Dublin M.C.C. Open Hill-climb.
,, 15.—Irish Open End-to-end Reliability Trial.
,, 20.—B.M.C.R.C. Race Meeting.
,, 20.—Liverpool A.C.C. Open Speed Trials.
,, 20.—South Wales A.C., and Cardiff M.C.C. Open Speed Trials at Porthcawl.

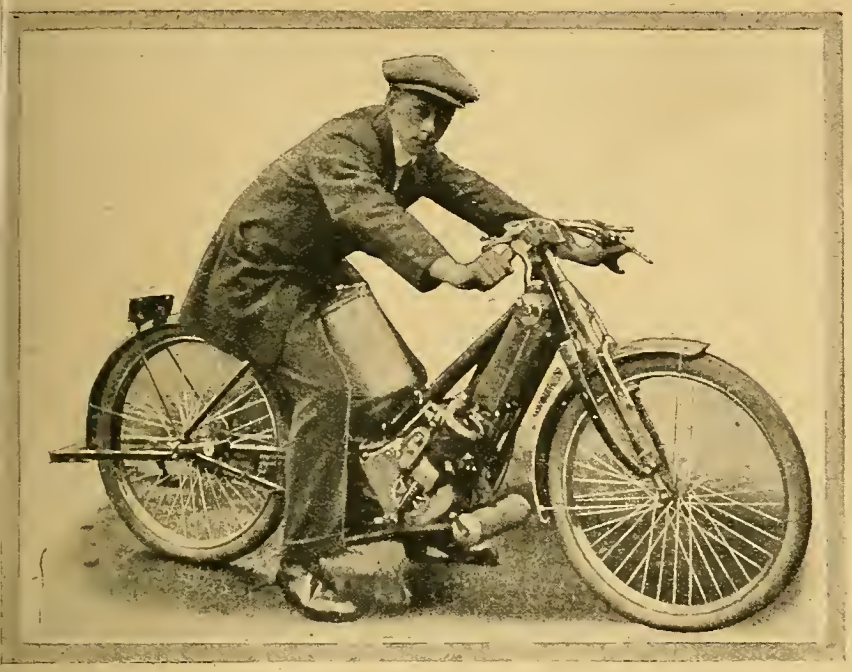
SPECIAL FEATURES.

TOURIST TROPHY MODELS.
THE TEAM TRIAL.
THE SIX DAYS' TRIALS REGULATIONS.



Next Week's Issue.

Next week's issue will be specially enlarged. Appearing on the eve of the Tourist Trophy Races, it will contain details of the competitors' machines, photographs of the practising, and latest information in connection with the races.



A number of other special articles will be included in this T.T. and Summer Number, and illustrations will be a feature.

Dinas Mawddwy the Attraction.

On the 16th inst. two Rudge multi-riders—F. J. Clarke and Stanley Heales, of Coventry—journeyed over to Dinas Mawddwy in order to try Bwlch-y-Groes, and there found A. Stewart Lloyd and Marcus Glasgow, on T.T. Triumphs, attempting the climb. Mr. Lloyd is the writer of the letter which appeared in our last issue. All were successful in climbing the pass, so the number of successes on motor bicycles to date is six. A week hence we have no doubt a sidecarist will have proved successful.

The first of the 8 h.p. water-cooled Williamson motor cycles. This machine has a horizontal engine and two-speed gear. It was seen at Daventry on the occasion of the Team Trial.

F. A. Applebee on his 1912 T.T. Scott.

Hill-climbing and Reliability Trial.

A course, which included Cudham Church, Toys, and Brasted hills, was used by the Brookdale Club last Saturday for a reliability trial with the following result: First, F. G. Kennard (Matchless), error 42s.; second, E. M. Oliver (Triumph), 102s.; third, H. A. Cooper (Bradbury), 104s.

New Cyclecar Record.

44 miles 1,650 yards were covered in one hour at Brooklands last week by J. T. Wood driving an 8 h.p. G.W.K. cyclecar. This interesting machine it will be remembered has a friction drive. The distance covered is a record for its type, the previous best being 43 miles 1,034 yards by a Bedelia.

Police Traps.

A trap is in operation in Richmond Park, starting about two hundred yards from the main Richmond Gate on the road to Kingston. Motor cyclists are recommended to exercise caution everywhere in the park.

Riders should exercise care in the near future in Ashton, Mottram, and Hollingworth, which are in the district of Stalybridge, and particularly in Mottram Road, Stalybridge.

Illuminating the Identification Plate.

Two Whitstable motor cyclists were summoned at Canterbury on Saturday last for failing properly to illuminate their identification plates. The solicitor for the defence said they were stopped under a powerful street lamp of 250 c.p., and their lamps, which were of 60 c.p., had no chance of showing their illuminating power under such circumstances. The magistrates' opinion was that the manufacturers were at fault; defendants had good lamps, and the identification plates were in order, but the light did not illuminate the plate. The cases were dismissed on payment of costs.

NEXT THURSDAY.

THE MOTOR CYCLE

T.T. and Summer Number

Motor Cyclists and the C.T.C.

At a meeting of the motor cyclist members of the C.T.C. resident in the Manchester district it was decided to form a motor cycle section.

A Change of Mounts.

W. Creyton, the old Triumph rider, who was first home on a single-cylinder machine two years ago, will ride a Junior T.T. Humber next week.

English-Dutch Trial.

Owing to extreme pressure on our space we are obliged to hold over an article concerning the Dutch International Trial until next week. There are now plenty of Dutchmen entered for the event, and the difficulty of the organising club, the Dutch M.C.C., is to choose a representative team.

M.C.C. Team Trial.

Donald S. Parsons, who was picked as a reserve in the Essex M.C. team, and whose presence was sought for last Saturday at Daventry, his place being finally filled by W. H. Wells, has sent us particulars of the reason he failed to reach the rendezvous in time. Tyre troubles dogged his footsteps from the start, and although he fitted new wheels, tyres, and tubes he only succeeded in reaching Daventry at 6.10 p.m., although he left home (Romford) about half-past six the same morning.

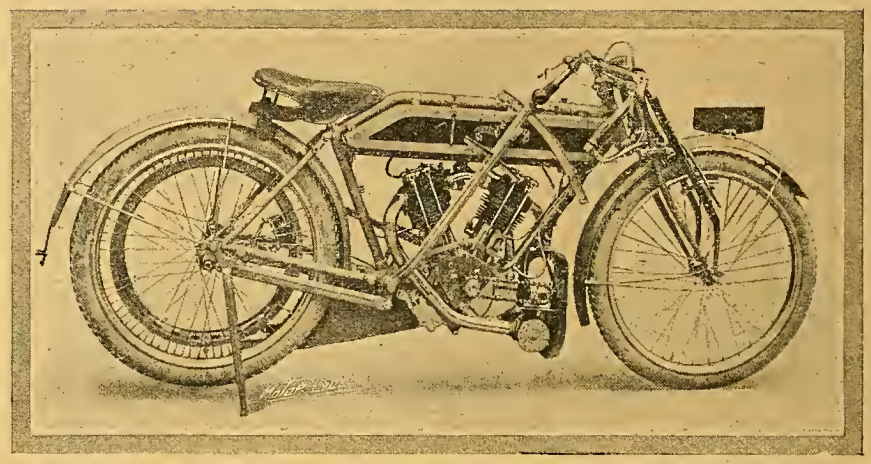
Of the South Birmingham team, J. H. Percox (Alldays) had water in the petrol, and L. Poole (B.S.A.) had his one-gallon spare petrol tank come loose, and carried it under his arm for forty miles, then his stand fell, and he kicked it up innumerable times until S. A. Rowlandson, riding behind, closed the spring by kicking it up against the back tyre. Considering the above, the South Birmingham Club's performance in being placed third is an excellent one.

THREE SINGER T.T. RIDERS. H. Petty, R. G. Mundy, and D. R. O'Donovan, who will ride Singer machines in the T.T. Races.

TOURIST TROPHY RACES.

News from the Island. Improvements to the Course. Advance Details of T.T. Models.

Tuesday, June 18th.



Practising for the T.T. Races begins on the course to-morrow (Wednesday). A few riders are in the island already, and by to-morrow the greater proportion of them will be on the roads. The two Manx riders, D. M. Brown on his twin Humber and Smith on his Triumph, fitted with a Sturmey-Archer gear, arrived on Sunday from Coventry.

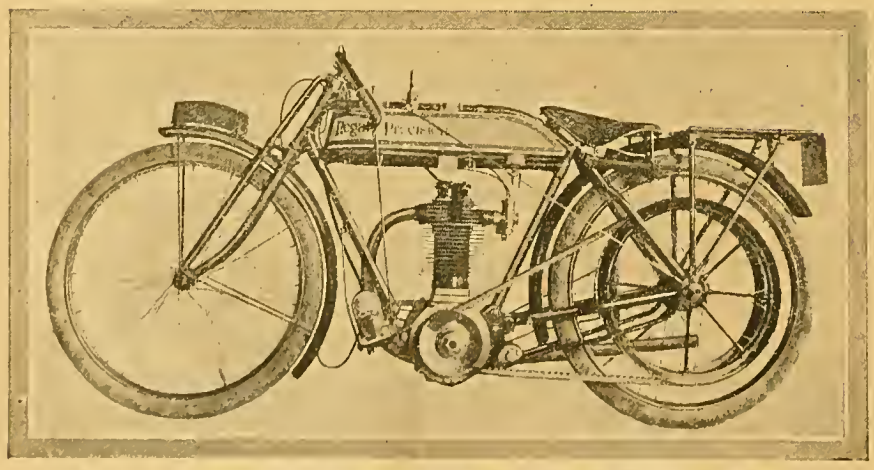
Indignation is felt in the island by the action of the Auto Cycle Union in disqualifying Woodman because he has only one leg. Woodman has lived in England three years purposely to ride in the T.T. Races, and this year he was to have ridden a Humber. He has a good reputation as a rider on the island, where he has made his home for some time. This year's rule that competitors must not use their machines during the daytime is also causing annoyance, and some of the competitors have had to cancel their apartments at the country hotels along the course. The rule was made to prevent riders annoying country people by travelling fast at all hours of the day. The police have instructions to proceed against all riders who drive in any way to the danger of the public. Most of the competitors are stopping in Douglas, and the A.C.U. headquarters are again at the Hotel Selton on the promenade. The Triumphs and the Scotts will be at the Prince of Wales Hotel, Ramsey, and over a dozen are going to stop at Glen Helen, and several at the hotels in Peel.

Great improvements have been made to the Quarter Bridge corner (see illustration page 68), where the road has been widened considerably. Care at this corner will, however, be necessary as of yore. The corner near Mr. Hall Caine's residence has also been widened, and now is an "all out" curve.

Triumphs.

The Triumph machines to be ridden by J. R. Haswell and Ivan B. Hart-Davies possess no radical alterations from standard T.T. practice, with the exception that Sturmer-Archer gears are fitted, not with three ratios, but two only, for which the Triumph Co. have made a new gear operating mechanism. With three ratios one must find the right notch, but with the Triumph adaptation it is "high" or "low," and so simplicity itself in changing, no matter how hurriedly.

Valve side of the new T.T. twin Matchless, showing gear changing lever, etc.



E. B. Ware, who will ride a Zenith in the T.T., with the new 493 c.c. J.A.P. engine.

Alcyon.

N. D. Slatter is not quite sure which of the two machines he has at present he will use in the Junior Race. Of these, one is fitted with a standard type of engine, 348 c.c., Mabon gear, and side by side valves. The other, which has not yet arrived from France, has also practically the same cylinder capacity. The engine, however, is interesting in that it has four overhead valves, one at each corner. The valves are set at an angle of 45°. The transmission is by chain, and the two-speed gear is the Rivière.

The Matchless T.T. Machines.

The 1912 T.T. Matchless machines differ in but minor details from those which were run last year. The variable gear is retained, but this has been improved considerably so far as handiness in practical use is concerned. The engine is a 3½ h.p. twin-Jap, constructed specially for the Matchless machines, and has a bore of 70 mm. and a stroke of 64.5 mm., the cubic capacity is thus 496 c.c. The valves are of the usual overhead Jap type, all mechanically operated. For its power output the engine is very light, turning the scale at 40 lbs. all on. In comparison with the size of the cylinders, the flywheels appear to be rather on the small size, but in this connection it must be pointed out that the engine is purposely designed to turn over at a very considerable speed. It is in order to keep up the revolutions and so have at command the utmost reserve of power that a special engine is being used rather than employ one of last year's pattern, 76 mm. bore, with the stroke sufficiently reduced to come within the 500 c.c. limit. With the same idea in view, the gear has this year been arranged to give the comparatively low ratios of from 3¼ to 1 to 7 to 1.

The 3½ h.p. T.T. Regal machine fitted with the new air-cooled overhead valve Precision engine. This machine has a Sturmey-Archer three-speed gear.

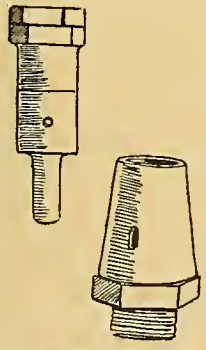
Tourist Trophy Models.—

Singer.

Of the four riders who have chosen Singer machines, three will ride the 2½ h.p. model with Sturmey-Archer gears, while H. Petty will also ride a 3½ h.p. fitted with the same gear. With the exception of foot-controlled oil pumps the owners will rely on practically standard T.T. models.

The Twin Humbers.

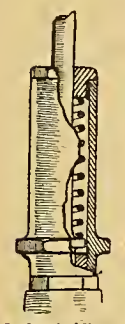
On a recent visit to the Humber works we were lucky enough to find four owners about to take delivery of their new T.T. mounts. They were P. J. Evans, Douglas Brown, J. T. Bashall, and W. Creyton. All were in the best of spirits, and appeared delighted with their machines. The little 2¾ h.p. twins have not been greatly altered for the 1912 race. The most striking change is the large tank, which is elliptical in section and fits neatly into the frame, where it is fastened by three steel bands. Armstrong three-speed hubs are fitted, as also are Amac carburetters and a neat form of handle-bar magneto control. The foot brake is supplied with a heel-operated pedal on each side of the frame, which should be a great convenience, especially for corner work. The machine in our illustration belongs to D. Brown, who has had the standard horned handle grips replaced by Rough-rider grips.



New Humber magneto control operated from the handle-bar.

Precision.

A call on Mr. F. E. Baker produced some interesting facts, for besides his usual and competition models he has three new types on the stocks, all of which will most likely be seen in the Isle of Man.

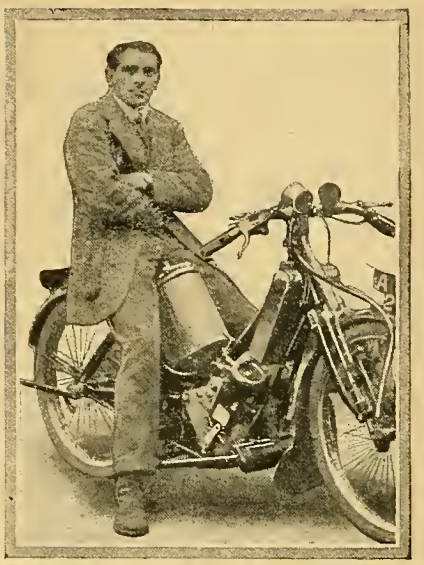


Firstly, there is the new 85 × 88 mm. overhead valve engine. This engine is more or less experimental, though it has given good results on the road. The valves open directly into the cylinder head, and may be detached, with their springs and seatings complete, in an extremely short time. One of the most noticeable features of this engine is the size of the radiating fins, which are very large where they encircle the cylinder head and gradually taper away towards the base.

Adjustable tappet and guide of the 2½ h.p. Precision.

A neat enclosed spring holds the long tappet rods down.

This is an extremely interesting engine, and its performances will be watched with great interest. Next comes the new long stroke 2½ h.p. engine, 70 × 90 mm. This engine is on the standard 2½ h.p. Precision lines throughout, however it differs in the size of its valves, the exhaust being considerably larger than the inlet. The usual Precision oil catcher on the pulley side, which has been so extensively copied, is fitted to this engine.



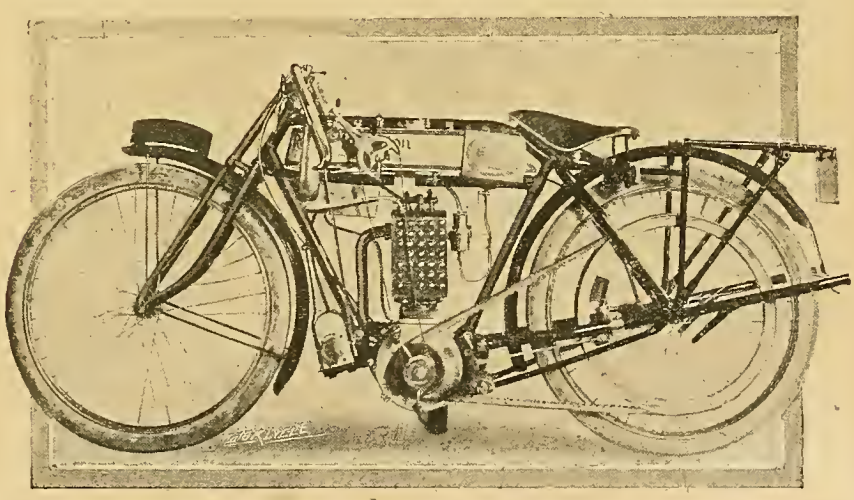
Spring holding down tappet of overhead valve

Mr. Baker tells us that his new 2½ h.p. model shows greater efficiency on test than his 3½ h.p. pattern of two years ago, surely a fine example of the progress of the industry.

Lastly, we were shown the Green water-cooled engine, 85 × 88 mm. in a state bordering on completion. F. E. Baker, Ltd., will shortly market this engine in several types suitable for motor bicycle or cycle-car work. Many of our readers will remember this engine, but for the benefit of those who do not we may say that the cylinder has overhead valves, and below these is fitted a water jacket and radiator combined, thus giving what is probably the neatest and lightest possible form of water-cooling.

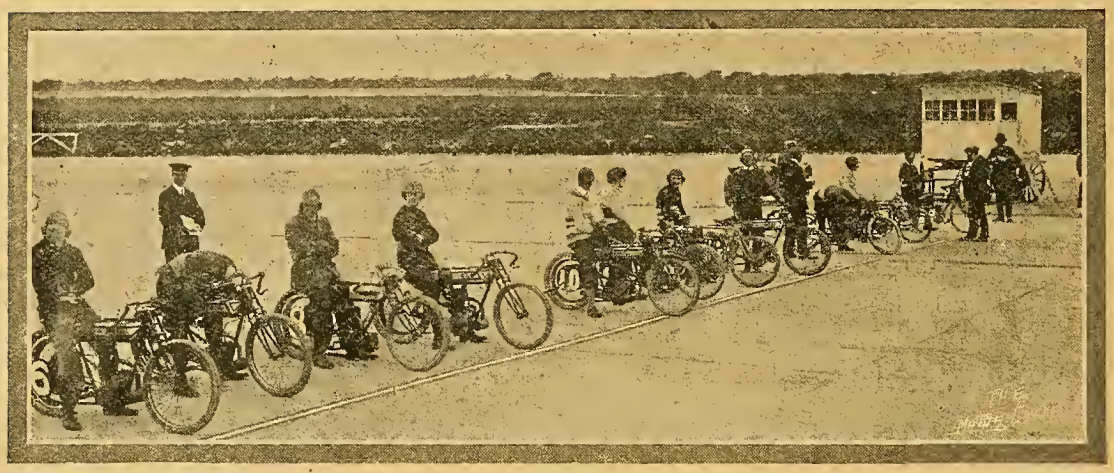
Regal-Precision.

The two types of T.T. Regal Precisions are two of the most interesting machines we have seen. Jack Woodhouse will use the 85×88 mm. overhead valve air-cooled engine, out of which we hear he has been getting good results. It is fitted with a Sturmey-Archer three-speed. Both brakes are foot operated on the rear wheel, one by each foot. H. C. Mills and S. F. Garrett will probably ride the two new water-cooled Green engined machines, which are fitted with the Brampton gear. Both air and water-cooled machines will be used in the T.T. with 28in. × 2¼in. Hutchinson tyres, rigid forks, dropped top tube, large tanks with baffle plates, and a sump for collecting foreign matter. Best and Lloyd semi-automatic lubricator, special Amac carburetter, and Bosch enclosed magneto are also features of these well thought out machines. The Regal have a very businesslike appearance, and are not unlikely to be conspicuous in the race.



Frank Philipp with his new Scott racer. It will be remembered that this rider accomplished the fastest lap in the Senior T.T. last year.

Messrs. Smith and Woodhouse, the manufacturers of this machine, tell us that, though they are doing well with their 2½ and 3½ h.p. touring models, there is a particularly big demand for the 4½ single with variable gear for sidecar work.



Two-stroke Scott.

The Scott machines supplied for this year's T.T. have a few striking alterations. The engine, 2¾in. × 2½in., is water jacketed round the cylinder only and not round the head. The distributer valve is now operated by a train of gear wheels arranged so as to be easily accessible. Two plugs are set in each cylinder head, and two long pipes extend rearwards from the silencers. 26in. × 2¼in. beaded edge tyres will be used, and also a powerful type of Crabbe brake on the rear wheel. The gear ratios will be 3—1 and 4.8—1, and the two gallon tank around the seat tube is fitted with an exceptionally large filler.

AN ENTIRELY NEW MOUNT. A 3½ h.p. T.T. water-cooled Regal-Precision, fitted with Brampton variable gear. J. W. Woodhouse will ride this machine, which is considered to have a splendid chance in the race.

B.A.R.C. JUNE MEETING.

Lined up for the start of the 8th Long Motor Cycle Handicap.

THOSE who helped to form the very fair crowd of spectators at Brooklands last Saturday saw some excellent racing, as several motor cycle events and more than one car race provided some very close finishes. The first motor cycle race was the second event on the programme—the ninth short motor cycle handicap. Distance, about 5¾ miles; fork start. First prize, £10 or cup; second prize £5 or cup; third prize £3 or cup. The weather was fairly fine, but a very strong wind was blowing. Martin's machine had a force feed petrol system fitted, which consists of a small bore pipe from the exhaust, the pipe is coiled round the outside of the main air intake and enters the carburetter behind the jet, the exhaust helping to vaporise the petrol and increase the air draught.

Edmond (2 h.p. Humber), the limit man, made a good start, while Kickham (2¾ Douglas) got away in excellent style. Edmond's diminutive Humber both in this and the next handicap race performed marvellously well. The order at the end of the first lap was—Edmond, Slatter (Alcyon), Kickham, Walker (Rudge), Manners-Smith (Rudge), Martin (Martin), Dewar (Triumph), Elce (Rudge), Timson (Rudge), Mundy (Singer), South (Rudge), Taylor (Rudge), and Luce (Bat). Luce had his belt come adrift, and Whitlark (Rex), whose engine had seized just before the race, could not start owing to sooted plugs, due to over-oiling. Edmond won by about half a mile. Winning speed, 46 m.p.h. Results:

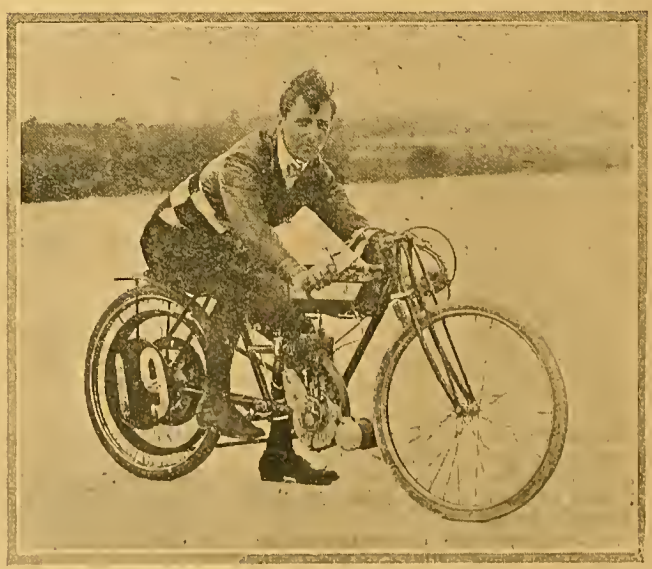
Rider and machine.	Bore and stroke.	c.c.	Start. m. s.
1. F. G. Edmond (1 Humber) ...	60 × 70 ...	198 ...	2 32
2. E. Kickham (2 Douglas) ...	61 × 60 ...	350 ...	1 6
3. W. H. Elce (1 Rudge)	85 × 88 ...	499 ...	0 20

The others finished in the following order: H. Martin (Martin), 268 c.c., 44s.; Vernon Taylor (Rudge), 499 c.c., 20s.; N. D. Slatter (Alcyon), 247 c.c., 1m. 44s.; W. D. South (Rudge), 499 c.c., 32s.; S. Timson (Rudge), 499 c.c., 32s.; W. Dewar (Triumph), 499 c.c., 32s.; J. A. Manners-Smith (Rudge), 499 c.c., 44s.; A. G. Walker (Rudge), 499 c.c., 32s.; and R. G. Mundy (Singer), 294 c.c., 56s.

Stanley, who broke an inlet valve, is now probably of the opinion that the number 13 which he bore is an unlucky one.

Eighth Long Handicap.

The next motor cycle event was the Eighth Long Motor Cycle Handicap. Distance, about 8½ miles; fork start. Prizes as in the preceding event. Whitlark's belt came off just after he had pushed off, and Mundy failed to start owing to plug trouble. The first lap order was—Edmond, Slatter, Kickham, Martin, Manners-Smith (Triumph), Fowler (Rudge), Timson, South, Dewar, Elce, Taylor, and Stanley. The second lap order was—Edmond, Slatter, Kickham, Elce, Manners-Smith, Timson, Stanley, Fowler, Dewar, and Taylor. Edmond again won easily by about a kilometre. His speed was 48 m.p.h., which is a wonderful performance for so small an engine. Result



Rider and machine.	Bore and stroke.	c.c.	Start. m. s.
1. F. G. Edmond (1 Humber) ...	60 × 70 ...	198 ...	4 0
2. G. E. Stanley (1 Singer) ...	85 × 88 ...	499 ...	0 39
3. E. Kickham (2 Douglas) ...	61 × 60 ...	351 ...	2 15

The positions of the others were: N. D. Slatter (Alcyon), 247 c.c., handicap 3m. 12s.; S. Timson (Rudge), 499 c.c., 1m. 24s.; W. Dewar (Triumph), 499 c.c., 1m. 24s.; V. Taylor (Rudge), 499 c.c., 1m. 6s.; W. G. Fowler (Rudge), 499 c.c., 1m. 42s.

An Innovation—One Design Races.

The one design sprint races were an excellent innovation, the idea, it is said, of Mr. F. P. Armstrong, whose experience in yacht racing doubtless prompted him to urge the adoption of a similar series of races for motor cycles. Mr. Armstrong is a prominent member of the Royal Motor Yacht Club, and a steward and a member of the B.A.R.C. committee.

The event was divided into three races—Race A for 2½ h.p. Singers, 69 × 80 mm.; Race B for 3½ h.p. Rudges, 85 × 88 mm.; Race C for twin Zeniths with sidecars, engines not exceeding 1,000 c.c. In Race A, O'Donovan and Petty were riding the machines they will use in the Junior T.T. race.

F. G. Edmond (2 h.p. Humber), winner of the Ninth Short and Eighth Long Motor Cycle Handicaps at Brooklands last Saturday. He averaged no less than 48 m.p.h.

The B.A.R.C. June Meeting.—

The distance of these sprint handicaps was about two miles, extending from the starting point adjacent to the railway and finishing at the long finishing line opposite the paddock.

Race A (the Singer handicap) was won by two lengths, and provided quite an exciting finish. Results :

	Handicap.		Handicap.
1. W. A. Jacobs ...	28s.	4. G. E. Stanley ...	scr.
2. J. P. le Grand ...	28s.	5. H. Petty ...	28s.
3. R. G. Mundy ...	28s.	6. D. R. O'Donovan	28s.

The winner's speed was 48 m.p.h. During the race the adjustable pulley locking nut became loose, and so, we are informed, the gear ratio worked itself up to 3½ to 1.

The Rudge race was won by about ten lengths. Winner's speed, 55 m.p.h. Result :

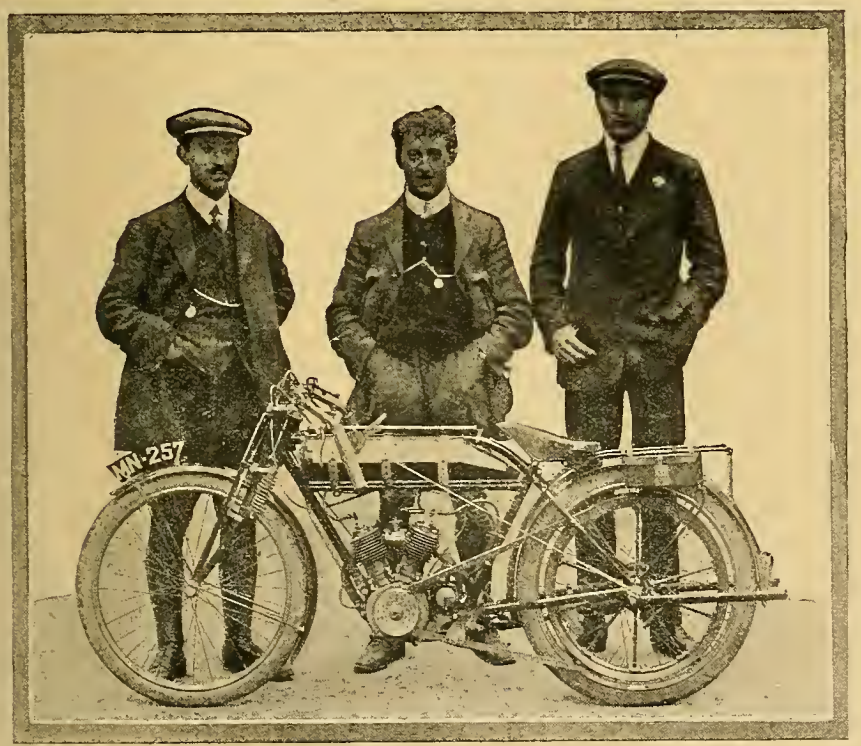
	Handicap.		Handicap.
1. A. G. Walker ...	14s.	11. W. D. South ...	6s.
2. M. G. Flemming	28s.	12. S. Timson ...	14s.
3. A. A. Woodington	22s.	13. W. H. Edwards	28s.
4. B. C. Remington	18s.	14. E. Heis ...	18s.
5. C. Pressland ...	22s.	15. V. Taylor ...	6s.
6. S. R. Cooke ...	18s.	16. V. Leggatt ...	22s.
7. C. Pattison ...	18s.	17. Basil Collier ...	18s.
8. W. Gordon Fowler	14s.	18. C. Janicker ...	10s.
9. F. G. Picken ...	24s.	19. R. T. Wood ...	18s.
10. H. C. Vine ...	18s.	20. H. W. Farmer ...	28s.

The Twin Zenith Sidecar Race was the first sidecar event at a B.A.R.C. meeting and was quite interesting. Charlesworth, whose speed was 47¼ miles an hour, won easily, and about a length separated the second and third. Result :

	Hcp. c.c.	Hcp. s.		Hcp. c.c.	Hcp. s.
1. R. Charlesworth	771	55	8. H. H. Huckle...	771	55
2. W. Moore ...	771	60	9. W. G. Bower...	771	50
3. H. Luxford ...	771	60	10. W. J. Marshall	771	60
4. E. B. Ware ...	494	65	11. F. W. Barnes	990	scr.
5. L. P. Openshaw	964	37	12. G. F. Hunter...	990	5
6. P. Weatherilt...	744	35	13. A. J. Luce ...	771	55
7. H. Jepson ...	771	45	14. M. L. Ainslie...	771	50

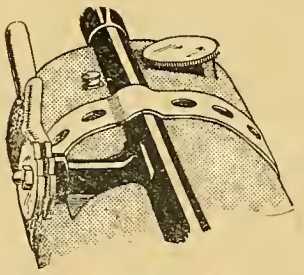
Barnes and Hunter had an exciting struggle at the finish. Ware rode his T.T. Zenith. F. R. Tillman gave up owing to a broken carburetter control wire. We have previously advocated "one design" races in *The Motor Cycle*, and trust the idea will be further developed. To render a "one design" race a success every machine should be identical as regards equipment even to the most minute detail.

A KNOTTY PROBLEM.



In response to the paragraph in our issue of May 30th asking readers who felt capable of tackling a difficult problem in connection with a Catford rider's motor bicycle to communicate with the owner, quite a number of replies have been received for "Perplexed."

DUBLIN AND DISTRICT M.C.C. ALL-DAY OPEN TRIAL.



The Dublin and District Motor Cycle Club held a twenty-four hours' reliability trial on the 14th and 15th inst., over a course of 420 miles, with the usual regulations. The weather was very disagreeable for the greater portion of the time, and consequently the trial proved a particularly strenuous one. The start took place at 6 p.m. from Dublin, when the following were despatched at one minute intervals, there being but one absentee from the sixteen entrants : W. F. Parker (3½ Humber, 2-speed), J. Browne (3½ New Hudson, 3-speed), J. Doleman (3½ Triumph), J. H. Taylor (3½ Rudge), T. Woods (3½ Bradbury, 3-speed), C. E. Murphy (3½ Triumph), J. L. Walshe (6 Enfield sc.), T. E. Greene (3½ Rudge), Hugh Gibson (3½ Bradbury sc.), T. J. Dunphy (7 Indian), J. Healy (3½ Rudge), G. Roche (3½ Rover), O. G. Price (3½ Rudge, free engine), C. P. Kirk (3½ T.T. Triumph), and C. Magennis (3½ Rudge, free engine).

Rough Weather Throughout.

The journey to Belfast and Derry through the night was a very severe test, as much rain was experienced in the north; but the real trial came in Donegal, where it rained in torrents for several successive hours. Indeed, the riders did not get out of the rain belt until Cavan was reached on Saturday afternoon on the return journey. The ascent of Glengesh on Saturday was the deciding part of the ride. This hill is generally regarded as the worst in Ireland. It has a gradient of 1 in 7, but its worst features are its hairpin bends.

A TRIO OF JUNIOR T.T. COMPETITORS. P. J. Evans (present holder of the Junior Tourist Trophy), Douglas Brown and J. T. Basball, who will all ride 2¾ h.p. twin Humbers in next week's Isle of Man race

Front end of the 2¾ h.p. T.T. Humber torpedo tank, showing change-speed lever fixing.

There was a scale of penalties for failure, based on horse-power and gear ratio. The only riders to make clean ascents were Greene (Rudge), Roche (Rover), and Healy (Rudge). All these were on single-geared machines, the Rover being geared 6½ to 1, and the two Rudges 6¼ to 1.

Taylor, Woods, Murphy, Greene, Gibson, Healy, Roche, and Kirk completed the journey to schedule time.

CUB NEWS

Manchester Wednesday M. and C.C.

The first hill-climb of the season was held at Heydon Bridge, near Woodhead, on the 12th inst. Results: 1, J. Smith (T.T. Triumph); 2, J. Ives (Triumph).

Belfast and District M.C.

The annual reliability run for the Jaffe Cup was held on the 8th inst. from Belfast to Enniskillen (200 miles). Results: 1, Wm. Kearney (3½ Rudge with sidecar and passenger), lost two marks; 2, Tom Mallon (3½ Premier), lost three marks; 3, James McBride (3½ Premier), lost four marks.

Pontefract M.C.

The annual hill-climb was run off on the 13th inst. at Castle Syke Hill, near Ackworth. The members' class was run off first, but the times were not recorded owing to the electrical timing not working. The knock-out class provided good sport and ended in a tie, the brothers Finn, riding the same machine (6 h.p. Enfield), being in the final. An attempt was made to run the members' class later on in the afternoon, but shortly after the start an accident occurred which unfortunately ended the day's sport.

Motor Cycle Union of Ireland (Ulster Centre).

A further series of open speed trials were held at Magilligan Strand on Saturday afternoon. There was a very good entry, and keen contests were the order of the day. The results were:

FOUR MILES SCRATCH (for machines not exceeding 600 c.c.).

		M.	S.
1.	F. W. Adams (3½ B.S.A. T.T.)	4	11
2.	W. J. Chambers (3½ B.S.A. T.T.) ...	4	22
3.	J. Stewart (3½ Triumph T.T.)	4	28

TEN MILES HANDICAP.

		Hcp. S.	Nett time. M.	S.
1.	J. Lavery (3½ Ariel)	54 ...	12	48
2.	C. Pyper (3½ Zenith-Gradua) ...	scr. ...	13	34
3.	B. D. Capper (3½ Triumph T.T.)	24 ...	13	39

FIFTY MILES HANDICAP.

1.	B. D. Capper (3½ Triumph T.T.)	7 ...	62	18
2.	J. R. Thompson (3½ B.S.A. T.T.)	6 ...	62	21
3.	J. Lavery (3½ Ariel T.T.) ...	9½ ...	65.55	

Wigan M.C.

The following are the results of the Wigan M.C. 200 miles reliability run to Coventry and back on Wednesday, the 12th inst: First, J. Baker (3¾ Scott), 1½m. error; second, E. Sankey (3½ Triumph), 2m. error; third, R. King (7 Indian), 4m. error. Time schedule four and a half hours each journey, including half-hour control stop at Stone.

Scarborough M.C.

The Scarborough Motor Club held their annual gymkhana on the 15th inst. on the new Marine Drive, Scarborough. The weather being fine, the event was a great success. The following were the results:

Event 1.—Slow Race: 1, Dan Bradbury; 2, H. Frain; 3, J. Tranmer.

Needle-threading Race.—1, Bringham; 2, J. W. F. Tranmer; 3, S. Clay.

Lifebelt Race.—1, Vernon Gash; 2, S. Clay; 3, J. Tranmer.

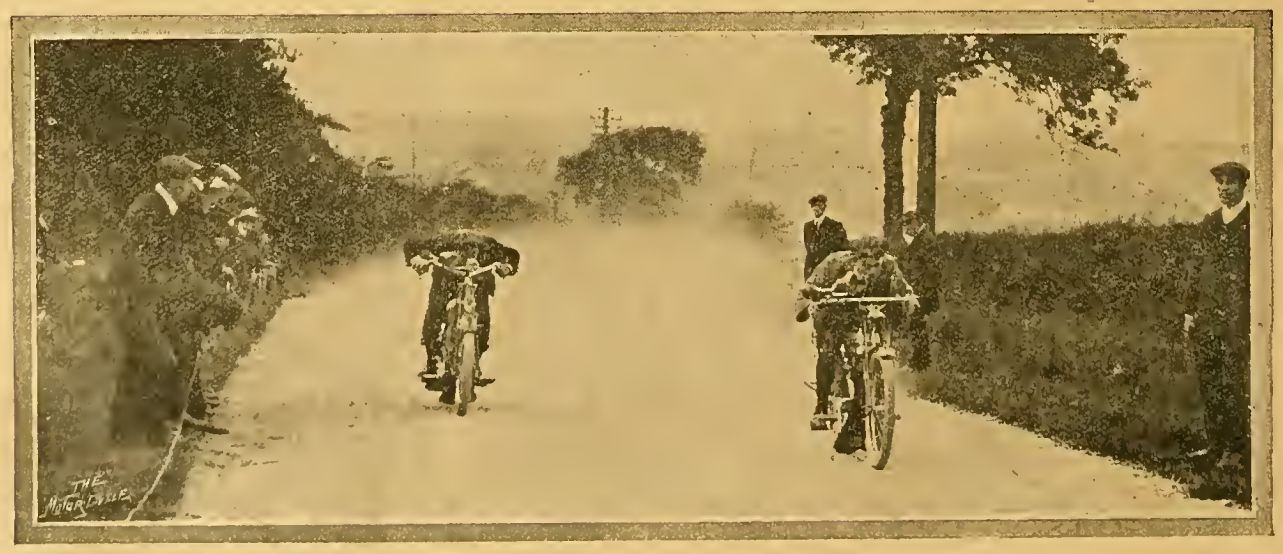
Bomb Race.—1, Atkinson; 2, S. Clay.

Academy Stakes (Drawing Race).—1, Dan Bradbury; 2, H. Frain; 3, J. Dent. This event proved most amusing.

Blackpool and Fylde M.C.C.

A petrol consumption trial was held over a course from Blackpool to Ingleton, a distance of forty-five miles. The results, which were worked out on formula, were as follows:

	Rider and machine.	Miles per gal.	Fig. of merit.
1.	C. C. Humber (2¾ Douglas) ...	200	812
2.	F. Naylor (7-9 Indian and sidecar)	85.20	603
3.	T. Bull (8 Matchless and sidecar) ...	83.72	555



Westmorland M.C.C.

A reliability run held on the 2nd inst. to Chester and back for the Lonsdale Challenge Cup resulted in five competitors finishing equal. The results of the ensuing re-run were: 1, L. Pierce (N.S.U); 2, L. Pennington (Scott); 3, W. Hutchinson (Zenith).

The following were the results of the hill-climb held up Orton Scar for the President's prizes on June 15th:

Single-cylinder.—1, G. W. Braithwaite (Zenith); 2, B. Jefferys (Triumph); 3, L. Pierce (Corah).

Twin-cylinder.—1, L. S. Parker (Scott); 2, R. Shaw (Scott); 3, A. J. Moffat (Zenith).

Final of the Pontefract M.C. hill-climb. A Triumph and Enfield rider at full speed. The latter afterwards ran off the course.

Club News.—

Some of the competitors in the Wigan M.C. 200 miles reliability trial at the turning point—Coventry.

Putney and District M.C.C.

A hill-climb will be held on the 22nd inst. Members will meet at the Green Man, Putney Heath, at 2.15.

Stockport and District M.C.C.

The first reliability run is to be held on the 23rd inst. A hill-climb took place on the 19th ult. The fastest time of the day was made by H. Marsden (7 Matchless). Results :

CLASS I.

Rider and machine.	Formula.	Time.
		M. S.
1. E. Woods (2¼ Levis)	120.6 ...	2 33⅘
2. R. Rivett (2¾ Enfield) ...	149.9 ...	2 6⅘
CLASS II.		
1. H. J. Scale (3½ Triumph) ...	131.1 ...	1 35⅖
2. E. Abram (3½ Matchless) ...	155.1 ...	1 46
CLASS III.		
1. H. Marsden (7 Matchless) ...	181.2 ...	1 17⅖
2. F. Sirett (7 Indian)	196.9 ...	1 18⅖
3. J. McCann (7 Indian)	198.3 ...	1 22⅖
CLASS IV.		
1. Joe Woodrow (6 Chater-Lea)...	151.3 ...	2 29⅕
2. H. Greenhalgh (8 Matchless)...	160.4 ...	2 1⅕

Wansbeck M.C.C.

There was a large assembly of motorists at Morpeth on the 9th inst. for the annual reliability trial to Penrith and back.

Result : 1, W. Cookson, error 72s. ; 2, L. W. Hall, error 77s. ; 3, J. Main, error 85s.

South Birmingham M.C.C.

A reliability trial will be held on the 22nd inst. The start will be from the Horse Shoes, Hall Green, at 2.30 p.m., and the route *viâ* Stratford-on-Avon, Sunrising Hill, Kineton, Wellesbourne Hastings (tea), returning in the opposite direction up Edge Hill. The two test hills will be observed.

Purley and District M.C.C.

The night trial on the 8th inst. to Battle and back (111 miles) was won by S. J. Tayler (2½ A.J.S.), V. Tomkins (Rover) being second, and E. M. Oliver (Triumph) third.

There were seventeen entries and fifteen starters. Thick, white fog and greasy roads characterised the outward journey, but the conditions on the return were very pleasant.

Rotherham and District M.C.C.

A most successful hill-climb was held at Ulley on the evening of the 7th inst. The hill was of a winding nature with a stiff gradient, and one-third of a mile long. Results :

SINGLES.—E. Cross (3½ Bradbury), 33⅕s. ; L. Shepherd (3½ Triumph), 35⅖s. ; J. Baker (3½ Rudge), 35⅗s. ; — Watson (3½ Premier), 35⅗s.

TWINS.—H. Redge Garnet (6 Matchless), 30⅘s. ; G. Randeson (6 Matchless), 36s. ; M. Newbould (6 Rex), 39s.

PASSENGER MACHINES.—Dr. W. Land Debb (6 Rex sc.), 49s. ; E. Cross (6 Matchless sc.), 50⅗s. ; Dr. McDonald (8 Bat sc.), 57⅖s.

Wishaw and District M. and M.C.C.

In connection with the reliability trial, Mr. W. H. Cox, of the Automobile Association, has now made his awards as follows : 1, George Brown (3½ Triumph), marks lost 11 ; 2, John Adams (3½ Zenith), 20 ; 3, Walter Marshall (3 Clarendon), 27.

Middlesbrough and District M.C.C.

Notwithstanding the unfavourable weather there was a good muster on Wednesday evening, the 5th inst., for the reliability trial promoted by the Middlesbrough and District M.C.C. Eight sidecars and four solo machines competed on a circular course of about 22½ miles, which had to be traversed twice at a speed of 20 m.p.h. The result was as follows : 1, Challons (3½ Premier), lost 5 marks ; 2, Armstrong (3½ James and sc.), lost 7½ marks ; 3, Sproates (3½ Triumph and sc.), lost 10½ marks.

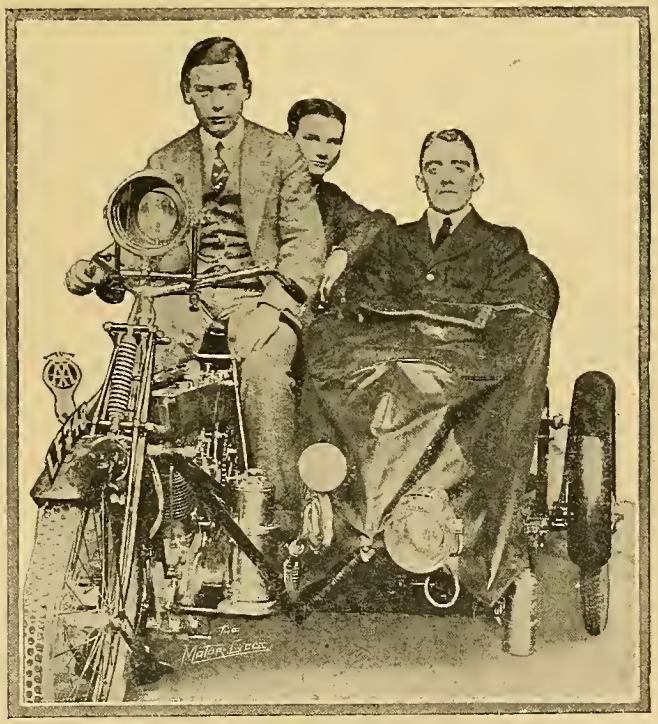
Cumberland County M.C.C.

A knock-out hill-climb was held on Fang's Brow, Loweswater, on the 8th inst. The semi-finals were as under :

Main (6 T.T. Rex) beat Barron (3½ T.T. Singer), Hilton Robinson (3½ T.T. B.S.A.) beat Beck (3½ T. T. Triumph). Final : Main beat Robinson. Robinson was leading by twenty yards, but when thirty yards from the finish his engine stopped firing for no apparent reason.

A slow climb was got up on the spot with the following result : Brownrigg (6 Zenith) beat Beck (T.T. Triumph), W. B. Robinson (3½ B.S.A. two-speed) beat Iredale (3¾ Scott). Final : Robinson beat Brownrigg.

Haverstock M.C.C.



A hundred miles reliability trial was held on the 9th inst., and the following received awards :

Gold Medals : W. Bishop (2½ Brown), full marks 100 ; A. Lunnon (2½ Brown), 100 ; H. Moliver (3½ Rudge Multi), 100.

Silver Medals : W. Brown (3½ Zenith and sc.), 87 marks ; D. Ackland (3½ Rudge Multi and sc.), 83.

There will be another competition on the 7th July, round a course of about fifty miles.

The course will be kept secret until the morning of the trial, and each competitor will have to keep to a schedule speed. Full particulars can be obtained of the hon. secretary, Mr. H. Moliver, 81, Prince of Wales Road, N.W.

A HEAVY LOAD.

The photograph reproduced above shows how F. E. Pither journeyed from Edinburgh to London on a 6 h.p. Enfield sidecar combination. He believes that this is the longest distance covered in the manner illustrated.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Cardiff to Harrogate.

Will you please give me the best route for motor cycle and sidecar from Cardiff to Harrogate (avoiding towns as much as possible) and the distance?—J.P.

Your best route would be as follows: Cardiff, Newport, Chepstow, Gloucester, Tewkesbury, Evesham, Stratford-on-Avon, Warwick, Coventry, Loughborough, Nottingham (turning right at Trent Bridge), Newark, Tuxford, Retford, Doncaster, Ferrybridge, Aherford, Wetherby, Spofforth, to Harrogate. This is rather a long way round, but it misses all the big towns. The distance is approximately 270 miles.

A Stiff Engine.

My machine is in first-class condition in every respect, but the engine is so stiff that I cannot revolve the pedals on the stand, and have to run with machine 100 yards at least before engine will fire. Now it is not due to want of lubrication or over-lubrication, as it has been thoroughly washed out with paraffin, and, though starting easier, the next day it was as stiff as ever.—NOVICE.

The matter is one which should be looked into carefully. Either it is due to too thick an oil being used, to a tight bearing, to the piston being too tight in the cylinder, or to the valve lifter not releasing compression. We should be inclined to think that the first is the fault.

Wanted, Slow Speeds.

I have invested in a 5-6 h.p. twin Rex motor cycle converted from an accumulator to a magneto and B. and B. carburetter (No. 32 jet), gear 4½ to 1. It is a grand goer at 15 m.p.h. or over, but it does not fire at all evenly at a lower speed which makes it extremely awkward on bad roads and through traffic. How would you advise me to rectify this fault? Would a smaller jet make it slower, if so, what size jet do you recomend?—J.W.M.

The trouble may be (1) that the automatic inlet valves have too strong springs, but if you weaken them you will lose somewhat in efficiency at high speeds, (2) that the carburetter does not give sufficiently strong a mixture at slow speeds, or (3) that the ignition is too far advanced. All machines with automatic inlet valves are difficult to control at low speeds. You might try a No. 28 jet.

Variable Compression.

(1.) Would a variable compression device take the place of a change speed gear? (2.) Does a lower compression enable a machine to climb a hill which a high compression engine would refuse? Or does the lower gear allowable on a lower compression motor account for this?—A.K. (Chicago).

(1.) A variable compression device would not give the same advantages as a change speed gear. (2.) A low compression is of some assistance to hill-climbing. It enables the engine to climb longer without knocking, and as you say, it admits of a lower gear without overheating. In other words, no matter what gear ratio is used, a low compression engine will run further without overheating than a high compression engine. It cannot, however, by any means take the place of a change speed gear.

Excessive Consumption.

A short time ago I purchased a second-hand motor cycle fitted with a 3 h.p. a.o.i.v. engine. The ignition is by coil (plain) and battery. Gear, 6½ to 1. I soon found out that I could not get more than 30 m.p.g., and thinking that the carburetter was at fault had a Senspray fitted. There was no improvement. The engine takes very little air, and if I push the air lever further away than the gas lever misfiring results. The battery (Hellesen) registers 4.25 by voltmeter. It has occurred to me that the fault may be with the coil, but I am quite at a loss to prove this. There is no leak of petrol when the machine is on the stand nor, as far as I am aware, when travelling. The inlet valve has an opening of ⅛in., and the spring is fairly weak for easy starting. Is there any means of testing the coil? What strength of spring is suitable for the engine (inlet valve)? I am having an adjustable pulley fitted, and this ought to enable me to get about 45 m.p.g. I have no fault to find with the machine other than the excessive petrol consumption. Any suggestions to put me on the right track would be appreciated by "TROUBLED."

It is difficult to say for what reason the engine is so extravagant, unless there is a leak in the petrol tank or petrol pipe union. We should not say that the extravagance is due to the coil. You can get the coil tested by any manufacturer of electrical appliances. In gauging the capacity of dry batteries you must not go by the voltage, but by the ampèrage. The inlet valve spring, if sufficiently strong, ought not to open freely when the valve is shaken violently by the hand. With the 3 h.p. machine you should get between 90 and 100 miles to the gallon.

Woking to Brenzett, Dungeness.

I should be much obliged if you would inform me: (1.) The best and shortest route from Woking to Brenzett, near Romney, Dungeness? (2.) The total distance? (3.) Are there any bad hills? —R.A.B.

Your best route would be as follows: Woking, Ripley, Ockham, Effingham, Dorking, Reigate, Redhill, Oxted, Westerham, Crockham Hill, Tonbridge, Goudhurst, Cranbrook, Tenterden, Appledore, to Brenzett. The distance is approximately seventy-six miles. There are numerous steep hills between Effingham and Dorking, and Dorking and Westerham, and at Crockham Hill, but nothing which should worry a modern motor bicycle.

Magneto.

I have bought a second-hand 2¾ h.p. motor cycle with Bosch DA I magneto. I have tried several plugs, but only get a very small spark when I revolve the back wheel round at a fair rate. I should like to know the principle on which magnetos work. Could you recommend any books on the subject? How far should the contact screws separate? Would I get any better results if I connected a wire from the drain plug screw in the crank case to the base of the magneto?—J.C.

The principle of the magneto machine is too large a subject to explain by letter, and we would advise you to get a copy of "Motor Cycles and How to Manage Them," which explains all details. Speaking broadly, the current is induced by rapidly cutting the lines of force in a magnetic field. The contact points should be flat and clean (the makers supply a gauge to test the gap) and separate by about ½ mm. With the type of magneto you speak of the hottest spark occurs in the fully advanced position of the contact breaker. There is no necessity to fit a wire such as you describe; the magneto machine is a self-contained piece of mechanism which does not require any separate earth connection.

Kettering to Petersfield.

Could you kindly advise me the best route from Kettering to Petersfield (in Hampshire), avoiding London, and, if possible, the suburbs; also about what distance it would be? My machine is a 3½ Zenith-Gradua.—J.H.G.

We should advise you to go from Kettering to Petersfield *viâ* Wellingborough, Olney, Newport Pagnell, Woburn, then make for the main Birmingham to London Road, continuing along that as far as Dunstable, then turn to the right for Tring, over the Chilterns to Amersham, Beaconsfield, Slough, Windsor, then either *viâ* Ascot or Egham on to the London-Basingstoke Road—the latter is the better road and the easier to find. If you go by Egham, at that town you will have to turn back on your tracks and follow the London-Basingstoke Road as far as Bagshot, go straight on up the hill and keep to the left at the Jolly Farmer, through Frimley to Aldershot, Farnham, and Petersfield. The distance would be approximately 110 miles.

Extra Air Inlets.

(1.) What would be the correct size jet to use on a 1912 Amac lightweight carburetter, my machine being a 1911 2¾ two-speed Enfield? I have five jets, Nos. 24, 25, 26, 27, and 28. Also, which of these is largest and which smallest? (2.) As I find that the machine, when going on about quarter throttle, will take all the air the carburetter will allow of, I am afraid that in case I was driving on three-quarter throttle, or climbing hills, it would take more air if it could be given, and also keep the engine cooler. Would the gauze fitted to the Amac have the effect of lessening the air, and would it be advisable to take it off? Also, are the extra air inlets fitted to induction pipes useful in cases like mine, and for cooling purposes? (3.) Are the chemicals you see advertised for removing carbon deposit on cylinder and piston without removing cylinder satisfactory?—J.W.

(1.) We should advise the use of the smallest jet, No. 24. (2.) When once under way this carburetter can be used practically automatically with the air wide open, except when slowing for corners. Of course the gauze retards the air to some extent, especially if clogged. It is important to keep it quite clean, but we should not remove it unless absolutely necessary. An extra air inlet would be of service, if you are not getting enough air. (3.) We have had no actual experience of the chemical decarbonisers. The Cyclean process is excellent.

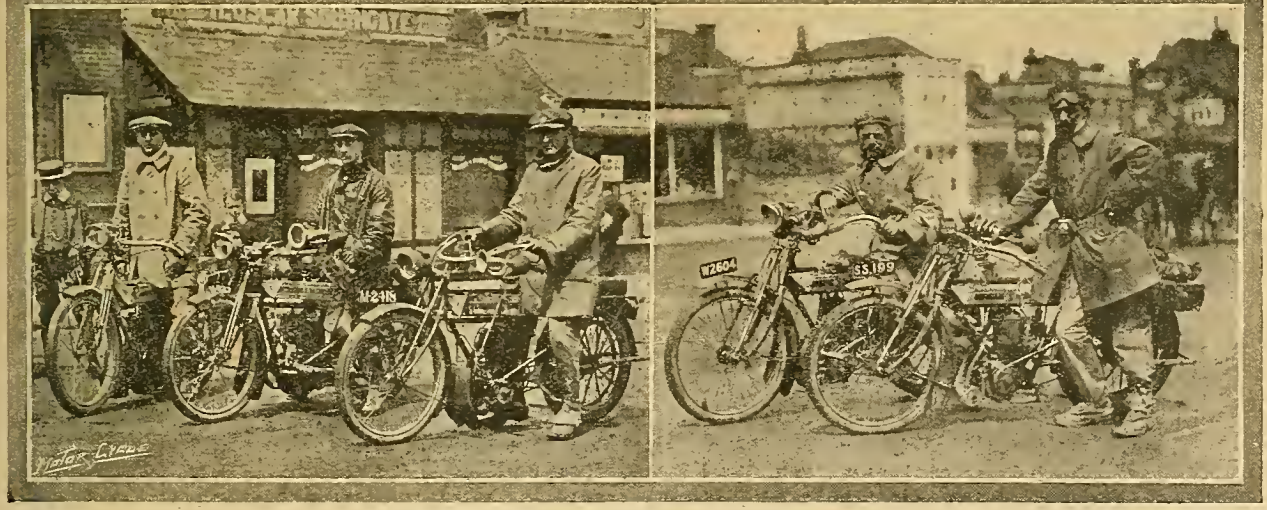
Connecting Rod Touching Flywheels.

I have been troubled lately by a kind of knocking in my 3½ h.p. 1908 single-cylinder, and have found that the connecting rod is marked up the sides and has evidently been fouling the flywheels. The marks are on the rear of the rod to the valve side and on the front of the rod to the pulley side. I had new bushes, crank-pin, and gudgeon-pin fitted not long ago, and there is no wear on them, though the connecting rod has a little side swing and the piston has side play, but of course some such play is necessary. The ball bearings on main shaft have no play either up and down or endwise. The knocking noise was absent until some time after the new bearings had been fitted; it started almost imperceptibly, and has gradually got worse; it occurs most when accelerating on the level or when climbing any hill, however easy; in fact, it is caused when there is any increase in the explosion pressure on the piston. It is most certainly caused by the connecting rod, and is not merely the result of pre-ignition. I shall be much obliged if you will tell me: (1.) Any possible reasons for the connecting rod hitting the flywheels. (2.) Can the connecting rod have become warped? If it were bent, would there not be wear only on one side? (3.) Do you think a new rod would improve matters? I have found that there is slightly more distance between the flywheels at one point than another, but this difference is almost imperceptible. Would this be sufficient to cause the trouble?—D.C.W.

(1.) Some possible reasons for your connecting rod fouling the flywheels are: (*a*) Connecting rod may be bent; (*b*) crank pin may have been put in on the cross; (*c*) piston may have got turned round slightly in the cylinder, and owing to expansion under heat the cylinder may not be quite round when the engine is working, and thus the piston may be held with the gudgeon pin slightly on the cross. (2.) The connecting rod might quite possibly become bent by such an occurrence as a backfire, for instance, when running at some speed. (3.) If the connecting rod is bent or does not lie at right-angles to its bearings, a new rod ought to improve matters, but the fact that you have found slightly more distance between the flywheels at one point than another makes it rather appear that the crank pin has not been put into the flywheels dead true, for with a small clearance between connecting rod and flywheels this might be quite sufficient to give trouble.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.



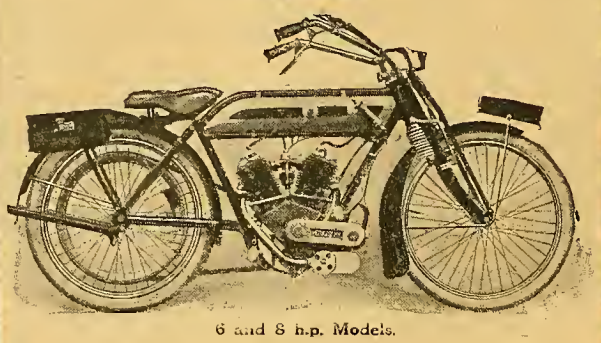
"J.S." (Keighley).—5-6 h.p. T.M.C.

"B.L.K." (Old Trafford).—5-6 h.p. F.N. for solo work. Average tyre mileage.

"G.H.B." (Easingwold).—3½ h.p. 1911 Humber. 5-6 h.p. 1911 F.N. for sidecar work, reliability, and economy.

"W.L." (Gateshead).—1912 2½ h.p. A.J.S. two-speed, particularly as regards hill-climbing, reliability, speed, and petro consumption.

"A.G." (Glasgow).—Bowden and N.S.U two-speed gears for twin and sidecar.



THE SECOND MOBILISATION TEST AT MAIDENHEAD.

(1) Getting ready to leave Maidenhead. A. Stubbs (3½ h.p. Dot), J. J. Darlow (3½ h.p. Rex), and C. R. Sprague (3½ h.p. Triumph), who came from Winsford, Chester (173 miles), and started at 4.45 a.m. (2) F. Dover and S. Sawer (3½ h.p. Premiers), who rode from Sheffield, arrived dead on time, and were awarded *The Motor Cycle* silver cigarette cases.

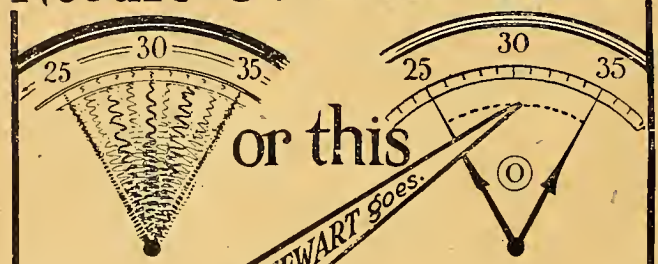
In tuning up,

GAS TIGHTNESS

of valves is of first importance. The face and seating must be perfect. This applies as much for general riding as for competitions.

The writer of these notes recently discovered that our Cycle Lamp Oil is wonderful stuff for valve grinding. The improvement is most marked.



As in the case of Huiles de Luxe, our Cycle Lamp Oil contains refined fatty oils, and these seem to preserve the cutting power of the emery. A clean and even surface is quickly obtained.

The writer advises grinding the exhaust valve with 220 corn emery, followed by flour emery, using our Cycle Lamp Oil in both cases. Then a touch up of the inlet valve with the flour emery, which, with the Oil, puts a splendid finish to the surfaces. This Oil may be used with the new Bowden Valve Grinder.

MOST AGENTS STOCK OUR 6d. TINS OF CYCLE LAMP OIL. TRY THIS TIP.

Does Your Speedometer Needle Go Like This—

The magnetic principle upon which the Stewart Speedometer works ensures a steady needle movement at all speeds. This is but one feature which differentiates the Stewart from other makes.

No centrifugal type of speedometer can give accurate registration such as the Stewart invariably does. The Stewart starts measuring speed directly the cycle starts, and it shows the actual rate of movement from zero up.

And the workmanship of the Stewart—it is so perfect that even the unmechanically-minded man can appreciate that such a fine instrument must give accurate and long service.

Fit a Stewart to your motor cycle, and in future know your speed.

Price £2 : 15 : 0

reading to 50 miles per hour and season mileage recorder.

Same instrument, but with trip recorder, £3 : 10 : 0.

Send for Booklet describing the principle of mechanism in detail, or have a Stewart for 30 days' free trial. Money returned if dissatisfied.

How to Win Motor Cycle Races.

The formula is simple—many of the most successful riders use it. Briefly, it is this—See that the machine is in perfect working order, and **Sternol** Oil only is used for lubrication.

H. C. Newman, using **Sternol,** has won almost every race in which he participated during 1912. In seven race meetings alone he obtained 21 firsts, 3 seconds, 2 thirds, 2 fastest time, and 2 on formula. Newman confirms the fact that **Sternol** is superior to every other oil. Benefit by his experience. For your next run obtain **Sternol** "A" Oil—the same as Newman used. Get it from your dealer.

GOING! GOING! GONE!

This is the Auctioneers' cry! Ours is GOING, GOING! We cannot yet say GONE, but we want you to help us, so that we may be in a position to add the last word to the phrase.

Our stock of Second-hand Motor Cycles is fairly small to what it was, but we want it to be smaller. There are exactly fifty-three machines left at the time of writing. Now, you want one of our Lists of these fifty-three, so that you can have a packet. If we can't sell them at our price, we are prepared to try and sell them at your price, but sell them we must, and, what is more, sell them we will! If you cannot pay for one in full, you shall have one by paying a deposit, and clearing off the balance by instalments. If you are a CASH BUYER, we will be pleased to put you one in at the right price, and we desire your firm offer. Our place is being filled up with new machines, which are rolling in daily. At the present moment Morgans, A.C.'s, G.W.K.'s, or Turner Cars are either in or coming in. As you know, we have only a small place, and it is soon filled up; therefore let us have your cash or deferred terms for any machine that we are Agents for, and Remember, we are Agents for everything WORTH HAVING, such as Scotts, P. and M.'s, Bradbury, Zenith, Humber, Matchless, Bat-Jap, Douglas, Premier, Clyno, Morgan Runabouts, A.C. Tricars, Motosacoche, Lincoln Elk, etc., etc., etc. We have a great many more of these machines coming in than we can find room for at any time, and as we want to have as many here as possible, please help us to shift the second-hand machines out of the road, then we shall be able to place in their stead fifty new machines. In addition to the new machines we have coming in daily, we have machines standing at different stations in various parts of the country awaiting our order.

Between you and us and the Gas Lamp, we may remark that you will find it better by far to have one of our good second-hand machines at our present price than to pay a deposit for a new machine. However, we leave the matter in your hands. We have sold hundreds of new machines on the deferred terms this year, and want your orders at once. The riding weather is just coming on, and if you have not got a machine, it is high time that you had one. There is no need to save money up, but send along £10, and we will put the deal in hand at once. The remainder of the money we can arrange on terms that will meet with your acceptance.

As we were the leading firm in previous years in the Swapping Trade, so we intend to be the LEADING FIRM in the Deferred Payment Trade. Our motto is, "There's plenty of room at the top; the bottom is generally crowded, as now." You will find that we are ready for business when you are ready to place your orders. Our deals can be put through in a simpler manner than is the case with many other firms. Write at once and state the amount you can pay down; what class of machine you want—mention one or two if you have no particular fancy—and we will write or 'phone you immediately.

If you live in the South of England, we will not trouble to have a machine sent from Morecambe, but we can arrange for you to have quick delivery, without heavy carriage to pay. If you have not had one of our lists, let us have your postcard to-day. There is sure to be something in the Accessory line that you want, and our prices are ridiculously small, and out of all proportion to the quality of the goods, therefore you should not miss the opportunity.

If you are in the Trade, our Accessories and Second-hand Motor Cycle List, less trade discount, will fix you up cheaper than you can buy from anywhere else.

If you are in the Trade, and have customers for new machines, our commission is satisfactory. You can have machines by coming down here, or have them sent through. Remember, we buy all our things right, and are therefore in a position to sell them RIGHT. You know the old saw, "Money makes the mare to go." If a firm can't buy right for want of capital, how can they expect to sell right. We know many are short of the filthy lucre at the moment.

We shall be pleased at all times for our friends to call in and see us. By the by, we would casually remark that we have stated for the last three or four months that we are selling off, and we would respectfully draw the attention of the bhoys to the fact that "selling off" does not mean "giving things away." This Whitsuntide a great number have blown in, and from the offers they have made us, we certainly think they have misinterpreted our advertisements, as we can hardly consider £25 a satisfactory price for a 1911 free-engine Triumph, neither do we feel interested in the innocent's calling in and telling us that he will give us 1/6 for a pair of Wool-lined Gloves, which are exceptionally cheap at our cut price of 4/3½.

We get a great number of letters, some of them from the knuts. This sounds interesting, when, after reading through a four-paged letter, you find that the gentleman innocently asks whether we guarantee a Motor-Cycle and Sidecar to pass his pal, who is the Captain of the "Sloppy-by-the-Sea" Cycling Club; as, if so, he will give us £8 to £10 for the combination. You feel tempted to wire, offering him a prominent position on the Staff of Buyers, or give him a Bath free of charge from the Pier Head! Kind friends, please note we are not able to do these idiotic things any more than anyone else, but we can sell you a superior Motor Cycle at a price very much less than anyone else can, for the simple reason that we want to be out, as we want the room for something else. You now have it from us, and we look forward to seeing your postcard for a list.

We have close upon 200 pairs of tyres, which are brand new, and made specially for us by a first-class firm. We have been selling them at 15/11½, 19/11½, and 24/11½. To make a move on them, you can have them at 2/- per cover discount, and we make you an exceptionally good offer. If when you get the cover you do not think same worth the money, send it back at once, and we will refund the money in full. There is also a matter of 120 tubes, white and red ones. The former we have been selling at 4/11½ and the latter 8/11½. You can take 1/- off the white tubes and 2/- off the red ones. There is also a matter of fifty or sixty butt-ended tubes, which are our usual 13/11½ line. Whilst they last you can take a couple of shillings off these.

Hitchen's, Ltd., Morecambe.

WHITELEYS

——QUEEN'S ROAD, LONDON, W.——

See that Security Sleeve?

It overcomes the one disadvantage of the Butt-ended Tube—bursting at the ends. It is the feature of the **"Challiner" Patent Butt-ended Tube.** With it you have the security of the endless tube and the handiness of the butt-ended one.

The Security Sleeve is fixed to the rim by the winged nut and bolt; the butt ends of the tube fit in it like a glove.

The centre of the Security Sleeve is a bulkhead of insulated canvas which makes *bursting of the ends an impossibility.*

'Challiner' Patent Butt-ended Tubes are burst-proof at the ends.

If a tyre fitted with this tube were inflated to bursting point, *the burst could not occur at the ends.*

The bulkhead keeps the Tube ends firmly in position; and being fixed to the rim directly opposite the valve, it prevents all 'creeping.' "Creeping" of the Butt-end Joint is what causes other tubes to burst.

Fit "Challiner's" to your mount now!

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

LIST SENT FREE.

OVER 300 NEWEST 1912 MODELS AND SECOND-HAND MOTOR CYCLES ON SHOW. LOWEST PRICES FOR CASH OR USED MACHINES TAKEN IN PART PAYMENT OF NEW.

9, SHOE LANE, FLEET STREET,
LONDON, E.C.

'Phone: Holborn, 5777.
Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o. 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Standard Machines in the T.T.

THE attention of all motor cyclists is this week focussed on that small island in the Irish Sea which by reason of its separate form of government makes it possible for us to indulge in road racing. More than the usual amount of keen interest is being evinced in T.T. events this year, both from sporting and technical views. Single and twin-cylinder machines are for the first time in the history of the race to compete on level terms. Which type will prove the faster? The answer to this query on strictly theoretical grounds would be that the single-cylinder should beat the twin on account of alleged extra internal friction in the case of all multi-cylinders. This year the races will prove real "battles of the cylinders," but whichever type comes in first the importance of the human element must not be overlooked.

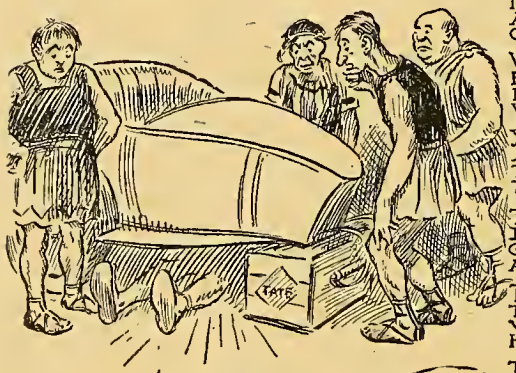
An outstanding feature of this year's T.T. models is that with very few exceptions they present no, or very few, novel features. In a sense this is as it should be, for after all the function of the races is to promote and encourage the standard touring machine, but it is only natural that such a classic event has come to be regarded as the testing ground *par excellence* for future models, so that in the past as much interest has been taken in new departures in design and minor mechanical novelties as in the races themselves. *Tempora mutantur*, however, and it would be absurd to expect to-day the same results from what is largely private enterprise as were obtained when practically the whole force of the motor cycle trade was concentrated in achieving something that should make some particular name famous.

The industry has settled down into a comfortable state of energetic prosperity which inevitably and invariably spells a disinclination to get off the beaten track. Whether the motor cycle of to-day is sufficiently perfect to stand, as it were, upon its own wheels, supported entirely by its own merit, whether the state to which the industry as a whole has attained is impregnable to the attacks of revolutionary design, remains to be seen. The point which we are wishful to bring forward is that to all appearances this year's Tourist Trophy will be more upon the lines of a "standard machine race" than ever it has been before.

To many this state of affairs will be eminently satisfactory—as for ourselves, the pointers which the past has disclosed lead us to think that matters might have been better. Progress in any mechanical enterprise is without exception accompanied by the bringing forward of *outré* ideas, things promising and things hopeless. Together they must all go into the melting pot of experiment and trial, and we have always thought that, in providing such a melting pot, the T.T. performed its most useful and valuable function. It may be that this year all the new ideas to be tried are destined to emerge successfully, and it is a pity that there are not more of them.

To quote only one example, last year's races proved the undoubted advantage of change-speed gears, and, without the publicity they gained in those contests, they certainly would not have been purchased this year with the same avidity. They literally came, saw, and conquered, although change-speed devices had been exploited for years previously with comparatively only moderate success.

BALBUS . . .
AND HIS WALL



(Balbus murum aedificabat."
Latin Grammar.)

BY Fred Gillett.

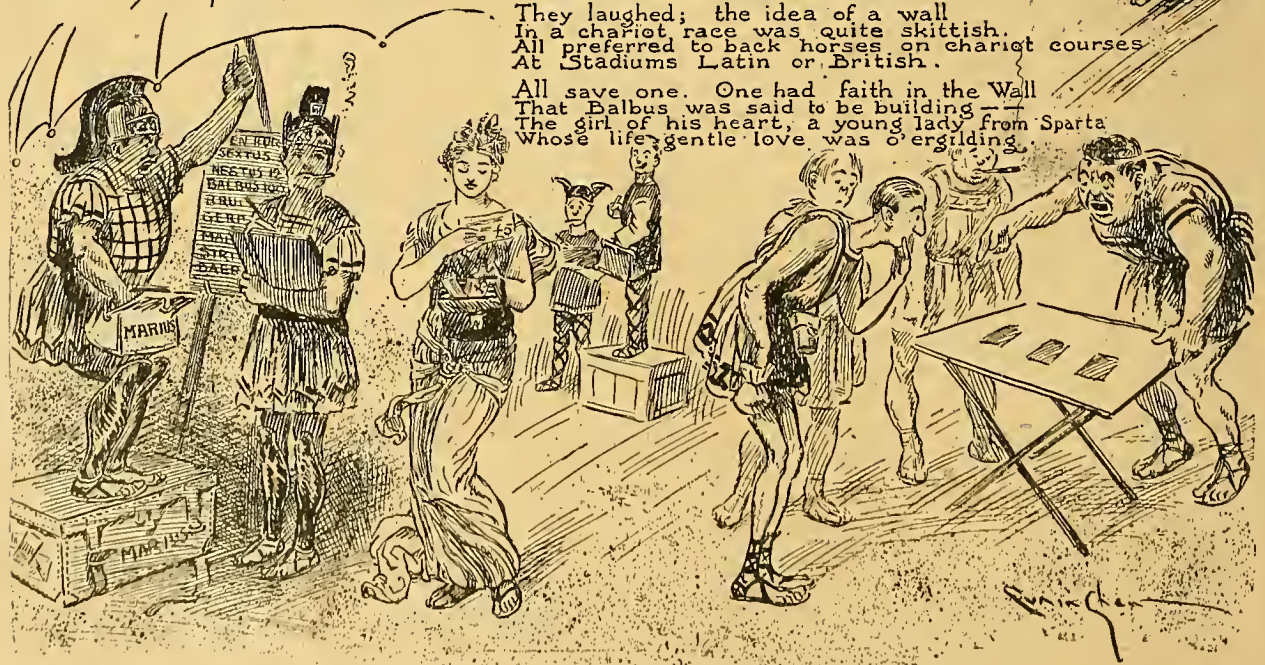
"Balbus was building a wall."
This sentence we all had to stammer
With doubtful sense of imperfect tense
In the days of our Latin Grammar.

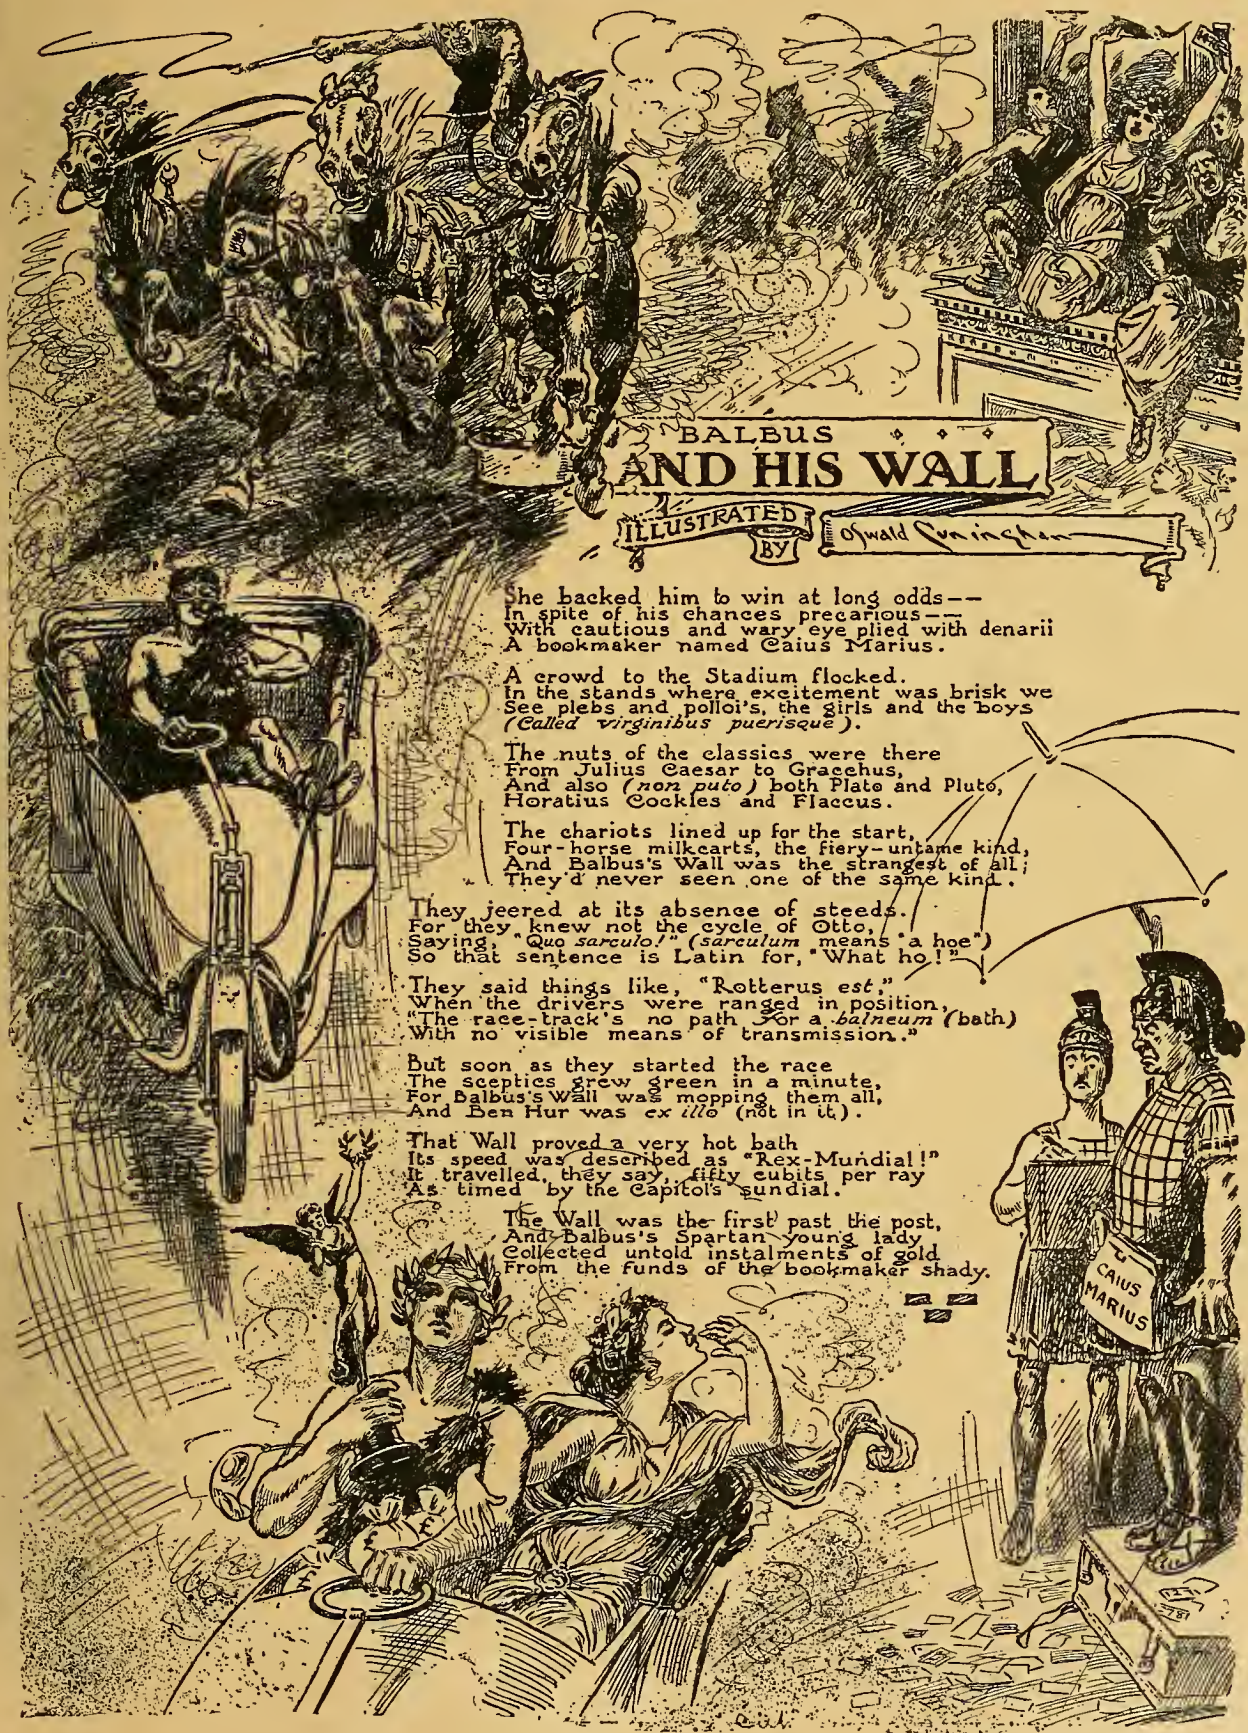
In building of murums or walls
This Balbus was second to no man.
He was, although mythic and paleolithic,
A really industrious Roman.

That sentence "was building a wall"
Is apt to mislead and bewilder,
And make one suppose that Balbus in those
Old days was a mere jerry builder.

With notions of mortar and bricks
His skill we are apt to disparage;
Let me state, once for all, that Balbus's "Wall"
Was an experimental tri-carriage!

You have it. The secret is out.
Although you receive it with mockery;
That Wall was an air-cooled Roman-bath-chair,
Not a common or garden-wall rockery.





The secret was rumoured about
By whispering tongues and hushed tonsils
Of aediles and lictors and olive-crowned victors
And amateur - also pro-consuls

That Balbus was building a Wall!--
The Forum and other old places
Were full of the news that Balbus would use
His wall in the chariot races.

They laughed; the idea of a wall
In a chariot race was quite skittish.
All preferred to back horses on chariot courses
At Stadiums Latin or British.

All save one. One had faith in the Wall
That Balbus was said to be building--
The girl of his heart, a young lady from Sparta
Whose life, gentle love was o'ergilding.

BALBUS AND HIS WALL

ILLUSTRATED BY Oswald Cunningham

She backed him to win at long odds——
In spite of his chances precarious——
With cautious and wary eye plied with denarii
A bookmaker named Caius Marius.

A crowd to the Stadium flocked.
In the stands where excitement was brisk we
See plebs and polloi's, the girls and the boys
(Called virginibus puerisque).

The nuts of the classics were there
From Julius Caesar to Gracchus,
And also *(non puto)* both Plato and Pluto,
Horatius Cockles and Flaccus.

The chariots lined up for the start,
Four-horse milkcarts, the fiery-untame kind,
And Balbus's Wall was the strangest of all;
They'd never seen one of the same kind.

They jeered at its absence of steeds.
For they knew not the cycle of Otto,
Saying, "*Quo sarculo!*" (*sarculum* means "a hoe")
So that sentence is Latin for, "What ho!"

They said things like, "Rotterus *est*,"
When the drivers were ranged in position,
"The race-track's no path for a *balneum* (bath)
With no visible means of transmission."

But soon as they started the race
The sceptics grew green in a minute,
For Balbus's Wall was mopping them all,
And Ben Hur was *ex illo* (not in it).

That Wall proved a very hot bath
Its speed was described as "Rex-Mundial!"
It travelled, they say, fifty cubits per ray
As timed by the Capitol's sundial.

The Wall was the first past the post,
And Balbus's Spartan young lady
Collected untold instalments of gold
From the funds of the bookmaker shady.

CAIUS MARIUS

Jake de Rosier.

It would be a kindly act if some leading motor cyclist would organise a subscription for poor Jake de Rosier among the riders who congregate at Douglas for the T.T. races. The old warhorse is still lying in hospital at Los Angeles with a compound fracture of the thigh and a crushed kneecap, and he will never straddle a motor cycle again. He is in such poor circumstances that his young bride has to go to work to earn her own living. Benefits have been held for him, but the proceeds so far have been rather poor. His presence added such interest to the last T.T. races, and his riding there and at Brooklands, excited such admiration that any effort on his behalf would certainly enlist sympathy.

A Criticism of the Decompressor.

A rider who has prolonged experience of an engine fitted with a decompressor informs me that in extended use he has one criticism to pass on these handy fitments. After the engine has done, say, 1,000 miles, he finds that it no longer develops sufficient power to effect a start with the decompressor in action. The engine will start, but it "wuffs" along feebly, and as soon as the rider mounts the machine stops before he can throw the decompressor out of action. He suggests that the misbehaviour is due to pitted valves or other compression leaks, still further depleting the power developed.

A new idea requires all-round criticism, but this experience is no argument against the decompressor as such. Two logical consequences result from it. One is that all engines deserve a little attention after 1,000 miles; the other is that the ideal decompressor should be adjustable, so that the deliberate leak can be reduced, when involuntary leaks set in.

There is one adjustable decompressor on the market, and if my correspondent possessed it, he would be able to start on it however badly his engine had lost tune, for he would balance the increasing involuntary leak by reducing the voluntary leak. Probably most experienced riders have at one time or another ridden machines which have so far lost their compression that they could be started at a walk without raising the exhaust valve. If so, they can imagine the delights of using a good decompressor.

Let me add that I have tested a decompressor engine on two occasions at the end of a week's ride of 500 miles, and the distance travelled had not in either case affected its efficiency.

The Six Days' Trials.

No effort should be spared to make the Six Days' Trials as pleasant a jaunt as possible for the competitors, without reducing their severity. If we consider only the sordid aspect, *i.e.*, the question of advertising the pastime, it is in the makers' interests that as many amateurs as possible should compete and succeed.

Three main features have in the past acted as deterrents to amateur entrants, viz.—(1.) The unsatisfactory nature of the hotel accommodation, both at the night stops and at the luncheon intervals. (2.) The crowding and jostling at sectional controls, often coupled with inaccurate watches, and rude or unbusinesslike marshals. (3.) The miserable character of the replenishment supplies, two boys with two funnels and two measures often having to supply fifty or sixty men against time. If Mr. Loughborough desires to maintain or increase a large amateur entry he should consider every possible reform in these directions, especially as the stiffened regulations, however essential, diminish the enjoyment of the ride.

The hotel problem can only be solved according to circumstances; there is, however, certainly room for improvement.

The section controls could easily be eliminated altogether if two or three car loads of skilled officials tested the running against time without warning several times a day. With a sufficient number of smart officials, and large number-plates, card-signing becomes gratuitous.

The replenishment supplies might be very simply improved. Funnels could be provided, and measuring done away with altogether by charging each competitor a fixed sum, depending upon the weight and capacity of his machine, for his week's fuel, and closing the yard to all non-competing machines. I hope further that steps will be taken to prevent competitors utilising garages and repair shops; last year the Harrogate repair shops worked early and late, because no attempt was made to enforce this rule.

PRACTISING FOR THE T.T.

A. H. Alexander, the young Scotchman who rode a water-cooled Rex in last year's Senior Race, and will this year ride a 3½ h.p. two-speed twin Indian. He is seen negotiating Quarter Bridge.

A LADY NOVICE'S TRIP TO NEWCASTLE.

WITH a fortnight's experience of motor cycling and motor cycles, I started alone on a tour from Macclesfield to Newcastle-on-Tyne and back. It was a dismal Friday morning, and many unpleasant prophecies of relatives rang in my ears as I set off at 10 a.m., but after the first dozen miles, over known roads on top speed, all these were forgotten. Monksheath, Chelford, and Knutsford flashed by, and I had visions of reaching Newcastle that same day; but this happy state of things did not last long.

Outside Warrington, with a spasmodic jump or two, the engine stopped. I had not the vaguest idea where the trouble lay, so I just sat in the hedge and tried to recollect all the theory I had learnt during the last fortnight, but the stray bits that memory recalled were of no avail—I could not locate the trouble. A passing motorist came to my assistance, and yet another did his best, but both were nonplussed, for everything seemed in excellent order. Then another—bless him!—came along, and diagnosed "No petrol." By this time I felt about as tall as sixpennyworth of coppers, and I very meekly followed my guide to his own garage, where a new store of petrol set me once more on my journey. With a tut-tut-tutter I started for Preston. The roads here I found not so bad as they had been painted to me. The setts in Chorley *might* have been worse; anyway I managed to retain my seat.

Preston I reached at one o'clock, and stayed there to visit friends, so it was five o'clock when I resumed my journey. To Lancaster seemed a very short distance; the road is a glorious one, and I again tried top speed, but, thinking of the speed limit, I regretfully throttled down. Great was the interest my mount excited, and innumerable were the questions asked about it.

The writer, Miss Gertrude Gordon, and her 2 h.p. three-speed Humber.

About 6.30 p.m. I reached Lancaster, where I stayed the night, having no intention of travelling after lighting-up time. I had done over seventy miles, but was not at all tired, so after a good tea and supper combined and a much-needed wash, I attempted the sights of the town.

Fine Scenery and Hilly Roads.

On Saturday morning I started from Lancaster at 9.30. A kind policeman directed me the wrong way, but eventually, after much meandering, I reached Kirkby Lonsdale. It was a lovely day, and the scenery round was magnificent: on the left the sun glinted on the long slopes of the Cumberland Hills, and on the right the clouds dispersed on the dark tops of the Pennine Chain. All the time I travelled on my second speed, promising myself top speed later—always later. I was fairly among the hills, and although the machine was driven in a shockingly amateurish fashion, every hill was taken without a hitch or falter.

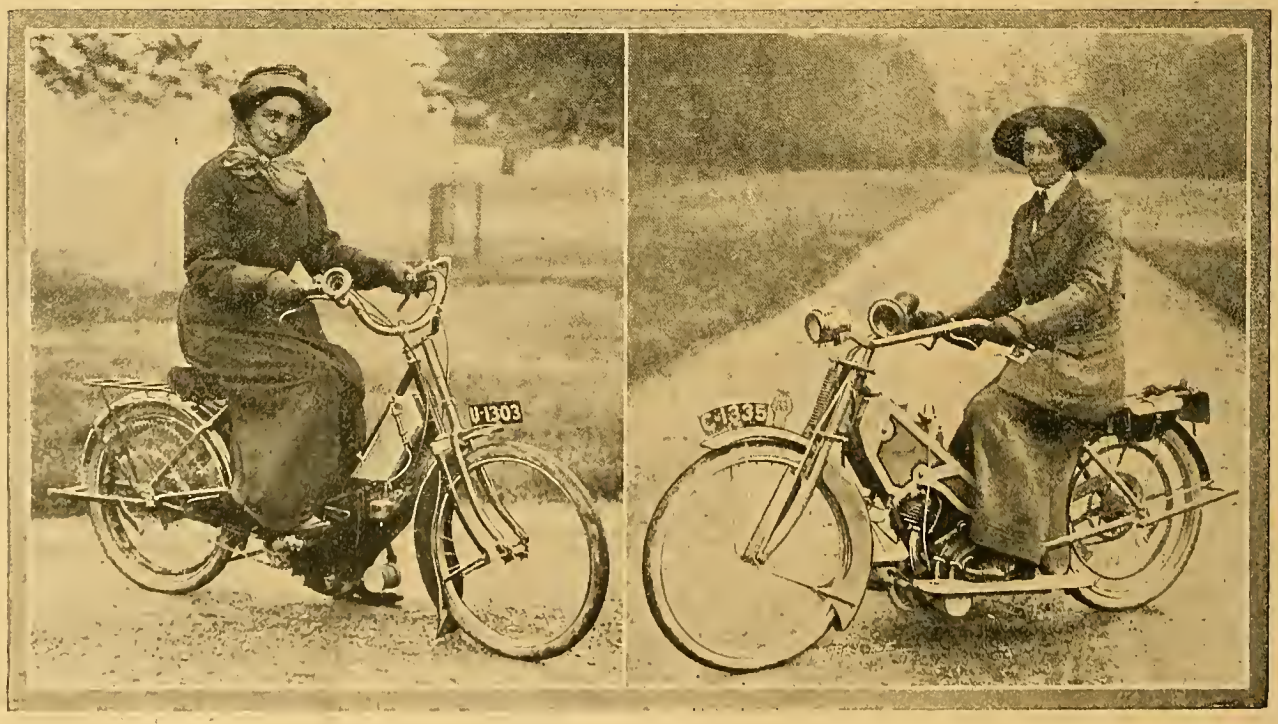
At the Devil's Bridge, outside Kirkby Lonsdale, I missed the turning and took a fearful road, greasy and hilly, and, to my misfortune, continued for a mile before I discovered my mistake. This part of the journey is very vividly impressed on my mind. From Sedburgh the road practically winds through the

Miss Holdsworth, of Wakefield, Yorks., who, though young in years, is a skilful manipulator of her 2½ h.p. two-stroke Levis.

A Lady Novice's Trip to Newcastle.—

Pennines up the valley of Ravenstondale, but my motor cycle was running beautifully, flying along the level, and not toiling up hills.

At Brough I again took a wrong turning, and went miles out of my way. Then through Brough over moorland tracks that were not too bad for motor cycling. Up every hill went my little Humber, on top speed now, for I could see signs of not reaching Newcastle-on-Tyne by lighting-up time. With a wind behind that added another h.p., I flew along. It was grand! After Barnard Castle all my faculties were concentrated on the milestones flying past. Of Darlington and Bishop Auckland I have confused impressions of a crowded market place, with much dodging of slippery cabbage leaves, and of a tremendous hill; but I really cannot now distinguish which was where.



Outside Auckland I rounded a bend and found myself in a pond which stretched right across the road. There was a foot bridge for cyclists and pedestrians, but I did not see this in time. My skirts got wet and the cylinder spluttered, but nothing more exciting happened. On went my gallant little steed. The finger posts now hinted at a remote Newcastle, and my whoop of joy can be imagined when, at Neville's Cross, a definite "Newcastle 18 miles" came into view. This way I skirted Durham. When two more milestones had been passed I discovered that I must return to Neville's Cross garage, for in my haste and excitement I had ridden away without paying for a refill of petrol.

An interesting 2 h.p. lady's lightweight, built with a Moto Reve engine and special low frame. The machine weighs just under 100 lbs., and the saddle is supported on a spring pillar. The owner is Miss Ethel Drury.

At Birtley there was a procession, or football match, or meeting of strikers, or something, which necessitated the whole population turning out, and, to my embarrassment, I received a great amount of notice. Many people ran after me to see my machine mount the hill out of the town, and I nearly spoilt the ascent by again badly manipulating the levers.

Perhaps lady motor cyclists in the North are few, for at Chester-le-Street and Gateshead the same lively interest was evident. Once Gateshead was reached the very tramcars said

YORKSHIRE LADY MOTOR CYCLISTS.

Mrs. Hinchcliffe, of South Hemsall, with her 2 h.p. Motosacoche. Miss Andrews, of Ackworth, who rides a 2½ h.p. Enfield

A Lady Novice's Trip to Newcastle.—

"Newcastle," and I was so excited that I hardly knew whether I was sitting or standing on the saddle. My one idea was to rush and wire home, "I've arrived." When I reached the Tyne bridge the traffic was rather congested, and, just as I thought I was fairly through, the hand of the law stopped me. Again I was unconsciously cheating, for there is a halfpenny toll to pay before crossing. Through countless pockets I searched for the required coin, while pedestrians were amused, the policeman annoyed, and 'bus drivers angry at being kept waiting. Then, not being too familiar with the working of my free engine clutch—and because he looked so annoyed—I mildly suggested to the big policeman that he should push me off. His look of offended dignity haunts me yet. To save the situation the gatekeeper ran out and officiated. Then across the bridge, through the market place and Grainger Street I rode, and handed in my triumphant wire, "Arrived here on the motor cycle 6.30," and so on to pass a happy week with my friends.

The Journey Home.

The return journey was quite tame compared with the outgoing one. I had decided on the eastern route through the Yorkshire towns, and started from Newcastle on Saturday morning at 11.30. At Chester-le-Street, in trying to manipulate my skirt, I tumbled off and lost about two inches of skin in the argument with the ground, but reached Durham without further mishap.

Here I found myself in the open market place, but had not much time to note its quaintness, being busily engaged dodging stalls and stray cabbage leaves. In hunting for the usual market finger-post I unearthed a policeman, and he set me on the rocky road to Ferryhill, little better than a cinder track.

Northallerton I passed through, and on to Ripon. When only a mile from this town the petrol gave out —this time I knew what was the matter—it was lucky I discovered an injector full of petrol in my pocket, and this amount took me into Ripon. After a delayed lunch and a walk round the town, I started for Bradford, and had only proceeded 100 yards when a sudden stoppage occurred. A multitude of small boys rushed from near and far, but they were disappointed, for after a momentary examination I found that the petrol had not been turned on.

Miss Downie, who rides a twin Forward, is an occasional competitor in the Edinburgh M.C.C. Trials. Her brother (also depicted) is an Ariel rider.

Bad Roads and Setts.

Through Harrogate, with its stiff hills, and on to Shipley I raced. Bradford I reached a little before five o'clock. As it was Saturday the traffic was rather complicated, and so it was 5.30 before I was comfortably going along the Manchester Road to Huddersfield. From now until Oldham was passed I had the greatest difficulty to keep my seat. The setts were something dreadful, and consequently the jolting terrific. At Oldham I stopped for petrol, and such a crowd gathered round that the police had to come and order a "move on."

Manchester's Saturday evening crowds safely through, I started with joy on the last lap, and reached home at eight o'clock, tired but triumphant.

I must add a tribute to my Humber motor cycle, for I was such a raw novice that the machine practically took itself—I merely guided it—and from start to finish I had not the slightest trouble with it. In traffic I had no fear because the cycle is so easily manipulated, and I think that any lady able to ride a push cycle could mount and ride my motor cycle straight away. G.G.

Miss Muriel Hind and the 6 h.p. twin Rex on which she has successfully competed in recent hill-climbs. This intrepid lady rider has ordered a new Rex which she is entering for the Irish End-to-end run, and the Scottish and English Six Days' Trials.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

WHO WILL WIN THE TOURIST TROPHY RACES?

By MICHAEL KIRK.

ARE we going to recover the ashes? Will the graceful figure of slender silver adorn Madison Square Garden or Olympia next winter? Such is the question which is agitating all motor cycling circles just now and investing the racing with such vivid interest, despite the enforced absence of many cracks under the manufacturers' bond. The answer is duplex in nature, and resolves itself into the double-barrelled query, "Can any twin expect to beat the Indians?" and "Can a twin win at all?"

A Weakened Indian Team.

The chapter of accidents is all in favour of a patriotic answer, for the Indian team is distinctly less formidable than it was in 1911. The same machines and engines will be used again with a shortened stroke. Of the riders, poor Moorhouse (third last year) has gone to his rest, and Jake de Rosier (a peril wherever he rode) is lying in hospital at Los Angeles. The honour of the Stars and Stripes will be upheld by Godfrey and Franklin (first and third on time in 1911), J. R. Alexander (eighteenth in 1911), A. H. Alexander, whose last year's machine let him down in the second lap, and J. F. Sirett, who was outed by tyre troubles after a fast-opening lap with his N.S.U. in the 1911 Junior T.T.

Three of these riders have yet to prove that they are tip-top men, so that the main onus of retaining the ashes seems to rest upon Godfrey and Franklin, the former being the more formidable, for he is a born race-winner if ever there was one.

The Twin-cylinder Opposition.

Against this depleted team on America's best, we can pit much the same twin-cylinder strength as last year. Both Colliers are riding, and C. R., naturally the more daring speed-merchant of the two, will not get entangled in the rules a second time, while H. A. can drag extra speed out of himself if any mishap throws C. R. behind him. These dauntless brothers do not appear to be subject to the laws of age and chance as other men are, and they, as usual, will be hard to beat. Mason, the Matchless third string, was a slowish fifth on time last year, but for a *début* his performance was a sheer miracle. He has more experience behind him now, and is taking an exercise canter in the Junior.

Behind this trio come H. H. Bowen (Dot-Jap) and W. H. Bashall on another new mount—a Matchless. Of this pair I used to think that if they could add a modicum of restraint and caution to their unparalleled dash and devil, they would have the finish to themselves. I must confess I have lost hope of Bowen; I question if he has the race-winning temperament. He may lead at half-distance, steadied by years and the approach of matrimony; but I fancy that after a lap or two the old devil will blaze out again, and a reckless corner will once more put him out. Harry Reed has years of experience, and once got home first on a twin. Yet on the whole I think a Collier is more likely to be the fastest twin rider.

The other twins include Holder and Perryman on Blumfields and two Scotts. I should not be surprised if every twin that starts finishes, but I regard the Scotts as the only potential victors in the tail. The Scotts rank as perhaps the very fastest machines in the entry, and their riders are worthy of them. Frank Philipp is in the absolute top flight as a rider, and given a no-trouble ride might win hands down. Applebee was once on the same mark as Godfrey, but he has not enjoyed the same luck, nor has he had such fast machines to ride. If the two-stroke engine can live the pace without giving any trouble at all, the Scotts might head the list, but it has not been "tried out" as thoroughly as the four-stroke.

Applebee's machine gave him trouble of one kind or another in four laps last year, and his other lap was speedy. Philipp put up a record lap before his engine gave up the ghost.

Now we reach the real crux of the race, which I can

Who will Win the Tourist Trophy Races?—

demonstrate by saying that if Jack Marshall were still in his prime, and bestriding a three-speed Triumph, I should plump for him with three stars to win comfortably. For the first time singles and twins are under the same cubical capacity limit. Last year the slight vantage allowed the twins in engine dimensions was partly responsible for Godfrey's licking the speediest single by 20m. 39s. He was only 6½ seconds per mile faster than the leading single.

Moreover, these figures flatter the twins. Not only were the twins given the advantage in engine dimensions, but the best singles encountered a curious amount of trouble, which soon deprived the best single jockeys of all hope of victory; and further, a most regrettable and obscurantist policy entered the fastest and most reliable singles on single gears. The four fastest singles in 1911 were handicapped by single gears, and were penalised in engine size, while the luck of the day brought several petty troubles to the best men who had elected to ride on singles. If a single-cylinder jockey of the first-class enjoys the same luck as the fastest jockey on a twin, nothing can beat him.

Which is the Most Dangerous Single-cylinder?

Unluckily Carvill, who headed the single-cylinder placings last year, has not entered, and Lister Cooper, W. F. Newsome, F. C. North, and B. V. Jones, are not competing. On the book Quintin Smith (8th in 1911), J. R. Haswell (17th in 1911), and J. W. Adamson (4th in 1910), are the most formidable to the twins. None of these, in my opinion, can carry a favourite's confidence. One or two twins ought to beat this pair, though both should finish close up.

Among the newer men we must not forget Hart-Davies. He has weight and *anno domini* heavily against him, but he knows the Triumph engine inside out, is an excellent cornerist, and has more experience of speed work on the road than most men. My doubt about him is whether he can learn at the first essay to average the 50 m.p.h. requisite for victory in the T.T., when all his training has been aimed at an average of 15 or 20 m.p.h. less. He is just such another as J. W. Adamson; the pair are pretty certain to finish, and to finish well up; but younger men may bar them from premier honours.

David Bolton on the Rudge is another magnificent tuner and saddle-sitter, and quite likely to break the lap record. Both he and the Rudge Co. have, however, been unfortunate in the T.T. Race, and I can only wish them better luck this time. If the Rudge is as good in the T.T. as it has been at Brooklands not many will show Bolton the way home.

Now we come to an eloquent mystery! Why is Newman, our hill-climbing crack *par excellence*, not in the Senior race? He is entered for the Junior, and he has a very fast 500 c.c. machine, yet his name is missing from the Senior entry. If Newman had started he would have been a glad draw in any sweep, and might have been made a favourite. Woodhouse, who is riding in the Senior on a Regal machine fitted with an overhead valved Precision, may prove to be the real surprise packet. Further down the list we spy the Singer, which has terrific speed; can it last, and is Mundy smart enough to get it home at the top? Behind this fleet come a host of dark horses, whom nobody expects to win, but, as I said last year, it is high time by the law of averages that a 100 to 1 chance romped home, and nobody would be dumbfounded if for once the veterans play second fiddle.

Summary.

On the whole I expect to see the fastest, luckiest, and best-ridden Triumph win by a slight margin, hunted home by one other single-cylinder, which might change places with it if the Triumph luck is poor. Behind these I should look for a small bunch of twins, including one Matchless and two Indians.

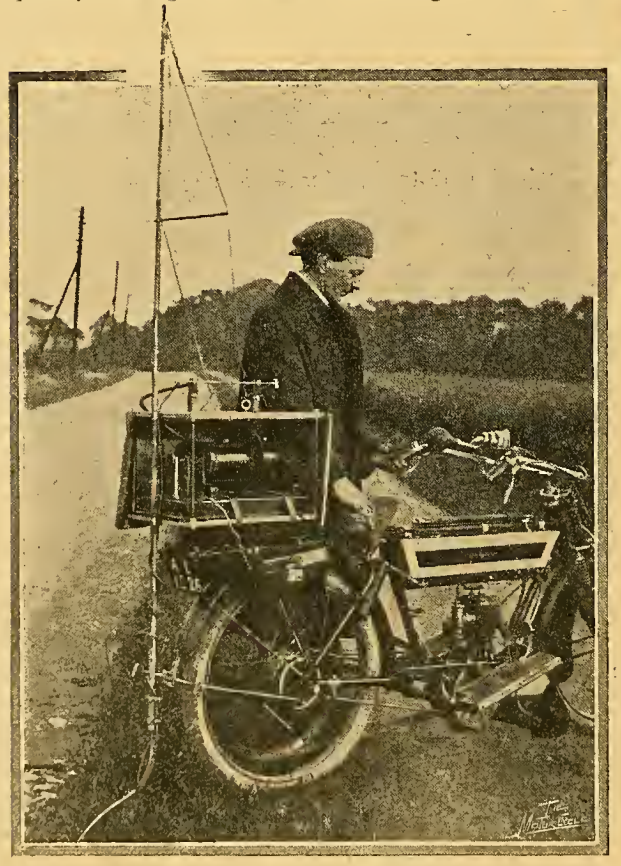
Surprises are most to be expected from Mason, a Scott, Hart-Davies, Bolton, or—especially—Woodhouse. I can only fancy Charlie Collier's chances if all the fastest singles meet petty troubles; though he is facing four good Indians single-handed (since H. A. is slower than he is), I think he only needs a clean run to hold them beat, for he has more experience than Franklin. C. R. is up against the stiffest proposition of his racing life, and he will deserve a terrific ovation if he win through.

The Junior Race.

Prophecies of the Junior Race are indeed "wrop in mistry." There are plenty of dark horses, but the quality of the known men is too good for an outsider's victory to be seriously expected. P. J. Evans should start favourite, and his runaway win last year on the Humber was tremendously convincing. First and foremost he has got to beat Newman, the best road sprint man in England to-day. If the change-speed gear on his Ivy-Precision stands up (this is its racing *début*) and Newman's stamina is equal to his devil, we need look no further for the winner. Then there are five Douglas and five Humber machines on the list. These are *par excellence* reliable medium-weights, and a sample of the Douglas did 56½ miles in the hour on Brooklands the other week, so that Kickham and Bailey have actually had the impudence to challenge the big machines in the Senior event. There is a tone of healthy confidence about this policy, and the Australian, Bailey, is undoubtedly a terror.

H. J. Cox, too, who finished third on a Forward last year, must not be overlooked. Hugh Mason will nonchalantly regard the ride as a picnic after his experience in the 1911 Senior, but who knows the capabilities of his "$2\frac{3}{4}$ h.p. Newcastle-on-Tyne"? The Alcyon is a fire-eater, and Slatter is not the man to let it rust under him.

W. Creyton will be out on a Humber, and will be sure to ride to finish as a placed man; he is on his native heath in the Island. The Singer trio are known to be as fast as the wind, with Mundy the probable leader. Any of the entry might win if misfortune overtakes Evans, Newman, and Bailey. I plump for a furious duel between Evans and Newman, with Bailey, Mason, Slatter, and Creyton close up.

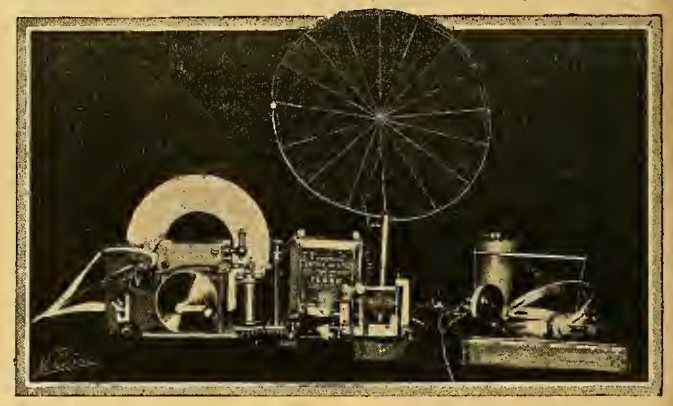


The Basballs (J. T. on a Humber and W. H. on a Douglas) might create a surprise, but I question whether either of them can yet be as "*au fait*" with a small twin as they are with a big J.A.P. The openness of the race consists in the limited numbers of the real class cracks engaged, and, with Evans and Newman outed, it might be a real lottery. In any case it will provide a zestful "*hors d'œuvre*" for the big race on the Monday.

Wireless Telegraphy on a Motor Cycle.

A FEW PARTICULARS OF A SUCCESSFUL EXPERIMENT.

SOME experiments have been made by Mr. G. F. Campion, of the Campion Cycle Co., Ltd., Nottingham, in sending messages by wireless telegraphy from a motor cycle in motion, with very successful results.

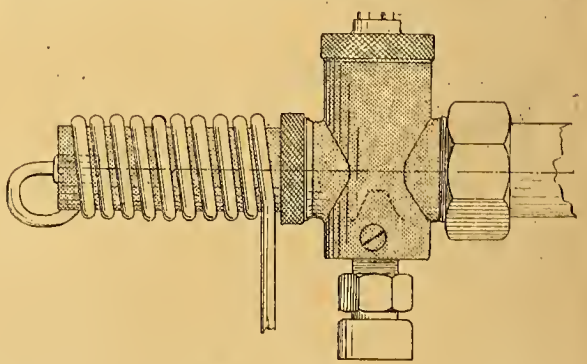


Naturally the transmitting apparatus, which is attached to the carrier of the motor cycle, has to be of the simplest possible nature, also while the machine is being ridden the aerial must be strictly limited in height, but as this is adjustable, being, in fact, composed of a certain number of lengths of fishing rod, it can be lengthened when the machine is stationary, and consequently messages can be sent to a greater distance,

G. F. Campion and the wireless telegraphy apparatus attached to his motor cycle.

the height of the aerial being one of the determining factors of the space which it is possible to cover. It is obvious that when the rider is on the move a tall attachment is out of the question, because it might foul the branches of trees, telegraph wires, or any overhead obstruction, and cause an accident. A message was successfully sent from Loughborough to Nottingham while the machine was travelling at the rate of thirty-five miles per hour, a distance of about fifteen miles. This is quite sufficient to prove the practical use of the instrument, though it is by no means its limit. We understand that messages have been sent as much as thirty miles.

Of course, as a motor cycle runs on rubber tyres and is thus insulated, a special earthing contact is



The receiving apparatus.

required. This is clearly shown in our first photograph, in which the transmitting apparatus can be seen fitted to a Campion motor cycle; the earthing contact trails behind, and is kept firmly pressed against the road surface by a spring. Our second illustration shows part of the receiving station.

The many uses of such a contrivance will be obvious to anyone, and we need not enlarge upon them here. The possibility of sending messages in this way will be of immense use in military work, such as scouting, etc. Also, in days to come, our reporter in the T.T. races and other events can record his impressions still vivid in his mind while actually following the competitors: thus an account can be in print almost as soon as the event is finished!

THE MARTIN AUTOMATIC EXHAUST PRESSURE PETROL FEED.

The accompanying illustration renders this ingenious device practically self-explanatory. The exhaust gas enters a spoon receiver inside the exhaust pipe, passes through four coils, then through ten coils round the main air intake and enters behind the jet, helping, so the inventor claims, to vaporise the petrol and greatly increasing the air draught. By the time

the exhaust enters the air intake it is practically cold. It might be thought (at first sight) that the exhaust gases would interfere with the carburation, but we hardly think that the latter would be affected, as there is a large amount of air rushing in behind to nullify any evil effect there might otherwise be.

Five up Edge Hill on a Rex Sidette.

Hill-climbing Extraordinary.

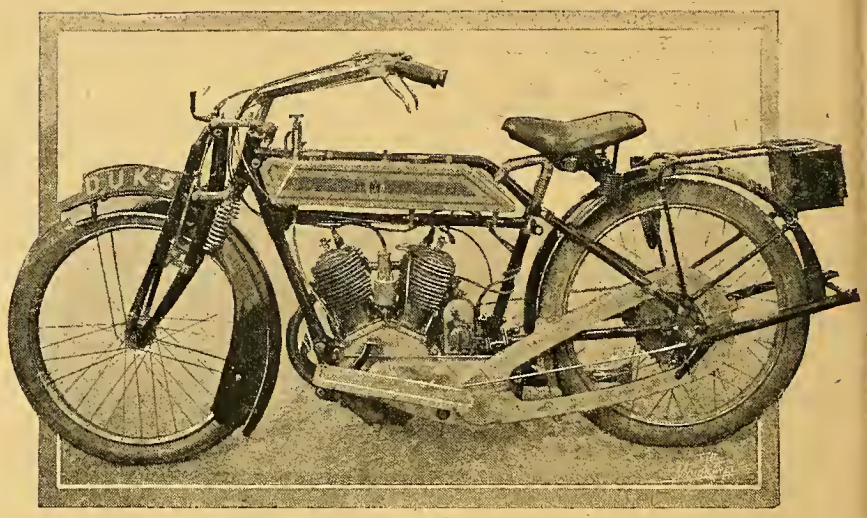
QUITE a happy little band of sidecarists assembled at Edge Hill, Warwickshire, last week, the why and wherefore being a demonstration of the hill-climbing qualities of the 6 h.p. Rex Sidette. We were proffered a model of that brand for our journey to the hill, and accordingly tacked on to a fast moving line of sidecars *viâ* Kenilworth, Warwick, Barford, Wellesbourne, Friz Hill, and Kineton. Though fairly severe there is nothing on this route to tax the energy of the latest Rex. At Kineton there was a council of war as to the first demonstration of the general advance made in Rex machines—for such was the purpose of the outing. We were six sidettes and two bicycles all told. There were Mr. and Mrs. Hall, Mr. and Mrs. Lloyd, Mr. and Mrs. Geoffrey Smith, Miss Muriel Hind in R. Lord's sidecar, Mr. Guest, Mr. Edward Gorton, our photographer, and three assistants from the works.

R. Lord climbing Edge Hill with four passengers—five in all. Three days later he made the first ascent of Bwlch-y-Groes, Dinas Mawddwy, with a sidecar and passenger.

Edge Hill is approximately four miles from Kineton - we suggested that an attempt should be made to climb this noted 1 in 7 acclivity on the run with hot engines. Accordingly we set out first, and having reached the hill summit without real difficulty, despite a top ratio of 4 to 1, we turned to watch the performances of the others. Suffice it to say that five of the six got to the top at the first attempt, Lord using his high gear most of the way. It was clear, therefore, that Edge Hill was quite an ordinary test for a 6 h.p. Rex, so some extraordinary method of determining what a Rex could not do had to be resorted to. Four passengers were suggested, so Dick Lord tried his luck and got to the top so easily and without the engine showing signs of distress that still another passenger was piled on board. With the low gear engaged he commenced the climb with a human freight of no less than 57 stones 5 lbs. Slowly the machine progressed upwards, but never once did it falter, and Edge Hill is no child's play, for it is quite threequarters of a mile long. If doubt ever existed in the minds of anyone regarding the pulling powers of the 1912 model 6 h.p. m.o.i.v.-side by side valve Rex, this performance should banish it, and the feat must rank among the best exhibitions of the kind to date. It might further be added that Lord's machine is not abnormally low geared, but is the same two-speed machine on which he has competed in nearly all this year's long-distance reliability trials.

The Rex party at the Round Tower at the summit of the range of Edge Hills.

The Riders of Solo Mounts.



An interesting change was provided by Miss Hind making an exhibition climb on her 6 h.p. hill-climber. She rounded the bends in most fearless style, leaning over at a great angle, and finally flashed over the top at over forty miles an hour. Phew! This was speed with a vengeance! We very much doubt if any lady has been catapulted up Edge Hill in quicker time. Though our views may differ on the subject of ladies racing, we take our hat off to Miss Hind as the most skilful and daring lady motor cyclist in the country.

Next to the front was the latest production of the Rex Motor Manufacturing Co., viz., a 6 h.p. chain-driven model, with neat aluminium guards above and

Five up Edge Hill on a Rex Sidette.—

below the chains. The chain from engine to counter-shaft is completely enclosed. This machine made light work of Edge Hill on top gear, and we ourselves rode the machine up, never once dropping below 30 m.p.h.

The party having satisfied their hill-climbing mania without succeeding in putting any of the machines out of commission, a move was made to the Round Tower for tea. How delightful it was that lovely June afternoon—a refreshing *al fresco* tea, magnificent views all along the range of Edge Hills, of the Vale of Evesham, Bredon, and Malvern Hills, and home again refreshed in body and mind, with a firm conviction that the present year's Rex is streets ahead of anything we have previously sampled of that make.

NEW CHAIN-DRIVEN REX. The mount illustrated is the first of the new type 6 h.p. chain-driven Rex twins. The front chain is entirely enclosed, the rear chain having aluminium guards top and bottom. This model is an addition to the belt-driven type.

ENGLISH-DUTCH RELIABILITY TRIAL.

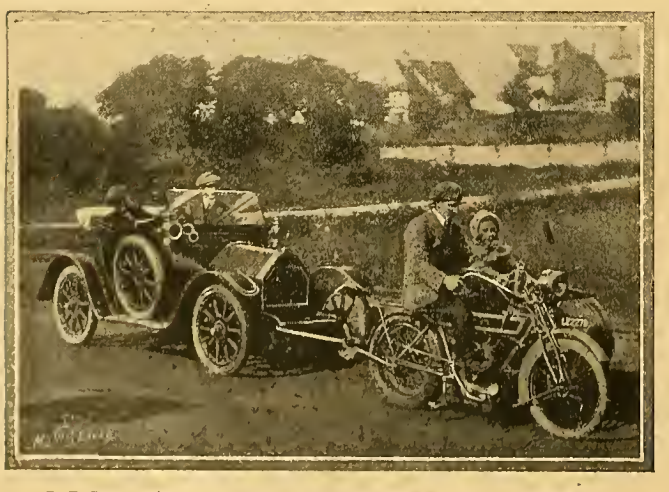
THE regulations governing the above international contest will shortly be issued to the competitors, and before the end of the month the hon. secretary of the Dutch M.C.C., Mr. A. Citroen, promises to forward the route cards, number plates, and the exact programme of the "feasts." The Dutch Club will offer to the British team on Saturday, August 3rd, an official dinner in Amsterdam. Next day, which will be spent at Scheveningen, the noted bathing place, there will be an official reception and tea by the president of the Dutch Club, Mr. Rob R. toe Laer.

Monday, August 5th, is the day of the international trial, which starts and finishes in Amsterdam, distance 160 miles.

Tuesday will be spent at Volendam, the well-known fishing town, where there will be an official lunch to the thirty-six competitors, the representatives of *The Motor Cycle* and the Dutch M.C.C. by A.N.W.B Touring Club of Holland.

Special arrangements are being made with regard to the transport of the competitors' machines from Harwich to the Hook, and it is hoped to reserve accommodation at the official hotels in Holland.

It is interesting to know that Dutch entries, though tardy at first, are now sufficiently numerous. The class with the least support was the 500 to 1,000 c.c. trade class, but now there is a Cyclonette, a Coronamobil, and a Phanomobile among the entries.



To avoid any possibility of the English team having to start with depleted ranks, it is hoped that two reserves in each class will accompany the teams.

Gordon B. McKechnie informs us that, owing to a fall he sustained in the London to Edinburgh run, he will not be able to attend business for the next six weeks, and therefore will not be able to act as a reserve. The next rider is H. Wallis (Bradbury).

W. H. Wells also finds he will be abroad at the time of the trial, so a reserve man is wanted in his class. R. Lord (6 h.p. Rex sidette) is the chosen rider.

A WEEK-END EXPLORING EXMOOR

Some Notable Gradients Discovered

By L. W. Spencer

HAVING recently taken delivery of two 1912 three-speed Rovers, my chum Brooking and myself decided to spend a week end in North Devon testing their capabilities and exploring the country.

The charming and romantic stretch of moor and coast between Porlock and Ilfracombe was the district chosen. Our headquarters we decided to make at the excellent little inn known as the Blue Ball, Countisbury, situated on the edge of Exmoor, overlooking Lynmouth and the sea.

Starting from Uxbridge at ten o'clock on Friday morning, I picked up my chum at Bath, and made off for the West. Leaving Bath by the Wells Road, we turned off over the Mendips and dropped down through the famous Cheddar Gorge to Axbridge. A fast and uneventful ride followed through Highbridge, Bridgwater, and the outskirts of Minehead to Porlock. Here we expected the fun to commence, as we meant trying the famous Porlock Hill on the run, and we had not touched our gears since leaving home. My low ratio was just over 7, and Brookings just over $6\frac{1}{2}$ to 1.

Through the village we hummed; past the old Ship Inn and the Toll Gate Road, which holds so many humiliating memories of the past—including our own!

Porlock Hill on the Run.

Through the trees the old hill seemed to be grinning down at us—thoroughly amused at the idea of being taken on the run by a $3\frac{1}{2}$, or, as some might put it, be "caught bending" after having caught so many on the "bend." Still, nothing daunted, on we went, and popped the low gear in as the first corner appeared.

W. B. Gibb (Douglas) on the second corner of Porlock Hill. In wet weather the surface is covered with thick clayey mud.

Round we swung, wondering whether that corner would ever end. Still the engines never faltered, and in a few seconds we were on the bit of straight road above. Another 200 yards and the road suddenly disappeared again, this time to the left. Round again and what a bend! Still on we went, steadily, surely,

The hairpin corner on the "easy" road to Ilfracombe from Lynmouth *via* Beggars' Roost. A fresh start can be made from a lane to the right.

triumphantly, climbing this terror of the West. A little more and we were up the worst, and then with middle gears in soon reached the top. We pulled up and smilingly shook hands, for Porlock taken on the run with hot engines and home touring gears wiped out many an old defeat.

We were now in the heart of the worst part of the forthcoming Six Days' Trials country, and I might add a note here in reference to the section we had just traversed from Bath to Porlock—not only for the benefit of competitors, but for those who will probably be running over the course before the trial.

Great care should be exercised in descending Cheddar Gorge. There are several very bad S corners—particularly one on the steepest part which sweeps round to the left. To ride this correctly, and if there is much traffic about safely, needs more than ordinary care. The tendency to over-ride the corner and shoot over to the right is almost overpowering. Sidecarists going down here for the first time should make a special note of this.

I should very much like to see the A.C.U. award marks for cornering. There are shoals of motor cyclists on the roads who know nothing about correct cornering, and they are a danger to everybody. The A.C.U. could not get a better place than Cheddar Gorge to experiment in this way.

A Week-end Exploring Exmoor.—

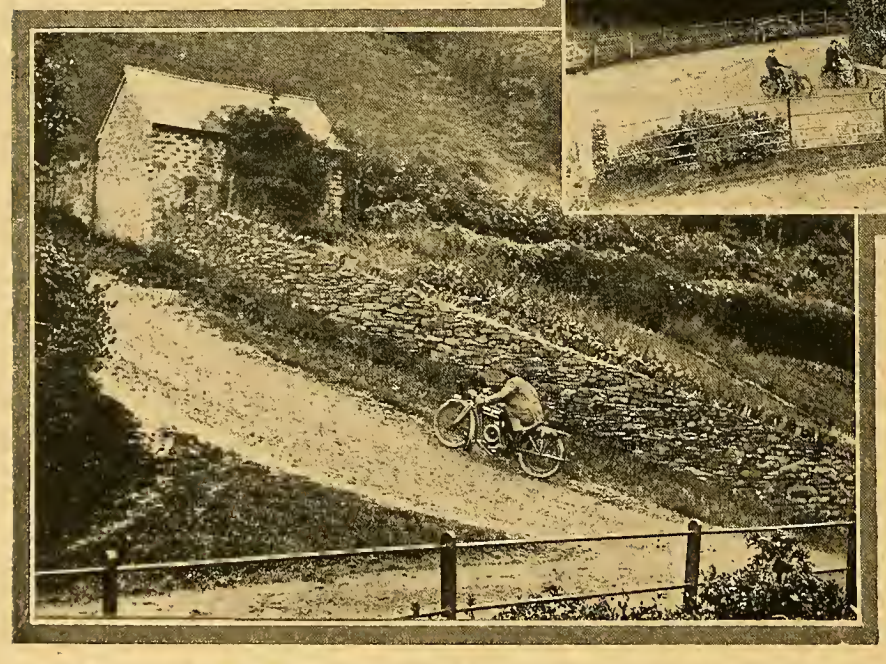
Care should be exercised about two miles from Minehead, as there is a horrible little hump-back bridge on the main road from Bridgwater just opposite the castle which will be noticed on the left. If anybody goes "mopping" over this (*i.e.*, the bridge) all out there will be trouble. Anything over thirty means both wheels off the ground, and that funny "lift" feeling as you come down. The A.C.U. would do well for everyone's sake to erect a special caution board here.

Men "sampling" the district should note that the town of Minehead can be avoided by taking the left turn to Porlock about half a mile from Minehead.

As to Porlock itself one's advice all depends on weather and conditions. If it is dry and the surface good the first corner to the right should be taken wide on the left, and the second in the centre, keeping a nice steady jog between them.

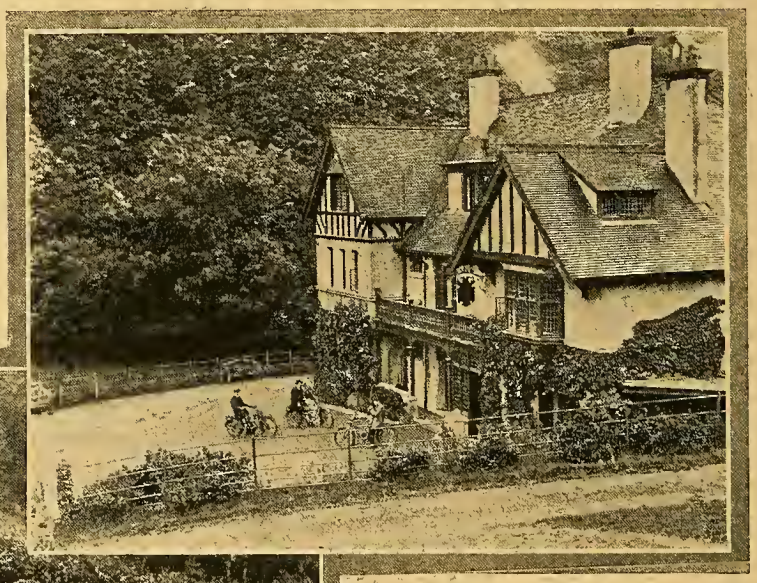
It is useless "rushing" anywhere. The corners cannot be taken at speed, and it will simply be heating up engines to no purpose.

If the hill be wet it is next door to being unrideable, and the greatest skill and care will be necessary.



The first corner should then be taken close in on the right and the second corner close in on the left all the way round as near the gutter as you dare go. Don't let the machine shoot out to the right after the first bit of the second corner is taken.

Above all things beware of the slime, and have the finest and newest non-skid on the back wheel.



If dry the ordinary rider will find a 3½ h.p. very comfortable on an 8½ low gear.

If wet get the lowest gear the engine will stand—10 to 1 will not be too low, so that you can start anywhere on the clutch after a bad lurch without actually letting the machine stop. The three-speed hubs will be all right if 1in. belts are used, and special belt pulleys fitted which will screw out to the lowest ratio. Most of the ordinary pulleys will not do this, as the flange comes off before you get the bottom ratio.

Men riding the excellent Armstrong gear (as I do) would do well to insist, however, on a bigger back belt rim being fitted or the ratio of gears being altered, as it is cruel to keep the belt at the bottom of the pulley.

Mannicott Hill from Hunters' Inn. The road leading to the left is the coast road which will be referred to in the next instalment.

Hunters' Inn from Mannicott Hill.

After Porlock followed a short sharp run of eight miles over Exmoor, when we found ourselves at the Blue Ball, Countisbury, just after six.

I might put in a Six Days' hint here—mind the turns on this section and beware of sheep everywhere near Exmoor. They lie about like stones and dart right across the road through holes in the banks.

After a welcome meal, we lowered our gears for Devonshire work to a bottom ratio of just over 8 to 1, and slipped down into Lynmouth to try the famous Lynton Hill.

Our second surprise followed, as we soared up it without a falter and with nothing like full power on.

This is one of the "tit-bits" of the Six Days'. Fortunately for us it was dry and in fine condition, but if it should be wet it is worse than Porlock.

The first corner to the left should be taken wide on the right, and the wall on the right hugged all the way up.

Do not rush the first corner, but take it steadily and accelerate as you feel the engine bite. If it be greasy don't force the engine power too much. This is very important, as if too much throttle is put on the sudden acceleration will drag the machine over.

Mind your fingers do not get bruised against the wall.

In answering this advertisement it is desirable to mention "The Motor Cycle."

A Week-end Exploring Exmoor.—

After a fill up with petrol at 1s. 7d. a gallon, and a ramble round amongst the waterfalls and houses (which are all mixed up together), we lighted our lamps and essayed the climb up Countisbury in the dark. This

The writer climbing Station Hill, Lynton, on his 3½ h.p. Rover. The photograph gives a good impression of the gradient, showing Lynton below.

once dreaded hill we hardly noticed, and found we could start upon the clutch in the steepest part without fuss or trouble. In fact, of so little consequence did it seem that we went down for a bathe and up again before breakfast!

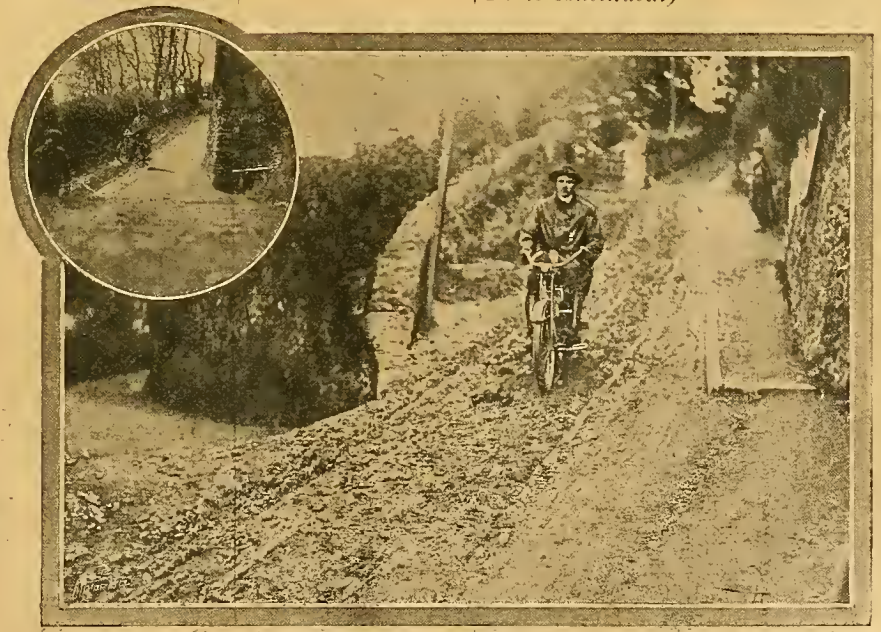
Countisbury Hill, however, is another that figures prominently in the Six Days', by which time the coaches will have cut it up badly. There is, however, nearly always a very nice little solo track on the left going down, and on the right coming up. Riders should hang on to this like grim death. If you get off this you are almost certain to be stopped. In ascending be very careful not to overshoot the first bend to the right. Take it very steadily on the throttle and keep close to the bank on the right.

Saturday gave promise of another fine day, and our programme was based upon a long cherished wish to explore the coast road between Lynton and Ilfracombe. This road, I had always been informed, was closed to motor traffic on account of its dangerous hills, corners, and surface, and its proximity to the sea. (All mere spice to keen motor cyclists!)

I knew quite well that the coast road going through the Valley of Rocks was closed by a lodge and gate. I had an idea, however, that by going round we could regain it.

First we went up to Lynton, and followed the road right round to the Valley of Rocks. Coming back again we regained Lynton Hill, and turned to the right up the Ilfracombe Road.

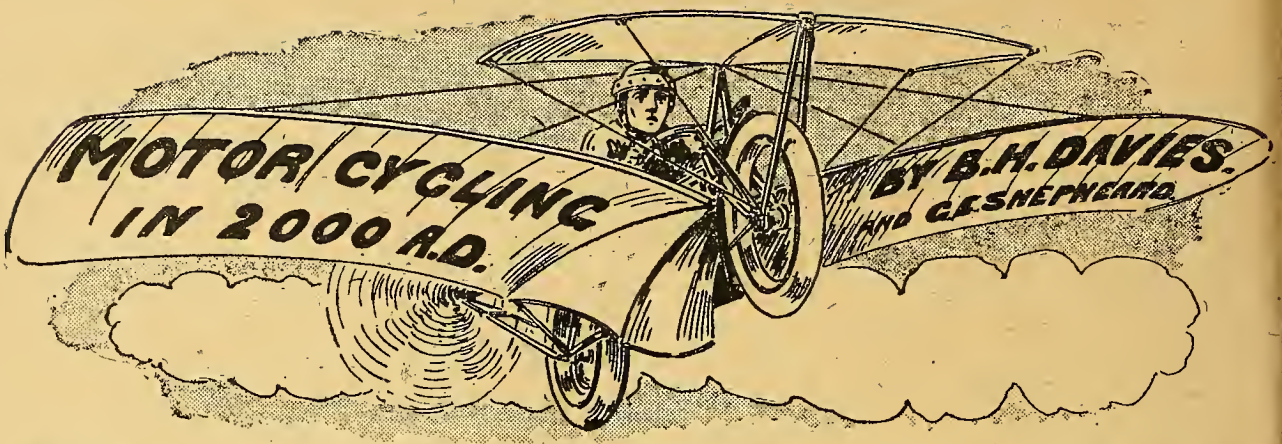
Beggars' Roost.



In a mile or so we reached Barbrook and took the sharp turn to the left between some cottages, when the famous hill appeared above us. Taking it in turn to watch the corner for traffic, as the hill *must be taken on the wrong side*, we made clean ascents at the first attempt. Beggars' Roost is, however, a real genuine teaser. Though it has no bad corners, it is more difficult to climb than either Porlock or Lynton. The gradient is awful and positively precipitous, though the hill is quite short, being only about a quarter-mile long. It was easily the worst we had tried so far.

It certainly ought to be in the Six Days', as it is doubtful whether there is a better test hill in the country. There are no bad corners, and the surface is better than Lynton or Porlock. If possible it should be taken all out all the way. There is the usual nice little solo track on the right. Be careful to keep to this at the first bend to the right.

Leaving Beggars' Roost, we returned to the Ilfracombe Road. I might mention that without a variable gear the majority of motor cyclists would have been unable to follow us up Lynton Hill, but there is a fairly easy way round to the top of Beggars' Roost by the Watersmeet Road out of Lynmouth, taking the turn about 3½ miles from Lynmouth to the right, where a signpost says "To Lynton and Barbrook Mill." Follow this lane right to Beggars' Roost, and thus gain the Ilfracombe Road. A warning must be given to those descending this hill for the first time. It should be taken with extreme caution.



This would make a very pretty alternative route in the Six Days' Trials from Lynmouth to Ilfracombe, which section is apparently to be included twice.

(To be continued.)

DESCENDING STATION HILL, LYNTON.

When the roads are wet and sticky, as on the occasion of the writer's visit, descents of Devonshire hills are often more exciting than the ascents.

THE *Morning Post* asserts that a French professional has "flown" a distance of 3ft. 7in. at a height of 8in. on a "winged bicycle" or "aviette." I ejaculate with Dominie Sampson "prodeegious!" I have "flown" much further on a push bicycle utterly devoid of wings. My best flight on a motorless bicycle up-to-date measured about 20ft. horizontally, and about 15ft. vertically, and any aspiring rider can easily equal it if he has the pluck. Suitable apparatus consist of a steep hill, a blood mare, a boulder, a bridge, a ravine, and a butcher's boy. Arrange the bridge over the ravine, and set both at the foot of the hill. The size and location of the boulder depend upon the limits of the desired "flight." When I set up my record, the boulder was about 1ft. in diameter, and was placed by the side of the road about 8ft. from the bridge. The blood mare and the butcher's boy are not absolutely essential, but in case the aviator's nerve fails him at the crucial moment when the take-off approaches, they have their uses. In my case the butcher's boy drove the blood mare furiously up the hill. The blood mare shied at my machine. In attempting to dodge the blood mare my bicycle hit the boulder, which was suitably concealed in brambles, and in company with my machine I described a graceful arc over the parapet of the bridge, landing somewhat heavily in the stony bed of the torrent beneath. Even as practised with a push bicycle the sport is a trifle expensive. Here is my bill for the solitary flight:

"I have flown . . . . on a push bicycle."

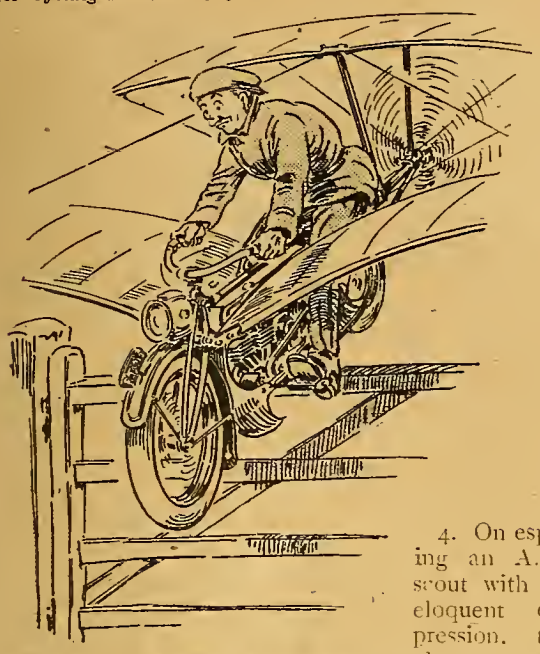
New Beeston Humber roadster, fifteen guineas.
Surgeon's bill, five guineas.
Loss of salary for four weeks, £20.

Owing to a limited income I have not yet essayed the sport on a motor bicycle, but I estimate that its costliness will rise in a ratio depending upon the speed and price of the motor cycle employed.

Many expert aeronautical engineers assert that the muscular powers of a human being cannot be so applied as to produce the horse-power requisite for sustained flights without the aid of at least a lightweight engine. These doubters would, of course, describe my own record and the French professional's petty *vol plané* as a "hop"; but the fact that the French Aero Club has offered a prize of 2,500 francs for the best flight, and that 198 entries have been obtained, looks as if two opinions on the subject were tenable.

The Auto-aviette.

I commend the notion to British designers, as possessing certain obvious advantages, and lest these should escape general notice, I beg to draw attention to one or two obvious superiorities of the winged motor cycle, which may be provisionally christened the auto-aviette.

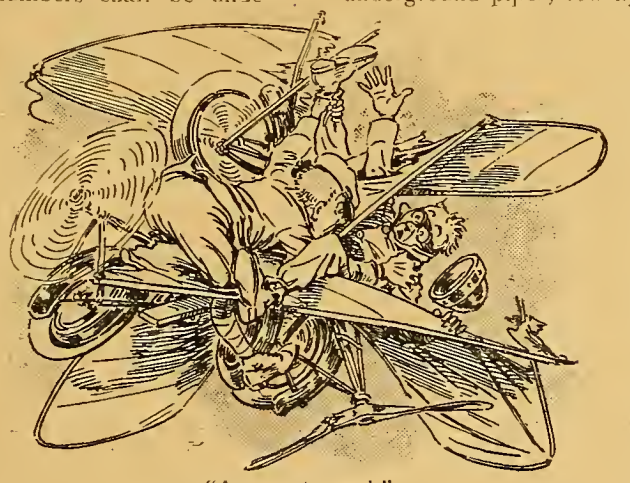


"The machine will pass over the police trap."

1. On sustaining a puncture, the auto-aviette's wings will be unfurled by operating a Bowden lever, and the machine will fly gracefully to the next garage.

2. On encountering a patch of dangerous grease or a stretch of unrolled metal, a short flight will instantaneously surmount the obstacle.

3. Hairpin bends will lose their terrors; instead of risking the dangers of "leaning the machine in and the body out," a hop of not more than fifty yards will land the machine on the straight immediately above the bend.

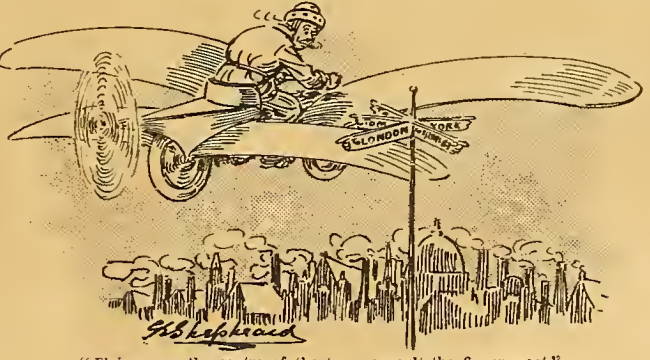


Motor Cycling in 2000 A.D.—

"A short hop . . . . . will nullify a tiresome obstacle."

4. On espying an A.A. scout with an eloquent expression, the elevator will be tilted, and the machine will pass over the police trap at such a height that its registration numbers shall be undecipherable.

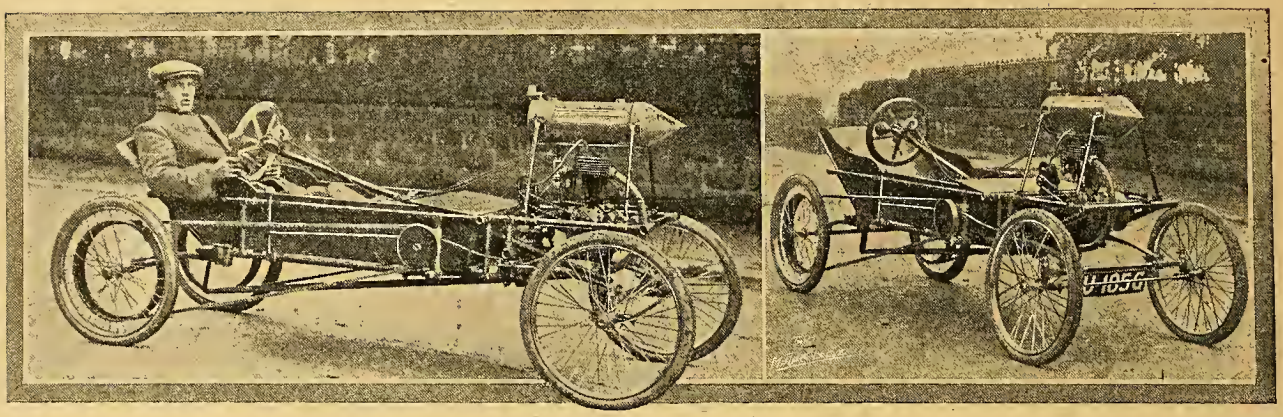
5. If, when taking your second-best girl out in the sidecar, you sight a female in the distance who looks suspiciously like the best girl, the entire outfit may be raised sufficiently high for the planes to conceal the sex and lineaments of your passenger; this procedure will avoid exhausting and tearful recriminations.



"A very pretty smash."

6. The opening of gates on the villainous mountain roads lately so popular with trials organisers will be completely unnecessary. A short hop on quarter throttle will nullify a tiresome obstacle.

7. A new rule of the road may be required to avert novel possibilities of accident under the new conditions, for should two auto-aviettes meet round a blind corner, and both simultaneously rise to the same height, a very pretty smash would follow. A precautionary rule could, however, simply be arranged. I am advising the Local Government Board to rule that "auto-aviettes going south or west hold the road in emergencies, auto-aviettes going north or east lift." Perhaps the new secretary of the A.C.U. will give the matter his best attention. I am ardently looking forward to the decrease of the cattle nuisance when I get delivery of my machine. Traffic stops in non-stop trials will no longer be a cause of friction.



8. No sane motor cyclist will in future trouble to thread city traffic. Without doubt each municipality will erect 90ft. finger-masts in some central position, and on approaching a centre of population we shall "lift," and flying over the centre of the town consult the finger-mast *en passant* as to our route onward. Tramlines may now be multiplied *ad lib.* without any opposition from us. Street improvement—a costly burden on the rates—may be abandoned, and historic cities may retain their narrow and picturesque streets without a tremor, for the benefit of American tourists and other back numbers. As motor cyclists will now eschew town riding, country inns and garages will profit and thrive on new custom, and the "back-to-the-land" movement will receive a great impetus, even if motor cyclists whose belts break in mid-air will interpret the phrase in a fashion quite their own.

9. This last consideration suggests certain warning counsels to the novice. While the auto-aviette removes many inconveniences which have hampered the development of the sport, it introduces a few novel perils. A fouled sparking plug, broken valve or slipping belt is a mere bagatelle on the road; in the air it is a breath-stopping calamity. Riders will be well advised not to utilise their soaring gear unless they are absolutely convinced that the machine is in perfect tune from A to Z. In the near future low flying will doubtless become the rule, when the results of a slight mechanical derangement will be limited to a gentle return to the adjacent earth. But until all telephone and telegraph wires have been relaid in underground pipes, low flying must be regarded as no less dangerous than moon-brushing, and it will further be necessary to render all barbed wire hedges illegal. The small red boards erected by hunts to signal the presence of wire are scarcely sufficiently obtrusive to safeguard the low skimming motor cycle, and for the present our motto must be "the higher, the better." In conclusion I foresee a great slump in the stock of Burberry and other aquascuta. Instead of donning gaudy and odorous oilskins at the commencement of a heavy shower, we shall simply rise above the clouds, and descend on entering a fresh climatic zone, where the sun is shining brightly.

"Flying over the centre of the town consult the finger-mast"

A NEW 3½ h.p. CYCLECAR.

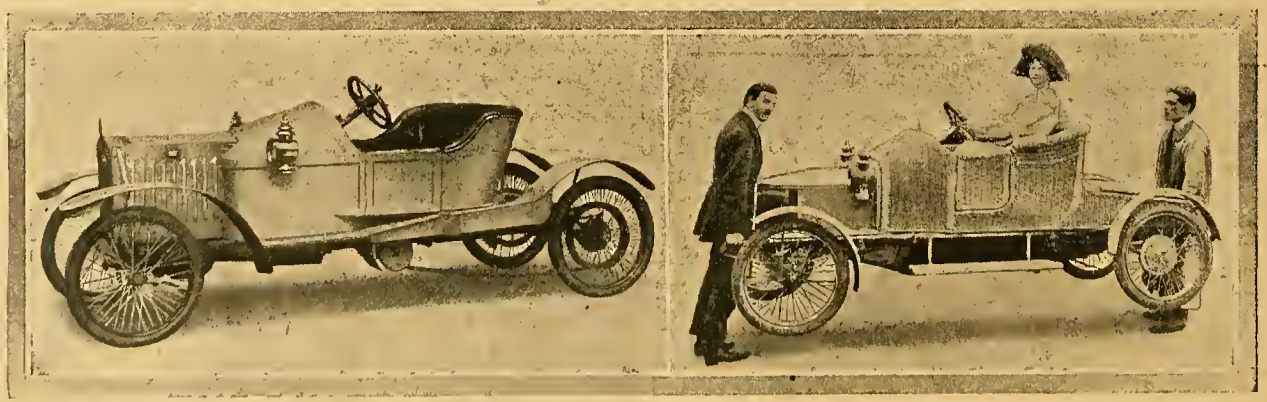
A 3½ h.p. cyclecar of light construction has been built by Mr. V. G. Vitanoff, of Harrogate, whose age is only twenty-one years. The accompanying illustration gives a good idea of the general design of the vehicle, the chief points being a 3½ h.p. Blumfield engine, B. and B. carburetter, C.A.V. magneto, and drip-feed lubricator.

The transmission is as follows: To the engine-shaft is fitted a Chater-Lea leather-to-metal clutch, thence by chain drive to a two-speed gear box, from the gear box by means of another chain to a counter-shaft, and finally to the back wheels by two ⅞in. rubber belts, thereby relying on belt slip to act as a differential. The gears are 5 and 11½ to 1. Ordinary motor cycle wheels, carrying 26in. × 2¼in. tyres, are used, and the steering, by a wheel, is direct.

The machine is capable of a very fair speed, and easily climbs stiff hills, but the springing device, by quarter elliptic springs, seems rather light. The little car is a very commendable effort, and no doubt the next machine turned out by Mr. Vitanoff will incorporate many improvements.

BELTS AND TYRES TO BE TESTED IN THE SIX DAYS' TRIALS.

Mr. T. W. Loughborough speaks most enthusiastically of his reception in the West Country, where everyone received him with the utmost hospitality. Colonel Boles, M.P., M.F.H., will start the first man on the first day of the trial (August 12th), and the Mayor of Taunton will start the first man on the last day.

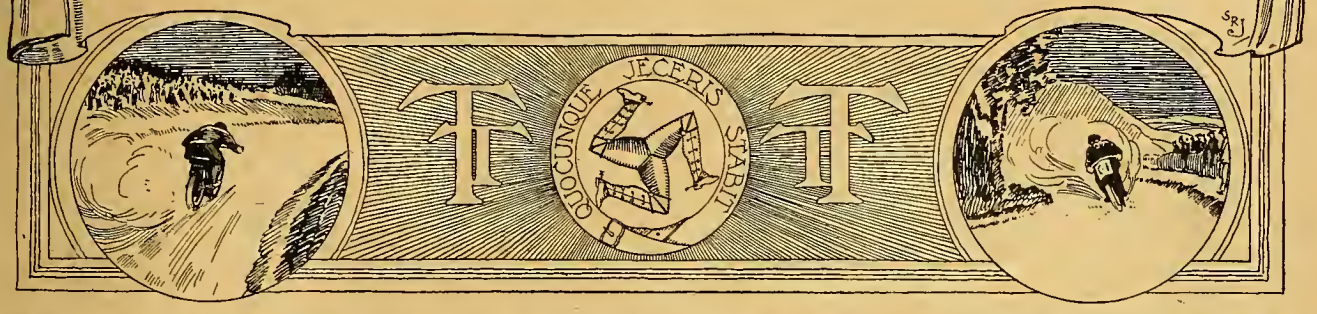


The police, boy scouts, and the press will all combine to render the Six Days' Trial a success.

The slow climb, during which top gear ratios only may be used, will be carried out on Countisbury Hill on the third day.

Sidecar combinations and cyclecars will be started after the motor bicycles at fairly long intervals on each day, so that the two-wheelers may not be impeded on the hills and narrow lanes which abound on the course. Motor bicycles will be started at one minute intervals.

It has now been decided at an A.C.U. Committee meeting that tyres entered for the trial will be purchased over the counter by the A.C.U., the money being refunded later, so as to ensure only stock tyres being used. This idea was suggested in *The Motor Cycle* last week.



It was also decided that belts should be entered under the same conditions as tyres. Belts entered must not be fitted with more than one fastener throughout the trial. Both tyres and belts entered will be branded.

(Left) The new 8 h.p. Beacon cyclecar, which, as will be gathered, is of very light construction. (Right) The 8 h.p. Warne sociable, built by A. T. Warne & Co., of Leytonstone, has an air-cooled J.A.P. engine, chain and belt transmission. The gear ratio is varied by expanding and contracting the countershaft pulleys, the belt tension being adjusted by moving the rear axle. A recent short run in London traffic convinced us of its controllability and smooth running.

The International Tourist Trophy Races.

A BRIEF HISTORY. DETAILS OF COMPETITORS' MACHINES. HOW THE RESULTS WILL BE ANNOUNCED.

THIS year's Tourist Trophy Races will be the sixth meeting of its kind. The first race took place on May 30th, 1907. A race for motor cycles on the lines of the car Tourist Trophy Race had been suggested by Mr. H. W. Staner, the Editor of *The Autocar*, in 1906, but the actual trophy was the outcome of a conversation between Mr. H. Collier, sen., and the Marquis de Mouzilly St. Mars.

In the 1907 race, the petrol consumption was limited to 90 m.p.g. for singles and 75 m.p.g. for twins, and it was won by C. R. Collier on a 3½ Matchless-Jap at a speed of 38.5 m.p.h., his consumption of spirit being at the rate of 94½ m.p.g. H. R. Fowler (5 Norton) won the twin class at a speed of 36.2 m.p.h., and averaged 87 m.p.g.

The fourteen and a half miles triangular course from St. John's to Ballacraine, Kirk Michael, and Peel was used in those days, and was continued in use till last year, when the long course, embracing the Snaefell mountain road, was adopted after much discussion.

In 1908 the petrol consumption was further limited, 100 m.p.g. being stipulated for single and 80 m.p.g. for multi-cylindered machines. The winners were :

SINGLE-CYLINDERS.

J. Marshall (3½ Triumph), at 40.4 m.p.h., and having 38 ozs. of petrol left in his tank.

TWINS.

H. Reed (5 Dot-Peugeot), 38.5 m.p.h., 2 ozs. petrol left.

New Regulations in 1909.

In the following year the consumption limit was abandoned. New regulations were introduced, and singles and twins were run together on the cubic capacity basis, singles 500 c.c. and twins 750 c.c. All machines had to conform to the A.C.U definition of touring machines, but no pedals were allowed. The winner was H. A. Collier (5 twin Matchless) at 49.04 m.p.h. W. F. Newsome (3½ Triumph) being the first rider of a single-cylinder machine to finish, speed 44 02 m.p.h.

In 1910 the capacity of the twins was reduced to 670 c.c., but again the race was won by a twin. Results :

TWIN.

C. R. Collier (5 Matchless) 50.627 m.p.h.

SINGLE.

W. Creyton (3½ Triumph) 47.925 m.p.h.

Last year a much longer course was adopted, and the multi-cylinder capacity reduced to 585 c.c. The distance of the race was 187½ miles, being composed of five laps of 37 miles 4 furlongs. 1911 also marked the institution of a Junior T.T. for lightweights, singles up to 300 c.c., and twins of 340 c.c., over four laps of the same course, and the inclusion of the mountain climb strongly urged by this journal resulted in many new change-speed gears being brought to light. Winners :

SENIOR TWIN.

	h.	m.	s.
O. C. Godfrey (3¾ Indian) ...	3	56	10

SENIOR SINGLE.

J. A. Carvill (3½ Triumph) ...	4	16	49

JUNIOR TWIN.

P. J. Evans (2¾ Humber) ...	3	37	7

JUNIOR SINGLE.

H. A. Collier (2½ Matchless) ...	3	46	20

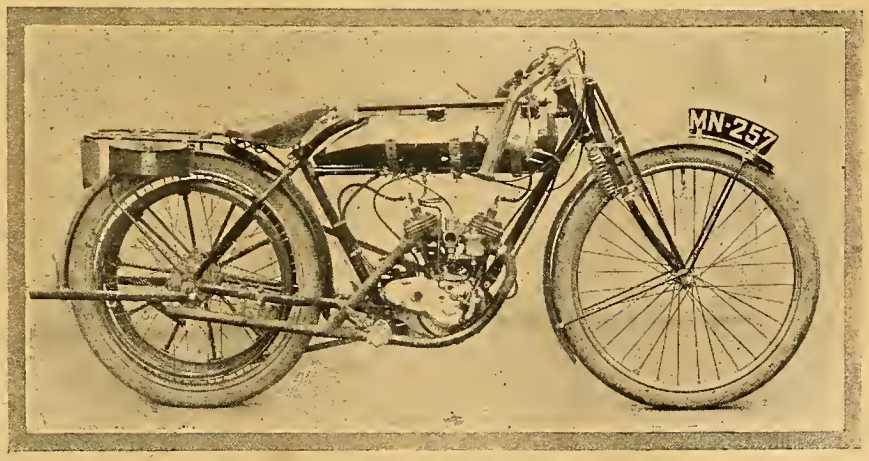
For the sake of comparison, we give also the speed in miles per hour, but it must be remembered that the 1911 course was more difficult than that of 1910, and the twin engines were smaller :

O. C. Godfrey (Indian) ... 47.62 m.p.h.
J. A. Carvill (Triumph) ... 44.89 ,,
P. J. Evans (Humber) ... 41.47 ,,
H. A. Collier (Matchless) ... 39.78 ,,

It will be observed from the gradually reduced cylinder capacities and the increased speed how good an effect the T.T. Races have had upon twin engines.

This Year's Regulations.

This year for the first time twins and singles will compete on an equal basis, 500 c.c. being the limit adopted in the Senior and 350 c.c. in the Junior event.



The following prizes are offered :

First. The Tourist Trophy and £40 cash (Junior, £30).

Second. £20 (Junior, £15).

Third. £10.

Silver cups and £10 and £5 to the first and second private owners, provided they are not in the first three, and that their performances are sufficiently meritorious.

Valve side of the new 2¾ h.p. Junior T.T. twin Humber. Observe the large capacity tank.

COMPLETE LIST OF T.T. ENTRIES.

DETAILS OF COMPETITORS' MACHINES.

BELOW will be found a complete list of entries for the Tourist Trophy Races in the Isle of Man with the numbers of the competitors in the order in which they will start. The total number of entries received for the Senior Race is forty-nine, and for the Junior Race twenty-five. In the Senior Race there are twenty-one private owners, and in the Junior Race eleven private owners.

Senior Race, July 1st.

START, 10 a.m. DISTANCE, 187½ miles (five laps to the course).
DEPOTS: Quarter Bridge and Ramsey.

No.	Rider and Machine.	No. of cyl.	Bore and stroke.	c.c.
*1.	J. R. Haswell (3½ Triumph) ...	1	85 × 88	499
*2.	J. R. Alexander, jun. (3½ Indian)	2	70 × 64.5	497

Announcing the Progress of the T.T. Races.

"THE MOTOR CYCLE" SERIES OF TELEGRAMS.

AS in previous years, *The Motor Cycle* has arranged to telegraph the progress of both the T.T. Races lap by lap, and the final results will be wired to various firms throughout the kingdom. The following firms will exhibit these telegrams as they are handed in:

LONDON.

The Eastern Garage Co., 418, Romford Road, Forest Gate, E.
Alfred Dunhill, Ltd., 359, Euston Road, N.W.
Selfridge and Co., Ltd., Oxford Street, W.
A. W. Gamage, Ltd., Holborn, E.C.
John Piggott, Ltd., 118 Cheapside, E.C.
H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W.C.
The Hutchinson Tyre, 70, Basinghall Street, E.C.
Godfrey and Applebee, Ltd., 208, Great Portland Street, W.
Maude's Motor Mart, 136, Great Portland Street, W.
Robertson Motor Agency, 157, Great Portland Street, W.
Benetfink and Co., Ltd., 107, Cheapside, E.C.
G. N. Higgs, 31, Vauxhall Bridge Road, S.W.
The Service Co., Ltd., 292, High Holborn, W.C.

BIRMINGHAM.—The Premier Motor Co., Ltd., Aston Road; the Para Rubber Co., 93, John Bright Street; Thomas Clayton and Son, Ltd., 125, New Street; P. J. Evans, 358, Stratford Road, Sparkhill; the Colmore Motor Cycle Depot, 31, Colmore Row.
BRADFORD.—Eric Myers, 52, Manningham Lane.
BRISTOL (Montpellier).—The "Leader" Cycle and Motor Depot, Station Road.
COVENTRY.—*Midland Daily Telegraph* Offices.
DUBLIN.—F. A. Wallen and Co., 6 and 7, Nassau Street.
EDINBURGH.—Alexander and Co., 113, Lothian Road.
HULL.—"Embro" Motor Co., 191, Holderness Road.
LEEDS.—A1 Mudscreen Co., 39, Guildford Street.
LEICESTER.—Tom Cann, Ltd., 18, Applegate Street.
LIVERPOOL.—Reliance Engineering Co., Manchester Street: Hitchings Ltd., 74, Bold Street.
LLANDRINDOD WELLS.—Tom Norton, Ltd., the Palace of Sport.
MANCHESTER.—H. Reed and Co., Deansgate.
NEWCASTLE-ON-TYNE.—The Rover Co., Ltd., 86, Northumberland Street; the Percy Motor Co., St. Andrews Place.
NOTTINGHAM.—Bentinck Motor Co., Trent Bridge.
ST. ALBANS.—The New Century Motor Cycle Co.
WOLVERHAMPTON.—Bruce, Ltd., 64, Lichfield Street.

Unalloyed Pleasure—

That is the experience of all who ride the SUPERIOR MACHINE—

. . THE . .

Douglas

VIBRATIONLESS LIGHTWEIGHT

IN order to obtain the maximum of enjoyment from a motor cycle holiday or tour, it is necessary to ride a machine which can be relied upon absolutely to give no trouble. Such a machine is the DOUGLAS VIBRATIONLESS LIGHTWEIGHT. The engine will run for a practically indefinite period without tuning-up. The 1912 models embody numerous improvements. No detail which could be criticised in 1911 has been left untouched. Space prevents these improvements being given here, but they are set out fully in our 1912 Catalogue —a copy of which will be sent on request.

We do not ask you to accept our word alone for the above statements. The proof has been and is being given week by week on road and track. Douglas successes during 1911 occupy five pages of small type in our Catalogue, and the achievements in 1912 to date make another formidable list.

ONE INSTANCE OF DOUGLAS SUPERIORITY.

1912 London-Edinburgh Run.

FIVE DOUGLAS MACHINES completed the DOUBLE journey to Time, and secured FIVE SPECIAL GOLD MEDALS.

¶ Illustrations and full specification of all our models are given in the 1912 Catalogue, together with price list of spare parts and sundries. The catalogue also contains full instructions for the care and management of the machines.

May we send you a copy ?

DOUGLAS BROS., Kingswood, BRISTOL

Telegrams—"Douglas, Kingswood." Telephone—No. 51.

THE B-S-A MOTOR BICYCLES

PROVED THE MOST ECONOMICAL ON PETROL.

The following letter has been received from Invercargill, New Zealand:—

We have been very busy to-day running off the motor cycle test for petrol consumption. The results have proved very satisfactory to us, we having entered three B.S.A. Motor Cycles and scored FIRST, SECOND, and THIRD against all well-known makes competing.

(Signed) P. H. VICKERY.

13, Small Heath, BIRMINGHAM.

A Motor Cyclist's Advice:—"Always use B.S.A. Cylinder Oil for Motor Cycles."

The International T.T. Races.—

T.T. Matchless Machines.

As mentioned in last week's issue, the new T.T. Matchless are fitted with a 3½ h.p. twin Jap engine of 70 mm. bore by 64.5 mm. stroke. The gear

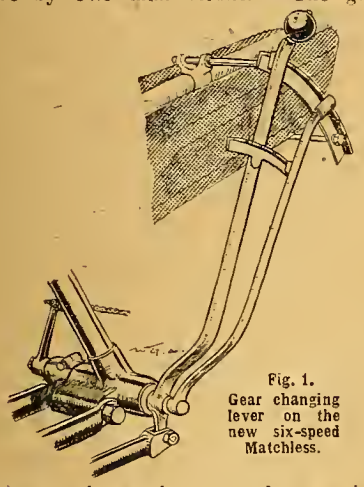

Fig. 1. Gear changing lever on the new six-speed Matchless.

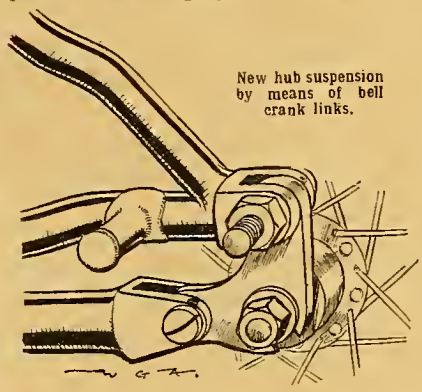
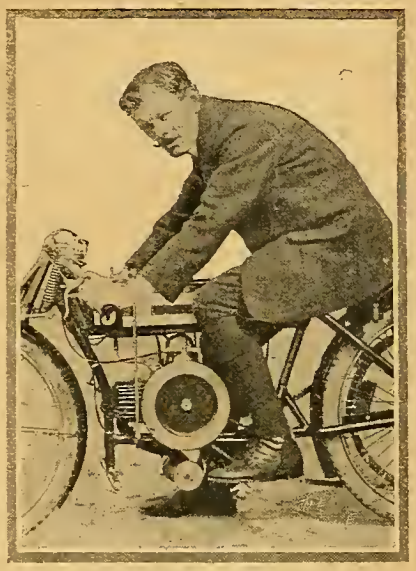


ratios are lower than was the case last year, as it was found impossible to take advantage of the higher gears.

An Amac carburetter and an enclosed Bosch magneto are employed. A Best and Lloyd combined hand pump and drip feed delivers a continual stream of oil to the rear wall of the front cylinder at a point slightly below the bottom edge of the piston wall when the latter is at the top of the stroke. By this means an equal supply of oil is allowed to both cylinders, as centrifugal force causes the rear one to be splashed much more thoroughly than the front.

The petrol tank holds over two gallons and the oil supply is proportionately large; both are fitted with large filler caps. Matchless girder spring forks are employed, and the wheels are shod with Hutchinson 2¼in. rubber-studded "passenger type" tyres.



The principal changes in the design of the variable gear will be best understood by referring to fig. 1, which shows the arrangement of the gear levers. The larger one controls the movement of the rear wheel, whilst the smaller operates the expanding pulley by means of a chain which passes over a sprocket attached to the quick-thread screw mechanism of the outer flange. In last year's model both these levers moved over a notched quadrant attached to the tank, and they were arranged in such a manner that they could both be manipulated together, or separately, when it was required merely to tighten the belt without changing gear. In this year's pattern a much more convenient and handy design has been adopted. As is shown in the drawing, the notched quadrant of the outer lever is attached to the inner lever, and moves with it, so that unless the belt stretches appreciably only one lever has to be handled. The movement of the smaller lever corresponds to taking up two inches of slack in the belt, so that all reasonable emergencies are provided for.

Improvement in design has also taken place in the swinging of the rear hub,

New hub suspension by means of bell crank links.

which rocks on pivot levers with a parallel motion. In previous models the under pair of "chain stays" were taken direct to the axle ends, but, as will be seen in the latest type, a bell-crank link has now been interposed. This is a very considerable improvement, as by means of the slot in which the hub axle is carried the whole back wheel can be slipped out very readily. Hitherto the Colliers have been fortunately fairly free from tyre troubles in the T.T., but the above shows that they are placing no reliance on luck, but are prepared to meet any emergency.

J. Haslam (2¾ h.p. Douglas), Sheffield's representative in the Junior T.T. Race.

As usual, long undershields extending from forward of the crank chamber to a point nearly level with the rear hub will be fitted to all the machines, so as to keep the transmission at all events as nearly as possible free from effects of weather and road conditions.

Another detail worth noting is the provision of a new two-legged stand.

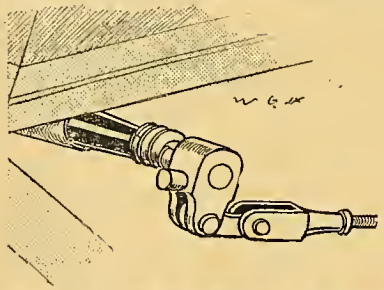
As in previous years, the Matchless machines are enamelled a workmanlike dove-grey, and it is safe to say that no machine in the race will be more complete as regards finish and attention to detail.

O.K.-Precision.

V. Pratt will ride a 2½ h.p. 70 × 90 mm. O.K.-Precision fitted with a Sturmey-Archer three-speed gear, Bosch magneto, Amac carburetter, and 2½in. Hutchison T.T. tyres. All fittings are brazed on where possible, and an auxiliary lubrication pipe fed by a Best and Lloyd semi-automatic lubricator leads to the side of the cylinder. This machine will be conspicuous by reason of its large two-gallon tank painted bright yellow with broad black lining.

Forward.

P. W. Owen and Harold Cox will both ride 2¾ h.p. twin Forwards fitted with Armstrong gears in the Junior race. The design of these machines will closely resemble last year's model. P. W. Owen will also ride a 3½ h.p. 79 × 100 mm. Norton in the Senior race. This machine is fitted with the Armstrong gear and is conspicuous for its comparatively long wheelbase. The tank has a capacity of two gallons of petrol and three quarts of oil. Druid forks and C.A.P. carburetter are used. J. L. E. Emerson will ride a similar machine.



The Regal Precision team—H. C. Mills, J. Woodhouse, and S. F. Garratt—returning from practising, which ceased at 7 a.m. each day.

The International T.T. Races.

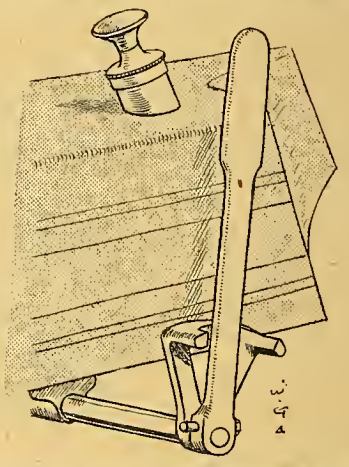
Triumph.

A band of eight stalwarts, J. R. Haswell, I. B. Hart-Davies, J. A. Hoffman, Quentin Smith, C. R. Martin, Alister Kirk, J. W. Adamson, Percy Butler, and W. L. T. Rhys uphold this classic make, and it is not the least suprising to find that one and all will be mounted on standard machines which embody no experimental points whatever. One point, however, is worth attention. In the ordinary course of events, the change-speed lever and quadrant of the Sturmey-Archer three-speed hub is carried on the top tube where a special lug is placed for its reception. In the T.T. Triumph machines a position much more convenient to a racing attitude on the part of the rider has been adopted. This

Triumph gear changing mechanism on left-hand side of tank. The operating lever is on the right.

has necessitated a new design of gear lever and quadrant. The lever is carried on a sleeve clipped to the tube below the tank and is placed well forward. The lever itself is capable of sliding laterally in the sleeve against the action of a spring washer, and as the quadrant is furnished with side slots, or rather grooves, changing gear is performed by a simple push or pull action. J. R. Haswell is particularly delighted with this arrangement, and informs us that he

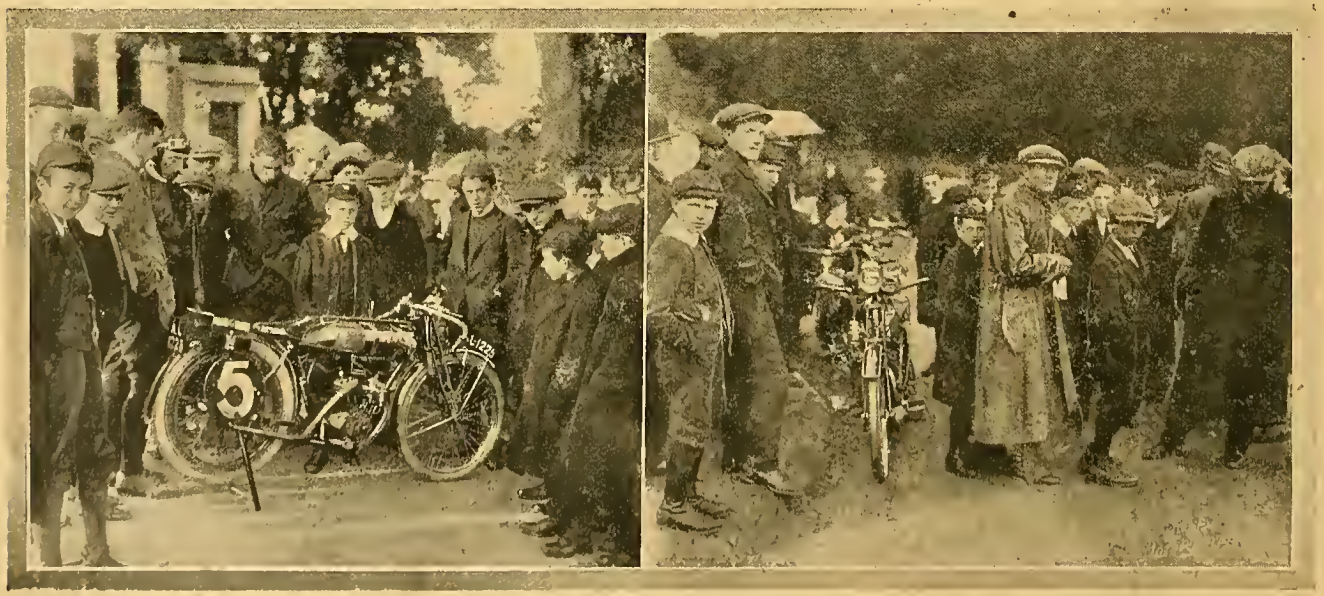
J. R. Haswell (3½ h.p. two-speed Triumph) salutes our photographer. This well-known amateur has been doing exceedingly well in practice.



finds changing a matter of perfect ease in all circumstances. As mentioned last week only two speeds are employed, the bottom gear ratio being suppressed altogether, although the parts still remain in the hub.

On Haswell's Triumph, the position and nature of the brake pedal has also been altered. This is a modification of standard practice, and is solely due to the requirements of the racing position, in which the strength of a heel movement can be taken more advantage of than a toe movement. Except for the pedal, the brake remains exactly the same as on the standard models. It will be noted that the boss of the pedal which is attached to the rocking pivot is formed into a small "ear" which abuts against one of the crank chamber bearer bolt heads in order to provide a stop.

Ivan B. Hart-Davies will ride a T.T. Triumph with a Sturmey-Archer change-speed hub, otherwise the machine will have only slight alterations.

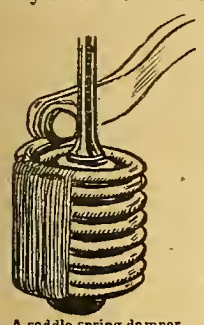


Regal-Precision and Regal-Green.

These two makes, the former of which is in the hands of the redoubtable J. W. Woodhouse, whilst the latter will be ridden by H. C. Mills and S. F. Garrett respectively, are exactly the same except for the engines and gears. Woodhouse's mount, which was described last week, is a very formidable looking air-cooled engine, with enormous radiating surface. Woodhouse finds that even after long pulling

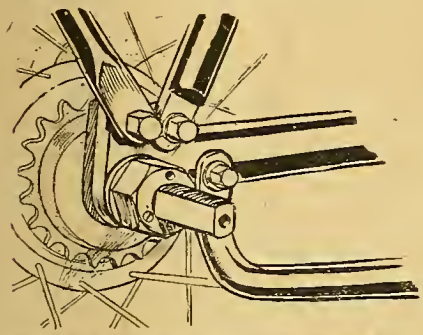
Showing the special gear-changing lever on the Triumph machines, which have a Sturmey-Archer gear adapted for two-speeds only, to enable a quick and sure change.

under heavy load—by way of trying the machine thoroughly it was made to carry a passenger on the carrier from Birmingham to Liverpool—there is not only no sign of overheating, but actually no



PRACTISING FOR THE T.T.

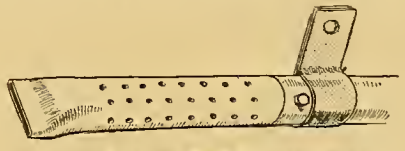
Scenes during the early morning's practising. On the left P. J. Evans, last year's Junior T.T. winner, is seen chatting with the brothers Alexander.



On the right A. J. Sproston and H. P. Bousley keep order at Quarter Bridge, where a crowd assembles each morning.

The International T.T. Races.—

symptom to suggest that the engine was even getting hot at all. At practically any time the hand can be held quite comfortably on the radiating fins. A rather special point of this machine is the care which has been taken to ensure that the three-speed Sturmey-Archer gear does not throw any strain upon the chain stays and other parts of the frame. First of all, a secondary pair of chain stays—which may be described as simple torque tubes — are arranged *à la* Trump-Jap to reinforce the back axle housings, but an even more important detail is the strengthening up of the attachment of the hub spindle itself. It may not be generally known that on the top and intermediate gears a clockwise rotational strain is thrown upon the



A saddle spring damper on J. Woodhouse's machine.

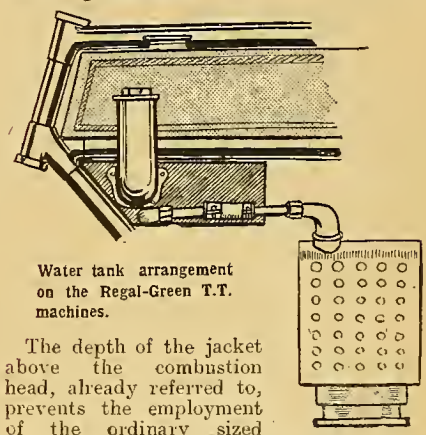
Hub spindle locking device and torque tube on Regal-Precision machines.

hub spindle, whereas when the lowest gear is engaged an anti-clockwise strain is produced. In order to relieve the spindle as far as possible it is provided with a locking piece, which is applied to its flattened threaded ends upon which it is a close driving fit—inside the chain stay ends, and it is here firmly locked in position by the same stud which secures the foot of the carrier tubes. A plate is fixed at each side, that on the pulley side being much stronger than that on the other. For additional security the axle nut is furnished with grub screws.

Both brakes are on one brake rim, and both are controlled by foot. One is above the chain stay, whilst the other is below. Transverse sawcuts are made in the fibre

The Regal-Green and Regal-Precision silencers.

in order to prevent, as far as possible, any liability to glaze, and also to make the engagement more gentle. The tank holds two gallons of petrol and about half a gallon of lubricating oil.



Woodhouse pointed out two other interesting little details, one in connection with the exhaust pipe. The latter is very long, coming to well behind the back hub, and of large diameter, and the end piece is secured in position by a liner and set-screw. Whilst it will be always retained in practice, it will probably be removed on the occasion of the race itself, but not unless this is found to be an advantage.

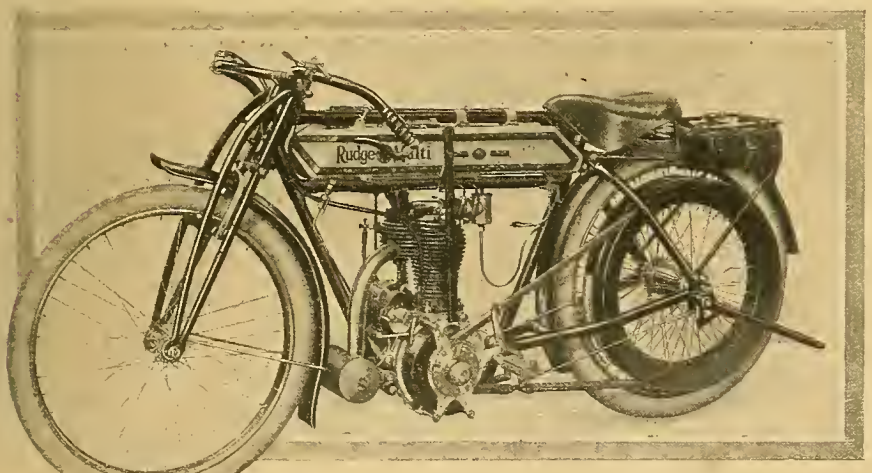
Sphinx sparking plug which is made for use on Green water-cooled engines.

The other point is an ingenious method of imparting extra rigidity to the saddle springs. The coils of these are partially locked together with copper wire, which is claimed to hold them laterally stiff even in the worst circumstances.

As for the Regal-Green it is quite safe to say that no more interesting machine will take part in the race. It is covered with interesting points, all of which show the practical lines upon which the design has been got out. Readers of *The Motor Cycle* are already familiar with the Green system of water-cooling by natural circulation, in which the radiators are applied to the actual water-jacket of the cylinder. An additional water tank is carried, which is punt-shaped, and placed immediately under and behind the steering head; it is filled through a large L-shaped tube provided with a stopper. On each side are outlet pipes, which proceed to the top of each of the honeycomb radiators. Cursory examination of the valve system might lead to the impression that the spring is quite short; it is, however, of quite usual length, but, owing to the depth of the water-jacket which surrounds the valve chest, only a small part protrudes above the cylinder head. The carburetter is carried behind the cylinder, while the exhaust pipe occupies a similar position in front.

Water tank arrangement on the Regal-Green T.T. machines.

The depth of the jacket above the combustion head, already referred to, prevents the employment of the ordinary sized plug, and accordingly special ones with enormously long bodies have been made by the Sphinx Manufacturing Co. These are of the single point variety, and possess by reason of their very design a notable advantage over the ordinary pattern. This is that the mica insulating pillar does not get nearly so hot as usual, and is therefore a much more perfect non-conductor. This point is so apparent that Woodhouse is using the same plug on his air-cooled engine, although in this case, of course, an ordinary short-bodied plug could be used.



The Regal-Green machines are both fitted with the Brampton gear, a description and illustrations of which appeared in *The Motor Cycle* of June 6th.

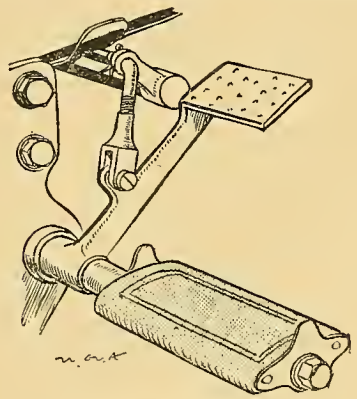
The gear change lever and quadrant, working the pulley through a twin-link chain, is situated in a very convenient position on the top tube, to which it is clipped by a special attachment. Means are provided for adjusting the lever segment as to chain tension, and also as to its position relative to the inclined planes of the pulley.

The general tendency in the Island is to look upon these water-cooled mounts as providing a very probable winner.

Trump-Jap.

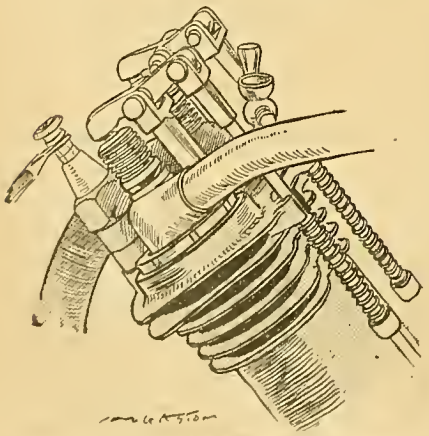
The Trump-Jap, ridden by J. Gibson, is a decidedly smart machine, standard in every respect with the exception of dropped handle-bar, large filler caps, etc. It is fitted with an Armstrong three-speed hub, Amac carburetter, Druid forks, and is, generally speaking, amongst the least noisy of the T.T. machines. Gibson has competed in previous races, so may be expected to do well.

The Multi Rudge Tourist Trophy machines, which have twenty speeds. The forks are the standard spring forks fitted backwards.



The International T.T. Races.—

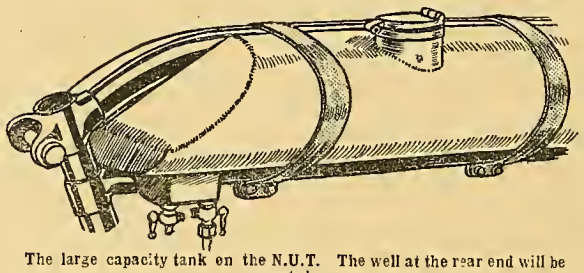
Indian.



The 3½ h.p. twin Indians are exactly the same, in fact identical with the machines which swept the board last year, except that the stroke has been shortened to 64.5 mm. to get the capacity within the limit. They have the new type of roller bearing back hub with enclosed brake, which made its first appearance at last year's race, and also large auxiliary oil tanks.

N.U.T.

Amongst the neatest constructed machines entered for the Junior T.T. are the N.U.T.'s (short for Newcastle-upon-Tyne), which will be ridden by Hugh Mason and Robert Ellis. The former is also riding a Matchless in the Senior. This last machine has already been described in these columns, and it therefore suffices to mention only a small fitting which Hugh Mason has introduced on his own account. This is a double brake arrangement which appears to work very well. There are two pedals both mounted on the same spindle, one being operated by the toe and the other by the heel. Each actuates a separate shoe on the belt rim, and, whilst one of these shoes is placed above the chain stay—so providing a fierce brake—the other is below it, and is more gentle in action. The two brakes can each be applied separately or both can be put on together.

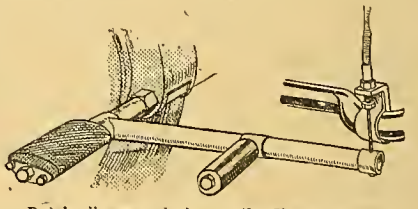


Heel brake on the N.U.T.

Cylinder of new overhead Moto-Reve engine fitted to the N.U.T. machine.

The two N.U.T. machines are identical except for their engines, one of which (Mason's) is a specially-designed twin J.A.P. of 60 mm. × 61 mm. (345 c.c.), while the other is a Moto-Rêve twin, 53 × 78 mm., also specially designed. It is rather interesting to note that the former motor unit is nearly twice as heavy as the latter, although their c.c. are almost the same, but, on the other hand, the J.A.P. is certainly slightly the more powerful of the two. The Moto-Rêve unit weighs as a matter of fact just on 30 lbs. complete with magneto, carburetter, etc. It has been specially constructed—the work only occupying some three weeks—and is practically a reduced facsimile of the bigger twin which the intrepid Berlie rode in the Senior race last year. A small feature which is worth attention, though it may easily escape it, is the provision of insulating washers for the purpose of preserving the temper of the valve springs. The latter rest upon what are practically little metal footstools with four legs arranged to allow the air a free passage round and through them.

The large capacity tank on the N.U.T. The well at the rear end will be noted.



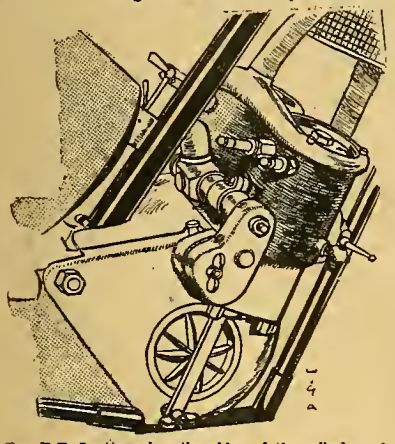
The cylinders are set at an angle of 45°, and the valve tappets face one another across the top of the crank chamber. The valves are of large diameter, but exceedingly light, and necessitate a very wide combustion chamber. Nothing could be more striking than the difference in design between this engine and the equivalent J.A.P. In the latter, for instance, the valve springs are at least six times as strong as in the other. The M.-R. engined N.U.T. is credited unofficially as having covered a measured distance at 60 m.p.h.—a marvellous performance for so tiny an engine.

Mason informed us that he has improved his own engine, the J.A.P., considerably by installing a heavyweight size of magneto which does not, at high speeds, seem to take as much from the engine as it gives back, whilst the pulling power at low revolutions is very marked. Both engines have Amac carburetters. The transmission is by belt, and Armstrong Triplex hub gears are fitted. The change-speed quadrant of the latter has on one of the machines been fitted with an additional securing device to guard, as far as possible, against the possibility of unintentional gear changes. A split pin tied to a piece of string and a hole in the quadrant plate are all the working parts of the device. Lubrication is by Best and Lloyd forced drip feed. The brakework on these lightweights is carried out in a way that conclusively proves Mason to be a designer of sound sense. Each machine has a couple of foot brakes as well as the usual hand brakes. On the J.A.P. engined machine, the hub pedal is arranged somewhat differently from that on the Moto-Rêve.

A very notable feature of the N.U.T.'s is the large capacity of the oil and petrol tanks. The former has a volume of 2¼ gallons, and it is expected that it will be able to run right through the 150 miles without filling up; although large it does not appear clumsy. The deep well at the rear end of the tank is not only useful in allowing the last spot of petrol to be used, but it is especially valuable when water gets into the petrol; turning on the drain tap for a moment practically ensures its liberation with very little loss of spirit.

Singer.

In common with so many other machines the Singer lightweights which are being ridden in the Junior race by Harold Petty, R. G. Mundy, and D. R. O'Donovan, are the ordinary standard 2½ h.p. model, similar to that which G. E. Stanley has been riding so victoriously at Brooklands. The only novel detail about them is the foot operated lubricating device. A long crank is pivoted on the footrest bar, and is fitted with a roller-pedal, which gives a multiplying lever effect to the end piece, to which is attached a Bowden wire, the casing of which is anchored to the chain stay. The wire passes up the saddle tube and along the tank to the hand pump, which it operates in opposition to a very strong internal spring. The whole arrangement is very nicely carried out, and is not in the least unsightly. Petty states that he finds it a very great convenience indeed, as it can be worked without affecting one's knee grip.



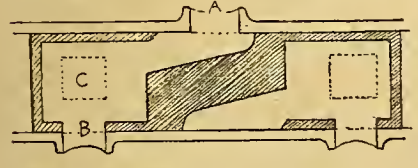
Pedal oil pump device on the Singer Junior machines.

Scott.

Many interesting features are to be found in the two Scott machines, which will be ridden by Frank Philipp and F. A. Applebee respectively. In general the design is the same as last year, but there is a number of detail differences. In the first place the engine is smaller, having a bore of 69.8 mm. and a stroke of 63.5 = 486.6 cubic capacity. The most noticeable change in the engine is, however, the arrangement of the water jacket; formerly this extended right over the cylinder head, but in the T.T. machines the head is left plain and air-cooled—the exact reverse of the 1910 Scotts, which had water-cooled heads and air-cooled cylinders.

Several advantages are claimed for the alteration. Firstly it allows a higher compression to be used without danger

The International T.T. Races.—
of pre-ignition—this is owing, however, principally to the fact that the plug points are more adequately cooled. Next it reduces the quantity of water carried and so reduces the weight and size of the radiator. Around the cylinder the water jacket is set eccentrically, giving the larger space on the upper side of the engine. The plugs are screwed into quite thin steel sleeves, which are in turn screwed through the water jacket into



New T.T. Scott engine, the sides of the cylinders of which only are water-cooled.

the cylinder. There is thus no excess of cast iron round the plug, and the thinness of the adapter renders its cooling very efficient. As a stand-by in case of need a second plug is inserted in each cylinder, but on a distance of 1,200 miles it has not been found necessary to use the second set.

It may thus be concluded that all possibility of plug trouble has now been successfully obviated. A point that is worth noting is that the plugs which are not used show no tendency to soot up.

The patent distributer valve, which was used for the first time in last year's race, has been retained, but instead of being, as previously, driven by chain, it now employs a train of pinions which are contained in a neat stamped aluminium casing attached to the side of the crank chamber. The main drive is taken from a toothed ring on the lay-shaft to a second pinion on the end of a short shaft which passes right through the right hand crank chamber. The

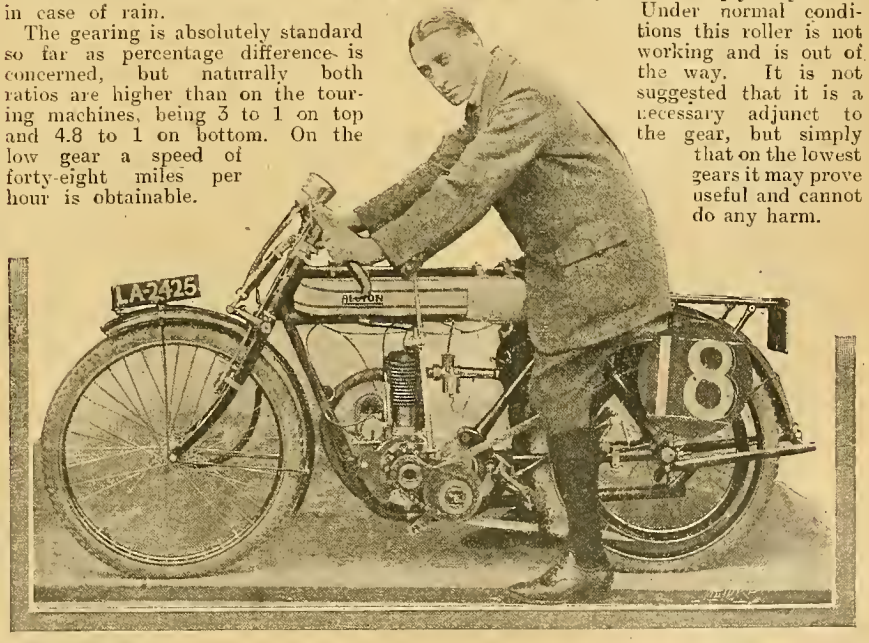
Section of Scott valve. The letters are referred to in our description.

valve itself is of ingenious design and forms a distributer controlling the admission of gas to the crank chamber, where it is compressed, and thence to the cylinder proper.

The action of the valve will be perhaps better understood by reference to the sectional sketch. When the port A is at the top it places the crank chamber in direct communication with the carburetter, the port B for this purpose being registered with a port of the crank chamber and the body of the valve having a deep channel cut in it.

Later in the stroke the port A disappears behind the containing sleeve, and a third port C is brought opposite the crank chamber port at the same time as the port B is opposite the cylinder port. The compressed gases thus pass from the crank chamber to the combustion head.

Whilst this is taking place the ports of the other end of the valve are opening communication between the carburetter and the other crank chamber, and so the cycle of operations proceeds in due course.

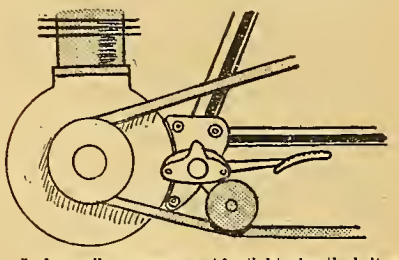


The valve, which is specially lubricated and takes a quite inappreciable amount of power to drive, rotates at the same speed as the crankshaft, and is employed to give a very rapid cut-off, large port area, and to prevent wear on the pistons affecting the volumetric efficiency of the engine.

Last year the engine control was effected by advancing or retarding the rotary valve by means of a quick thread screw device. This has been discarded in favour of an ordinary throttle to the carburetter. The carburetter is fixed on the side of the crank chamber instead of in its usual position, where it forms the lid of the crank chamber itself; it is thus readily accessible. This is an important point.

The inlet pipe, which is quickly detachable without the use of tools by means of special spring clip devices, is covered with indiarubber in order, as far as possible, to retain the heat and so enhance the mixing effect of the petrol and air.

Other interesting points of the Scott machine are the new silencer with double exhaust pipe and the foot brake operating on the tyre rim. The tank is very large and is fitted with a filler cap of record dimensions, viz., 3½in. in diameter. The wits have it that the idea is for the rider to sit in the tank in case of rain.



The gearing is absolutely standard so far as percentage difference is concerned, but naturally both ratios are higher than on the touring machines, being 3 to 1 on top and 4.8 to 1 on bottom. On the low gear a speed of forty-eight miles per hour is obtainable.

N. D. Slatter and the combined chain and belt-driven two-speed Alcyon he will ride in to-morrow's Junior T.T. This machine has behaved extremely well in practice.

Ivy-Precision.

H. C. Newman's 2½ h.p. Ivy-Precision is a stoutly built little machine which looks as though it could stand a deal of knocking about. For all that it is a marvellously speedy little mount. The engine is the standard lightweight model, 70 mm. bore × 90 mm. stroke, and is principally notable for the patent force feed device which Newman has fitted to the carburetter—an Amac. From the timing gear case a pipe, with a bulb valve at its foot, is led to the air inlet underneath the jet. The effect of this is that on the down stroke of the piston the

Jockey pulley arrangement for tightening the belt on H. C. Newman's Ivy-Precision.

compression in the crank chamber forces a stream of air past the jet at high velocity and so materially helps to atomise the petrol. According to report this simple little contrivance has a remarkable effect on petrol consumption, whilst it is also claimed to keep the engine much cooler than would ordinarily be the case. This is another machine on which the brakes have received adequate attention, there being two separate foot brakes on the belt rim as well as the front rim type.

Newman is using the Brampton gear, but employs a foot-controlled belt tensioner in connection with the variable pulley. It consists simply of a grooved roller mounted on a roller-bearing spindle and carried by a crank pivoting on the footrest bar. To tension the belt the pedal is simply depressed. Under normal conditions this roller is not working and is out of the way. It is not suggested that it is a necessary adjunct to the gear, but simply that on the lowest gears it may prove useful and cannot do any harm.

PRACTISING ON THE COURSE.

J. Gibson (Trump-Jap) bringing in J. Harrison Watson, who suffered a spill on the mountain road and bent his forks.

Wednesday, June 19th.

Very few of the riders and machines have arrived yet, and in consequence the official opening morning of practice was rather tame. Douglas M. Brown (2¾ Humber), P. W. Owen (2¾ Forward), J. R. Haswell (3½ Triumph), and Quentin Smith (3½ Triumph), were the only riders out, and all were content with a single circuit at a very moderate speed. Rain poured down through the whole of Tuesday night, and this fact no doubt deterred the others from practising. As a matter of fact the general opinion was that the roads had stood their sousing very well indeed, but that part of the course that lies between Kirk Michael and Ramsey is treacherously greasy under the trees, and rather rough going at that.

The improvements to the course, which have been made by the Highway Board, and which were illustrated last week, are much appreciated. The road over Quarter Bridge is now nearly twice as wide as it previously used to be. Surveyed from the hill down which one descends to it, the bridge still looks formidable, but its safety has been enhanced out of all knowledge, and provided reasonable care be used it can be negotiated at a fairly good speed. The work has cost the Highway Board a matter of £1,200, and the competitors can congratulate themselves upon reaping the immediate benefit, since, as it has only just been completed, the surface is smooth hard Tarmac, which will be moderately skid proof in any weather.

The other improvement, also illustrated last week, viz., the widening of the road opposite Mr. Hall Caine's residence, Greeba Castle, was most desirable. The bend here was very deceptive, especially as it was partially obscured by trees. As a danger spot it has now ceased to exist, and thus one of the nastiest sections of the course has been removed.

The marking of the course is now finished, and it has been done in a very thorough manner. Three hundred yards before each danger zone, such as Braddon Bridge, Sulby Bridge, etc., a large blue banner is slung across the road at a suitable height bearing the following inscription in monstrous white letters, "Such and such a place 300 yards." Last year wind, weather, and hay carts played havoc with the banners, and in order to prevent a repetition of this arrangements have now been made whereby the banners are erected every morning and taken down immediately after the conclusion of practice. There are altogether twenty-two marked places.

The Second Day's Practice.

Thursday, June 20th.

A much better morning's practice was got in to-day, thanks to a decided improvement in the weather. It poured with rain yesterday afternoon, but during the night a brisk wind dried up the roads wonderfully. A number of competitors and machines arrived yesterday,

J. A. Hoffmann (Triumph) passing Woodlands. This point is near the start.

and most of the new comers were out betimes this morning. With the roads as they are, and at the beginning of things, nothing in the way of fast circuit times has been attempted, the best so far being about an hour.

The annual trouble with spectators on motor cycles has cropped up again. For some unexplainable reason some motor cyclists are riding round the course in the reverse direction. During this morning's practice a number of riders made complaint about meeting non-competitors coming in the opposite direction. A firm stand on the part of the officials must be made another year to remove this difficulty. This morning there was little or no mist on the mountain, but the sheep on the roads were troublesome.

Amongst the earliest out at Quarter Bridge were the Regal-Green and Regal-Precision riders, S. F. Garrett, H. C.

P. J. Evans and W. Creyton in full flight. Evans, it may be observed, has been using a speedometer during practice. The Quarter Bridge is seen in the background.

Practising on the Course.—

Mills, and J. W. Woodhouse. Harrison Watson and D. M. Brown (2¾ Humbers) soon after came along, and both showed excellent acceleration from the Bridge. The road to Braddon is in excellent condition, and offers one of the few opportunities at present for travelling all out. W. Jones and A. S. Jones were the next to appear on Rudge-Multis, which appear to be ordinary standard machines. Quentin Smith and J. R. Haswell (Triumphs) were also early out and found the going better than yesterday. P. W. Owen (Norton) was in slight trouble with his gear adjustment, but from the sound of the engine exhaust he can have little to complain of in the way of power. The Norton has a characteristic long-stroke exhaust, very reminiscent of a ported cylinder, and shows excellent powers of acceleration.

The brothers Alexander were out on two-speed 7 h.p. Indians. Evidently the policy of practising on a hack to save the hunter which worked so well with the Indian team last year is being judiciously followed by these riders. P. J. Evans (2¾ Humber), the Junior T.T. Cup holder, was also out. S. F. Garrett (Regal-Green) picked up the first puncture on the course near Quarter Bridge. J. W. Woodhouse found himself going too fast at Sulby Bridge, and wisely turned into the side road. H. Petty (2½ Singer) jumped the kerb at Ramsey, and rode on the footpath to avoid the watersplash.

The greasy parts of the road were so bad that great care was exercised by all.

Friday, June 21st.

A beautiful evening on Thursday, warm and fine, with a valuable drying wind, gave promise of better road conditions this morning, but, unfortunately, a heavy shower fell during the night, and the course has therefore had no chance to recover. From appearances at the time of writing, more rain to-day seems imminent. What is wanted is, of course, a spell of fine weather, winding up with a light shower the day before the race, sufficient to lay the dust. As it is, the greasy parts of the course are getting worse and worse, and in view of this fact it is really surprising that such good times have been made.

This morning the police turned up at Quarter Bridge, and caused the crowd to leave the fairway clear. Exactly why it should be so is not obvious, but for some reason or other there are always at Quarter Bridge youths who persist in doing figures of eight on push-bicycles in the middle of the road just as a competitor is coming down the hill.

Another unexplainable mystery is this—that several motor cyclists, both competitors and non-competitors, lose all sense of responsibility the moment they set foot on Manx soil, or, indeed, on Manx steamer deck. Yesterday quite an amount of trouble was caused by competitors who refused to show their licences to the police officer who meets every boat, on the ground that at the time of asking they were not riding their machines. Of course, the police stopped these men immediately they mounted their machines.

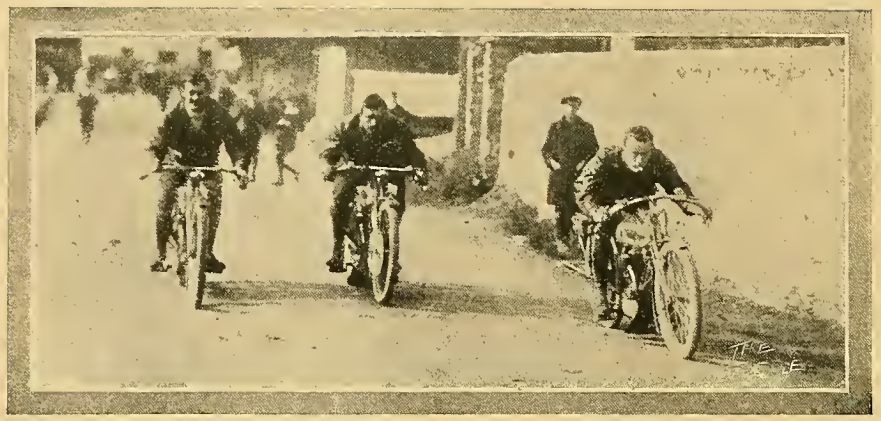
On the whole, however, the tolerant inhabitants of a thoroughly sporting little island will not have so much to grumble at this year, as stringent regulations have put a stop to most of the futile "blinding" which used to take place. Mr. H. P. Beasley, the A.C.U. assistant secretary, has maintained authority very well indeed under rather difficult circumstances.

Why competitors cannot take the trouble to read the regulations of a race which must cost them from first to last a very considerable sum of money is one of those things which will only be understood in the millennium. The regulations say that ear-rolls must be worn at practice (a very wise provision indeed), official number plates must be carried, and competitors must not be on the course except between 5 and 7 a.m., yet only constant watchfulness prevents a breach of such simple rules by quite a number of riders.

The Silencer Question.

It is rather unfortunate that the "silencer" farce is still being played this year. According to the regulations issued by the A.C.U., "efficient silencers *must* be fitted during practice." Now the quietest of all the machines can be heard literally for miles when its throttle is opened, and it is really very difficult to see how some of the engines could be made much noisier for the actual race (wherein silencers are not required). On the basis of cubic capacity, this year's machines seem slightly noisier than they were last year, and therefore the paragraph which states that "any competitor . . . whose machine makes any noise likely to inconvenience other users of the highway will render himself liable to disqualification" might just as well have been left out.

This morning the following riders were out, some of them doing two circuits, but most of them only one: P. W. Owen (Norton), J. L. E. Emerson (Norton), Harrison-Watson (Humber), P. J. Evans (Humber), A. H. Alexander and J. R. Alexander (Indians), J. A. Hoffmann (Triumph), John Gibson (Trump-Jap), J. Haslam (2¾ Douglas), S. F. Garrett (Regal-Green), H. C. Mills (Regal-Green), N. D. Slatter (Alcyon), I. B. Hart-Davies (Triumph), Hugh Mason (N.U.T.), R. Ellis (N.U.T.), H. Petty (Singer), A. S. Jones and W. Jones (Rudges), J. Stewart (Douglas), H. C. Newman (Ivy-Precision), S. L. Bailey (Douglas), and E. V. Pratt (O.K.-Precision).



Several competitors got round in just about one hour, by far the best time being the unofficial one of 49m. credited to P. W. Owen. If this is correct, it simply shows the value of knowing the course, as Owen has done two laps each morning so far—more than anyone else.

S. F. Garrett created a mild sensation by taking Quarter Bridge at a good speed, and swinging down the Castletown Road instead of remaining on the course. This would have been all right except for the obvious fact that the Castletown Road

T.T. RIDERS PRACTISING ON THE COURSE.

1.—Percy Butler (Triumph). 2.—F. Philipp (Scott). 3.—J. R. Alexander (Indian). 4.—H. Reed (Dot-Jap). 5.—H. A. Collier (Matchless). 6.—W. Heaton (Dot).

Quentin Smith, J. W. Adamson, and C. R. Martin practising on the T.T. course on Monday morning last
All are riding Triumphs in the senior event.

was almost blocked with competitors' machines, cars, and spectators. Garrett kept straight on at the latter, who, fortunately, jumped aside in time. As luck would have it, there was nothing else in the way. As he seemed particularly pleased with his exploit we will not spoil his triumph by reproducing the remarks made at the time by competitors and spectators alike.

Beyond the facts that Harrison-Watson ran into the bank somewhere near Hillberry and crumpled up his forks, and that Garrett's engine smashed something in its "innards," nothing of note happened.

Slatter was mounted on a standard single-cylinder Alcyon—not the machine on which he will race.

Saturday, June 22nd.

On Friday night it poured with rain again, and the roads were very little improved by practising time this morning. The number of competitors who turned up was small. Amongst others, the following, however, braved the elements: S. F. Garrett (Regal-Green), A. H. and J. R. Alexander and J. F. Sirett (Indians), P. W. Owen (Norton), J. Woodhouse (Regal-Precision), A. Hall (Rudge), J. W. Adamson (Triumph), Hart-Davies (Triumph), J. R. Haswell (Triumph), H. C. Mills (Regal-Green), D. C. Bolton (Rudge), Quentin Smith (Triumph), F. Philipp (Scott), A. S. Jones and W. Jones (Rudges), J. L. E. Emerson (Norton), H. C. Newman (Ivy-Precision), and N. D. Slatter (Alcyon).

Unquestionably the most admired man of any was Frank Philipp, who arrived yesterday. The way his machine flies away from the mark with a perfectly startling acceleration compels everybody's attention and admiration. Philipp has done the very wise thing of giving his machine a thorough bucketing before bringing it over. It has already run over 1,200 miles, mostly over Welsh hills, and is consequently perfectly run in.

Unfortunately, F. A. Applebee had the very bad luck to smash the front forks of his Scott in taking it to Ramsey. The accident occurred at a turning, and might easily have been worse. The front wheel was buckled out of all shape, but the frame stood the strain all right. Happily, Applebee escaped with a few bruises.

Little of note occurred this morning, nearly everybody contenting himself with one steady lap. Newman broke a valve on the mountain, whilst Slatter took a toss at Windy Corner.

Monday's Practising.

Monday, June 24th.

Practising continued this morning in fine weather and on good roads. The brothers Collier, Percy Butler, and the brothers Bashall made their first appearance on the course. Alan Woodman, who has been debarred from racing by the A.C.U. on account of his infirmity being likely to cause danger to other competitors, also rode round.

The following lap times were made: H. A. Collier (Matchless) 49m., A. H. Alexander (Indian) 50m., J. R. Haswell (Triumph) 52m., D. M. Brown (Humber) 55m. Unfortunately, a rather nasty accident occurred at Kirk Michael corner. H. H. Huckle (Zenith) struck the bank and was reported to have suffered slight concussion of the brain. He was taken to his apartments in Douglas by the doctor. S. F. Garrett (Regal-Green) fell at Sulby Bridge, but, fortunately, was not injured. A. H. Alexander (Indian) also hit the bridge. On the mountain road H. C. Mills (Regal-Precision) fell and broke the frame of his machine and buckled a wheel. C. R. Collier (Matchless) made one circuit, but stopped to help Huckle.

W. H. Bashall (Douglas) informed us that it is possible a four-speed gear box may be fitted to the Douglas machines.

C. R. Franklin (Indian) arrived fresh from his last week's Brooklands performance, and at once commenced practising in earnest.

Police Regulations.

Competitors, as they arrived on the boats at Douglas, were met by a police representative and asked for their driving licences, particulars of their machines, and where they intended to stay. This did not do away with the necessity of registering with the Isle of Man Highway Board and also the Auto Cycle Union. Arrangements were made whereby it was possible to get petrol on the pier so that a long push to the nearest garage was obviated. Motor cyclists who cross this week will welcome this convenience, and we understand that their thanks are due to the Auto Cycle Union, whose assistant secretary, Mr. H. P. Beasley, was on the island all last week making this and similar arrangements.

A private road through Ramsey is giving competitors a shaking during their practice spins, but the surface may be remedied before the races are run.

Tourist Trophy Race Awards.—Gold medals will be awarded to all competitors who complete the course within half an hour of the first man home.

N.S.U.

None of the N.S.U. machines entered for the races had been seen on the Island by mid-day on Tuesday. From what we can learn, it is extremely improbable that N.S.U. riders will take part, which is to be regretted.

S. L. Bailey, the Australian, and E. Kickham, of Bristol, who are much fancied riders of Douglas machines in the Junior T.T. Both have also entered for the Senior Race on Monday

The Next Mobilisation Test.

The result of the second mobilisation carried out at Maidenhead on the 9th inst. was so satisfactory in the valuable statistics it afforded that most of the criticisms hitherto levelled at motor cyclists from the military point of view have been withdrawn.

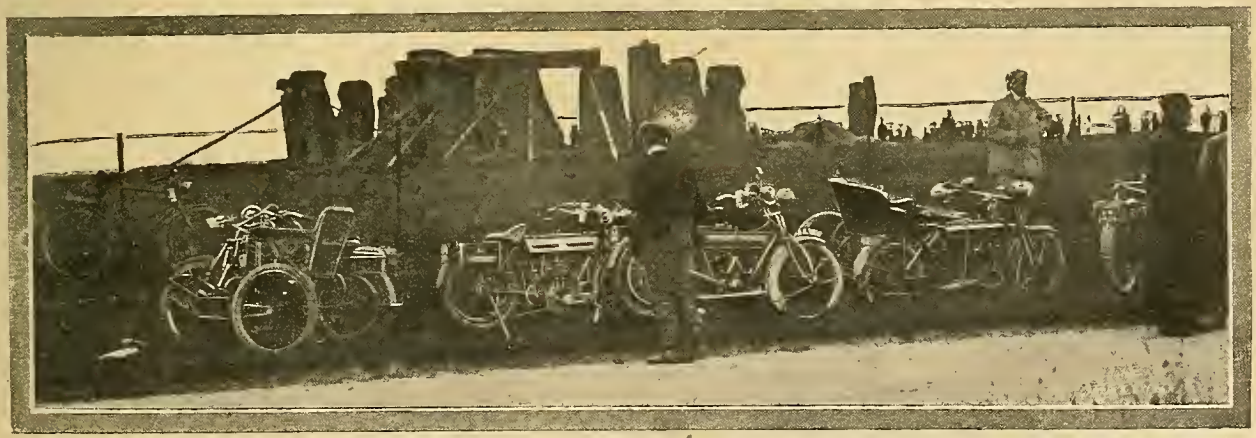
It should be remembered that these tests are carried out with a very definite object, viz., that of establishing the value of the motor cycle as an instrument of war—incidentally they provide a considerable amount of sport and pleasure for those who participate.

The next test will be held in the vicinity of Nottingham on Sunday, July 7th, the hour of concentration being fixed for 1 p.m. A novel feature will be introduced on this occasion, for participants will have to ride in teams to the place of rendezvous. Each team will travel in whatever formation the senior organising officer present deems most suitable. There will be seven teams in all made up as under, each having its own rendezvous and allotted hour of starting.

Team.	Rendezvous.
1. London and S.E. England	Tottenham Cross.
2. S.W. England ...	Newbury G.W.R. Station.
3. West	G.W.R. Station, Cheltenham.
4. East Anglia ...	Market Place, Royston.
5. S. Midlands ...	*The Motor Cycle* Offices, Coventry.
6. N. West	L. and N.W.R. Station, Crewe.
7. N. East	N.E.R. Station, York.

All those who wish to participate in this test should send three penny stamps, together with a stamped postcard, addressed to themselves made out as follows:

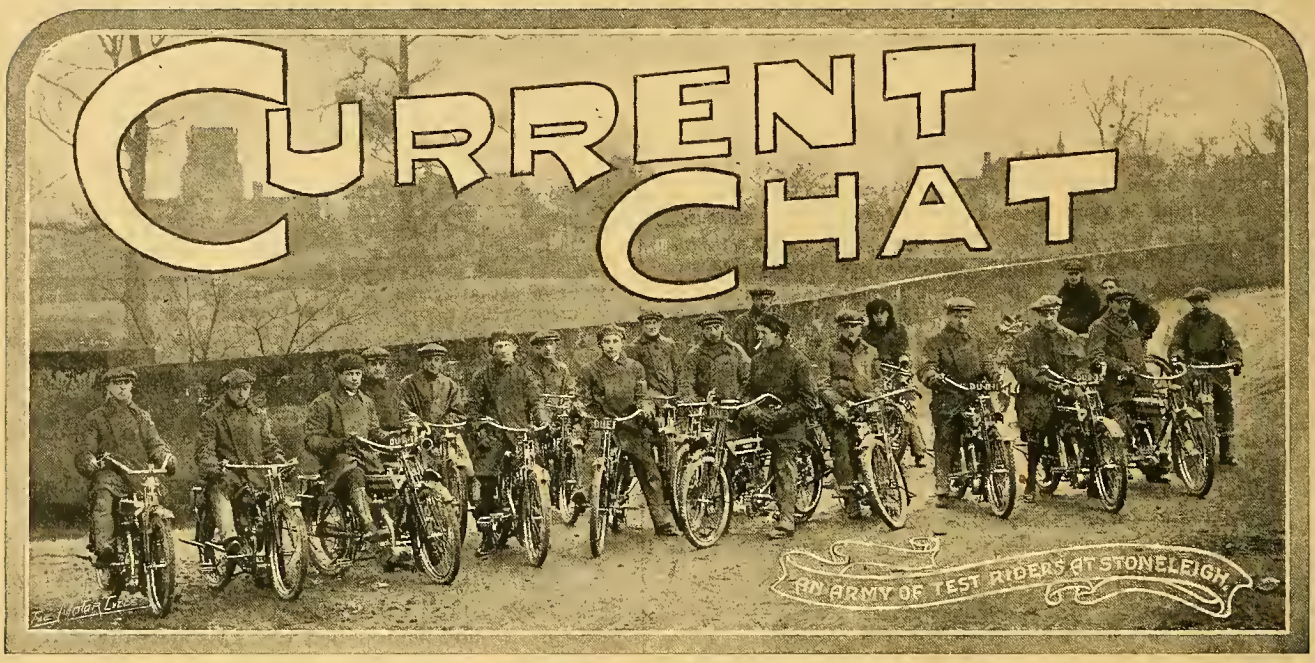
I propose to join team No.....
at .....
at (Time to be filled in by hon. sec.).....
to arrive there at 1. p.m.
Make of machine and h.p.....
Hour of actual arrival at team rendezvous.....
Hour of actual arrival at general rendezvous.....
Name .....



Entry postcards should be sent to the hon. secretary, the Legion of Cyclists, 128, Jermyn Street, W.

TYRE MAKERS AND THE A.C.U. SIX DAYS' TRIAL.

At the time of going to press, we understand that at a meeting of the Tyre Section of the Manufacturers' Union, the tyre makers present, after some discussion, unanimously decided not to enter any of their tyres for the test which is to be run in conjunction with the Six Days' Trial, the reason given being that the expense would be too heavy. This decision is very much to be regretted. However, we understand that the A.C.U. will, if it cannot be dealt with direct from the trade, obtain tyres elsewhere and make awards in connection with their performances.



Round the Coast of Devon and Cornwall.

THIS strenuous trial was run off by the Exeter and District M.C.C. on the 14th and 15th inst. The following riders started from Exeter at 10 p.m.: T. H. Birdshall (3¾ h.p. Premier), B. Rae (B.S.A.), P. Pike (3½ h.p. Humber), S. Saunders (Rudge multi), E. Chesnutt (2¾ h.p. Douglas), W. Abbot (Bradbury two-speed), E. Babington (5 h.p. Bat), J. Milner (Rudge multi), E. Wood (3½ h.p. Humber), F. Broadbear (Premier), H. Maurice (Premier), E. T. Arden (Premier), A. Arden (Premier), W. E. Roots (3½ h.p. Singer three-speed), L. Martin (Singer), H. Tremlet (Rudge), and L. Long (Zenith), and fifteen arrived to time at Plymouth where a stop of fifteen minutes was allowed. The next stop was Truro, where Woods retired with engine trouble. The fourteen survivors having breakfasted at Penzance, followed the North coast as far as Bideford without incident. Here Long retired through valve trouble. Now came the severest part of the course, but the riders were equal to the occasion, though Lynton Hill was in a shocking condition. After tea at Lynmouth, Countisbury Hill and the descent of Porlock were safely accomplished by the thirteen survivors. Roots retired at Minehead owing to gear trouble, which was unlucky, as this rider had come from Coventry to compete and had finished the hardest part of the course. Twelve riders passed through Tiverton and Sidmouth, most of them making a clean ascent of Peak Hill. Arden was, unfortunately, stopped by a seized engine near the finish. Pike was the first to arrive at Exeter, quickly followed by Saunders, Babington, Broadbear, Arden, Abbot, and Maurice, who all arrived within schedule time. Chesnutt, who rode the only lightweight to complete the course, was a few minutes late. Birdshall came in with a flat tyre, as he had punctured four miles from home. Saunders, Maurice, and Babington claim non-stop runs. Considering the weather—it rained for twelve hours—the results were excellent, and the riders are to be heartily congratulated on their performance on this stiff coast ride.

LONGEST DAY PILGRIMS AT STONEHENGE. June 21st being the only day in the whole year that at sunrise a shadow is cast by the Heel Stone across the Altar Stone at Stonehenge, it was made the occasion of a pilgrimage at daybreak by members of the Universal Bond of the Sons of Men and many Americans. Our picture shows a number of motor cycles whose owners rode in before sunrise to be present.

CURRENT CHAT

A T.T. Race in the Wet.

Up to the present, a wet day for the T.T. Race is unknown, but it seems highly probable, in view of the fact that it has rained every day this month, that this chain of luck will be broken.

Hill-climbing.

F. C. North writes to inform us that his 3½ h.p. Ariel and sidecar recently took four passengers up Rose Hill from a standing start. The performance was witnessed by numerous cyclists and motor cyclists.

M.C.C. Fourth Race Meeting.

The fourth private race meeting of the Motor Cycling Club will be held at Brooklands on Saturday, July 6th, and promises to be as successful as its predecessors. There will be twelve events, including one for cyclecars. Racing will commence at 2 p.m.

Bwlch-y-Groes and Sidecars.

Since writing the notes on page 724, we have heard that J. Mills, of Rhyl, with George Yarnold as passenger, climbed the pass on his 6 h.p. Enfield sidecar on the 21st—the same day as R. Lord. The ascent was witnessed by two others. We are now exercised in our minds as to who was really the first to reach the summit of the pass on a sidecar, Lord or Mills.

The Liverpool A.C.C. at Bwlch-y-Groes.

Fired by the reports of successful ascents of Bwlch-y-Groes, the Liverpool A.C.C. arranged a trip to the hill on the 23rd inst., as mentioned elsewhere in this issue. Of a good number who took part, six riders made clean ascents. The star performances were certainly those of L. Mogridge, who made a clean ascent on his 3½ single-geared Mead-Precision; N. Brown, who took up a passenger on his 7 h.p. two-speed Indian; and S. W. Philpott, who made a fine ascent on a 2¾ two-speed Humber—the first successful lightweight.

Birmingham Reliability Trial.

Dr. B. Fawssett (8 h.p. Chater-Lea and Lowen sidecar) won the South Birmingham M.C.C. reliability trial last Saturday, gaining the gold watch, S. K. Jones (3½ L.M.C.) being second, silver watch winner, and E. Roberts (3½ Triumph) third, bronze medal. 85% of the competitors climbed Sunrising, and 90% got up Edge Hill.

Arthur Moorhouse Memorial Fund.

The following are among the more recent donations to the above fund: Per S. F. Garrett (card 316), £2 6s.; Stockport and District M.C.C., £2 2s.; some of his friends at Waygood's, £15; Zenith Motors, Ltd., £5 5s.; Bristol M.C.C., £2 2s.; Bosch Magneto Co., £5 5s.; J. W. G. Brooker, £1 1s.; and E. Gwynne, £2 2s. The fund now totals over £300.

NEAR THE TOP OF BWLCH-Y-GROES, FROM THE DINAS MAWDDWY SIDE.
This severe mountain climb, which has been much talked of since the Coventry and Warwickshire Club went there at the beginning of the month, was visited by the Liverpool A.C.C. this week.
L. Mogridge (3½ Mead-Precision) is seen going well near the top

HUTCH TY

"DISTINCT FROM ALL OTHERS."

THE SEVEREST AND FINEST TEST HAS BEEN

IMPORTANT NOTICE.

The Tyres used in the above event, and in every Competition or Trial are identical in every respect to those obtainable from any bona-fide Agent. : :

THE HUTCHINSON TYRE CO.,

In answering this advertisement it is desirable to mention "The Motor Cycle."

A New Name.

The Leeds is the title by which the 3½ h.p. machine made by Messrs. Job, Day and Sons will in future be known.

Good News.

Belts as well as tyres are to be officially tested in the A.C.U. Six Days' Reliability Trials, to take place in August on Devon and Somersetshire roads.

T.T. Rules Explained.

A meeting of T.T. competitors and officials will be held at the Setton Hotel, Douglas (A.C.U. headquarters) this evening (Thursday) at six o'clock. The meeting will give an opportunity of clearing up any doubts regarding the interpretation of the regulations. Armlets and instructions will also be issued to officials and members and to the competitors.

Road Race in South Africa.

There was some good riding in the Orange Grove to Pretoria and back road race on the 12th ult. G. T. Taylor (T.T. twin Bat) was expected to win, but he was put out of the running by belt trouble. The winner rode very well. Results: 1, A. Howie (T.T. Rudge), 1h. 8m. 37⅗s.; 2, R. Cotter (T.T. Triumph), 1h. 12m. 27s.; 3, A. Siems (B.S.A.), 1h. 17m. 16⅗s.

How the Railways treat Motor Bicycles.

The Great Northern Railway Company lately issued a counterfoil of consignment note and waybill for live stock by passenger train No. 370 to a member of our staff and described the live stock as *one motor bicycle*.

Was the author of this interesting document the immortal porter of a country station, who, on looking up the rates for a live tortoise, ejaculated: "Rabbits is dorgs, and cats is dorgs, but this 'ere seems to me ter be a bloomin' insect."

The New Sunbeam.

Like most other large firms who have entered the motor cycle industry at a late stage, John Marston, Ltd., of Wolverhampton, are carrying out their tests with motor cycles most carefully. For months motor cycles bearing the Sunbeam transfer have been seen undergoing tests on the roads in the neighbourhood of the works, and we are given to understand that a 2¾ h.p. single-cylinder mount, with two-speed countershaft gear and chain transmission enclosed in oil bath cases, will be the model finally adopted. The specification is certainly a tempting one for all-weather solo work.

Machines in the T.T.

It is interesting to compare the numbers of the different makes of mounts entered for the T.T. The Triumph has been chosen by nine riders in the Senior race, Indian by five, Rudge, Matchless, and N.S.U. four, Singer and Blumfield three, Dot, Scott, Regal-Green, Norton, Zenith, and Douglas two, and Trump-Jap, Regal-Precision, Cayenne, Cleveland, and Rex one each.

In the Junior race Humber and Douglas head the list with five each, then come N.S.U. four, Singer three, Alcyon, Newcastle-upon-Tyne, and Forward two, Ivy-Precision, and O.K.-Precision one each.

FUTURE EVENTS

June 28.—JUNIOR TOURIST TROPHY RACE.
July 1.—SENIOR TOURIST TROPHY RACE.
„ 6.—Dublin M.C.C. Open Hill-climb.
„ 15.—Irish Open End-to-end Reliability Trial.
„ 20.—B.M.C.R.C. Race Meeting.
„ 20.—Liverpool A.C.C. Open Speed Trials.
„ 20.—South Wales A.C., and Cardiff M.C.C. Open Speed Trials at Porthcawl.

Jake de Rosier Fund.

The above fund, started by *Motor Cycling*, of Chicago, U.S.A., has now reached £50. It will be remembered that some months ago Jake de Rosier in a match at one of the saucer tracks in America sustained serious injuries, and is still in hospital.

Stolen Machines.

On the evening of Sunday, the 16th inst., two 3½ h.p. Rudges, one a 1912 multi, registration AM384, machine No. 641370, engine No. 2748, were stolen from Stamford Hill. The other is a six speed 1911 model. Information should be given to the Liverpool and Victoria Insurance Corporation, 45, Holborn Viaduct, E.C.

Experimental Cyclecars with Double Engines.

There are a couple of experimental cyclecars running about the Coventry district fitted with two 3½ h.p. standard single-cylinder motor cycle engines *à la* the Quadrant carette of 1905. These machines are the product of large local firms, but there is no intention of adopting them as a marketable article—at any rate until they have undergone exhaustive tests on the road.

A Detailed Report Next Thursday.

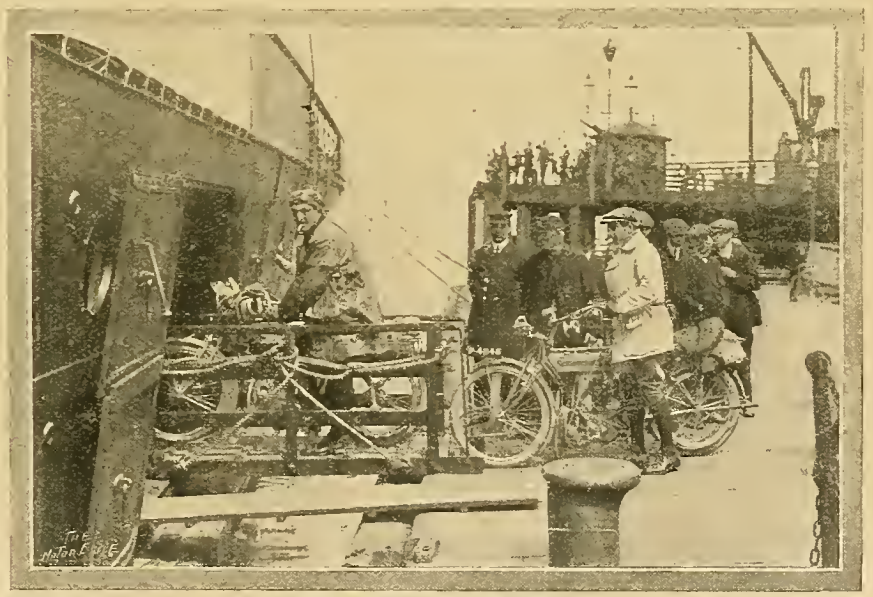
Next Thursday's issue of this journal will contain a detailed description of the Tourist Trophy Races written and illustrated by our own staff.

Reckless Driving—A Warning.

We understand that the Birmingham police are about to take active measures against motor cyclists for driving recklessly.

A.A. and M.U. General Meeting.

The annual general meeting of the Automobile Association and Motor Union will take place at the Hotel Cecil (Richelieu Room), London, on July 1st at 12.30 p.m.



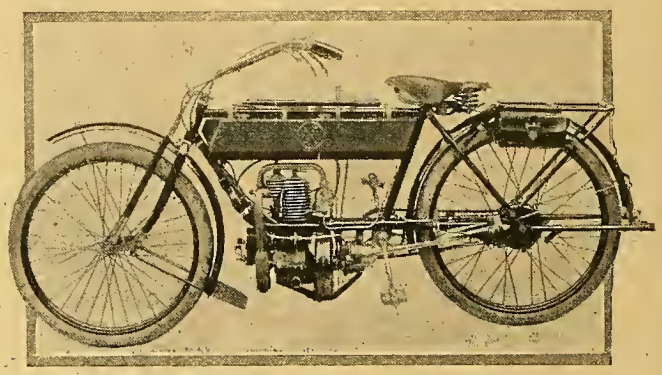
B.A.R.C. Meeting.

The tenth short motor cycle handicap will be run at the B.A.R.C. meeting at Brooklands on Saturday, July 13th. This is a race for all classes of motor bicycles, distance five and three-quarter miles; the entrant of the winner to receive ten sovereigns or cup at option, the second five sovereigns, and the third three sovereigns. Entries close July 2nd and should be addressed to the secretary Carlton House, Regent Street, S.W

Scottish Six Days' Trials.

The entries for the Scottish trials to date are as follow: B. Allan Hill (7 Indian), Hugh Gibson (3½ Bradbury sc.), W. D. South (3½ Rudge), C. W. Meredith (3½ Bradbury), Vernon Taylor (3½ Rudge), S. J. K. Thomson (8 Bat sc.), Miss Muriel Hind (6 Rex), T. Silver (3½ Quadrant), L. E. Cass (4½ Quadrant), J. Henderson Begg (3½ Rudge), J. S. Holroyd (2½ Motosacoche), and H. Le Vack (2½ Motosacoche).

The hon. secretary of the Edinburgh and District M.C., 32, Alva Street, Edinburgh, will be glad to hear from any motor cyclists who might be willing to assist the club in checking.



THE MECCA OF MOTOR CYCLISTS.

Hardly a day has passed this month without motor cyclists crossing to the Isle of Man. Above may be seen a Rudge and Triumph rider wheeling their machines aboard the "Viking" at Liverpool. They had ridden from the Midlands.

A NEW F.N. MODEL.

The engine of the new model 2½-3 h.p. F.N. has a bore and stroke of 65 × 86 mm. = 285 c.c. The tank is now much wider and fitted with large glass top filler caps. The telescopic sliding joints of the spring forks have been made grease and dust proof, and grease caps are provided to the spindle both on the fixed and movable portions of the forks. The crank case is provided with two windows, opposite each other, so that it is possible now to see right through and thus to gauge the level of the oil with greater certainty. The new oil pump is larger than the old one. When the plunger is pulled up a powerful spring returns it slowly to its original position and forces the oil through a sight feed below the tank. The frequency of the drips can be regulated by turning the pump handle to the left. The frame of the machine is 2in. lower than previously, and is now only 17in. in height. The whole machine is beautifully made, and is a splendid example of the excellent work of the F N. Company.

The New 2½-3 h.p. single-cylinder two-speed F.N.

RECORD BREAKING AT BROOKLANDS.

310 MILES IN 300 MINUTES.

On Thursday last, at Brooklands, C. B. Franklin, on a 7 h.p. Indian, No. 28, 998 c.c., succeeded in making a handsome addition to the list of records already held by the Hendee Co. He started at 11 a.m., in very windy weather, and during the ride there were two heavy showers. The machine was equipped with Hutchinson tyres, while Pratt's spirit and Wakefield Castrol oil were used. The records beaten were the following:

	mls.	yds.	m.p.h.
Two hours	131	1,735	65.99
Four hours	254	1,638	63.73
Five hours	310		62.00
Six hours	373	1,725	62.33

	h.	m.	s.	m.p.h.
250 miles	3	51	3	64.92
300 miles	4	42	31⅖	63.72
350 miles	5	36	2⅗	62.50

During the whole of this magnificent ride Franklin never failed to maintain an average of over 60 m.p.h., while several laps were covered at the enormous speed of 71 m.p.h. No mechanical troubles were experienced, the only stop being for refreshment and twice to change the tyres as a precaution.

AN IRISH RECORD BREAKER.

C. B. Franklin (7 h.p. Indian), who is the first motor cyclist to cover 310 miles within 300 mins.

BWLCH-Y-GROES (DINAS MAWDDWY) CLIMBED ON A SIDECAR.

EVER since the query we asked at the conclusion of our description of the last hill-climbing exploit at Bwlch-y-Groes (more commonly called Dinas Mawddwy), who would be the first to take a sidecar and passenger up this mountain pass, rumours of projected attempts have reached us, and we ourselves have been invited to observe no less than four attempts. The feat has now been accomplished, R. Lord twice successfully driving a 6 h.p. Rex Sidette to the summit of the pass on Friday last. To avoid confusion, we should explain that the real Dinas Mawddwy, climbed (?) by the competitors in the A.C.U. six days' trials of 1909, lies between the village of that name and Dolgelly. But this ascent, though severe, does not compare with Bwlch-y-Groes — the Pass of the Cross — which is nearly two miles long and is 1,790ft. above sea level. Approaching the hill with his standard gears of 4¼ and 8½ to 1, Lord tried his luck to gain an idea of the ratio required for success. Fortunately for him the gate was open, and he just managed to get to the 1 in 4 section before coming to a standstill. Descending again, he lowered the gear to 5 to 1, giving a 10 to 1 low gear, and this time was successful. The passenger's name was A. Clayton. He continued his way to Bala, and at the White Lion Hotel told the proprietor, Mr. William Owen, of his achievement. Mr. Owen, who weighs nearly 14 stones, at once accepted an invitation to occupy the sidecar seat in a further attempt, so Lord took all three up the Bala side of the pass on the Rex, and later climbed the noted Bwlch-y-Groes again with Mr. Owen.

How to get to Bwlch-y-Groes.

At the beginning of this week the Liverpool M.C.C. arranged a run to the hill, and though several motor bicyclists were successful, including E. F. Baxter (6 Rex), S. W. Philpott (2¾ Humber), and a rider of a 7 two-speed Indian; no member's sidecar was successful.

CLUB NEWS.

Wath and District M.C.

The above club held a successful hill-climb at Bromborough on the 15th inst. There were sixteen entrants. The fast and slow event was won by W. Kelly (P. and M.), second prize by W. Nicholson (3½ Campion).

Taunton and District M.C.C.

The 100 mile reliability trial, held on the 13th inst., was run in three sections, each starting and finishing in Taunton. Result :

1. T. Drayton (3½ Triumph), non-stop, error 85s.
2. G. F. Arnold (2¾ Motosacoche), error 116s.
3. A. H. Knight (2¾ Humber), one stop, error 22s.

Harrogate and District M.C.C.

The novel competition, which included, amongst other items, reliability, fast and slow hill-climbs, and brake tests, resulted as follows :

Solo Class.—1, W. Fawcett (2½ A.J.S.); 2, R. E. Davies (6 Matchless); 3, G. Hill (3¾ Scott).

Passenger Class.—1, W. Hill (3¾ Scott sc.); 2, C. A. Nettleton (3½ New Hudson sc.); 3, M. Kitchin (3½ New Hudson sc.)

Cumberland County M.C.C.

A very successful non-stop run, for which there were a dozen entrants, took place on the 15th inst., starting from Keswick at minute intervals. The competitors rode three circuits of Bassenthwaite Lake, and on each round were timed at the Pheasant Inn, Peel Wyke. Some heavy showers made riding to schedule time most difficult. Shaw (N.U.T.) and H. Robinson (B.S.A. T.T. model) tied by riding dead on time. These riders were again sent to do another circuit, and a secret check was taken where Robinson was 50s. ahead of time. At the finishing check Robinson was 5s. out and Shaw 10s. On the total count the latter proved to be the winner. J. W. Whitelock (N.S.U.) was third.

Ilkley and District M.C.C.

The reliability trial for the President's Trophy took place on the 15th and 16th inst. The course was *via* York and Pickering to Whitby, where the night was spent. On the next day the homeward journey was by the coast road to Saltburn, then to Guisborough and Thirsk (where there was a two hours' lunch stop), then over Sutton Bank and Riveaux Bank to Helmsley, Boroughbridge, Harrogate, and Ilkley. The hills on the route proved too much for some of the men. The result is as follows :

1 (winner of President's Cup), Morris Wood (6 h.p. Matchless), gross error 2¾ marks, handicap 3, nett error —¼.

2, J. Norman Longfield (3¾ h.p. Scott), gross error ½ mark, scratch, nett error ½.

3, Chas. Thackray (3½ Contrast-Jap), gross error 52¾ marks, scratch, nett error 52¾.

Middlesorough M.C. 200 miles Reliability Trial to Harrogate and back. A group of members at the start from Marton Bungalow.

Herts A. and Ae.C. (Motor Cycle Section).

A speed-judging competition will take place on the 6th prox. The competition will be held at the cross roads on No-Man's-Land, about three miles north of St. Albans.

Grosvenor M.C.C. (Manchester).

The result of the 100 miles reliability trial, held on the 16th inst. from the Swan Hotel, Bucklow Hill, Cheshire, is as follows: 1, J. Anderson (3½ T.T. Rudge); 2, J. Dawson (3½ T.T. Rudge); 3, A. Hopkinson (3½ Triumph).

Sheffield and Hallamshire M.C.C.

A novel competition was held on the 22nd inst., a race down Baslow Hill on the knock-out principle with the high-tension wires removed. Maximum gears and weights were fixed. Results: 1, Dan Bradbury (3½ Norton); 2, S. Sawer (3½ Premier); 3, F. H. Ronksley (3½ Rudge).

Newport (Mon.) M.C.

The results of the last competitions are as follows:

Flexibility Hill-climb.—1, W. C. Venn (Triumph); 2, W. Jones (James).

Petrol Consumption Trial.—1, O. Harris (T.T. Rudge), 160 m.p.g.; 2, W. F. Turner (T.T. Rudge).

Speed-judging Trial.—1, W. Watchell; 2, J. Foreman

Merionethshire M.C.C.

A petrol consumption test over a circular route of about forty-nine miles was held on the 19th inst., starting from Dolgelly. Results: 1, O. Hughes (3½ Arno); 2, Enion Pierce (3½ Rudge); 3, E. W. Hughes (3½ Triumph); 4, Arthur Williams (3½ Triumph).

Streatham and District M.C.C.

The official results of the reliability competition for the Julian Orde Cup, held on the 8th inst., are as follows: 1, W. L. Barratt (8 Bat sc.), 487 marks, wins the cup; 2, W. Pratt (P. and M.), 486, gold medal; 3, R. G. Mundy (Singer), 476, silver medal. Bronze medals: H. B. Willoughby 475, C. J. Feeney 468, A. G. Daw 466.

Carlyle (Chelsea) C. and M.C.C.

The club's first reliability trial was held on the 16th inst. Three prizes were offered for running nearest to the schedule time (watches and speedometers barred). The winners were: 1, G. T. Hopkins (6 Zenith), lost 4½ marks; 2, A. J. Brookes (3½ Premier), lost 5 marks; 3, F. Priston (3½ Humber), lost 11 marks.

Westmorland M.C.C.

The President's hill-climb took place at Orton Scar on the 15th inst. The knock-out competition was won by A. Moffat (6 Zenith), fastest time of the day. G. W. Braithwaite (3½ Zenith), fastest time on a single-cylinder. S. Pearse (2¾ N.S.U.) won Lord Lonsdale's Challenge Cup.

Western District M.C. (London).

The results, subject to confirmation of the annual hill-climb, worked out on the formula $\frac{W}{C \times t^2}$ as recommended by *The Motor Cycle*, are as follow: 1, W. F. Ritchie (3½ h.p. Bradbury), 340; 2, F. W. Ritchie (8 h.p. Matchless), 290; 3, G. D. Green (2¾ h.p. Douglas), 286.

Flexibility Hill-climb.—Result: Class I.—1, A. C. Robbins (2 h.p. Humber); 2, W. F. Ritchie (3½ Bradbury). Class II.—1, E. S. Ritter (2¾ h.p. Douglas); 2, G. D. Green (2¾ h.p. Douglas). Class III.—1, H. Butler (9 h.p. Chater Lea-Jap and sc.); 2, F. Eagle (6 h.p. N.S.U. and sc.).

Dublin and District M.C.C.

The novices' reliability trial on the 22nd inst. from Dublin to Maryborough and back brought out a field of fifteen riders. Rain fell throughout.

The following finished the course: J. Livens (3½ h.p. Rudge), P. Beattie (3½ h.p. Rudge), J. Bradley (2¾ h.p. Douglas), B. J. Gogarty (3½ h.p. Triumph), W. J. Towell (3½ h.p. Rudge), B. Hartmann (3½ h.p. Rudge), V. J. Farrell (3½ h.p. Triumph), H. T. Carroll (3½ h.p. Singer), W. G. Greene (2½ h.p. A.J.S.), H. A. Conneff (3½ h.p. Triumph), and J. S. Mathews (3½ h.p. Triumph).

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Road Conditions between Kew and Richmond.

Sir,—The bad condition of this road has been caused by motor traffic. In the old days of the horse trams it was all that could be desired, but since the motor 'buses invaded Richmond regularly the road has got into a scandalous condition, and I think it is high time the authorities were asked by the R.A.C. or A.C.U. to make it fit for modern traffic. Knowing the above and also Honister Pass, which "Injured Ancient" referred to, I can state that the surface is "not yet" quite so bad as Honister, but if nothing is done it may be ere long.

I would recommend motorists going from Kew Bridge to Richmond to turn into Mortlake Road after passing Kew Green. Then take the first turn to the right, which leads on to Sandycombe Road, and thence straight into Richmond. It is very little farther than by the main road, and is certainly much more comfortable for travelling over.

W. B. LITTLE, Captain Cumberland C.M.C.C.

Cyclecar Design.

Sir,—I have pleasure in enclosing a photograph of a registered design of the H.S.M. two-seated cyclecar which I have recently designed and built.

This machine is mounted on three wheels, with spring forks to the front wheel and semi-elliptic springs to the rear axle, absorbing all road shocks.

It is fitted with 7-9 h.p. J.A.P. engine, 9in. leather to metal clutch, Chater Lea three-speed gear box, wheel steering, coach-built metal panelled body, and adjustable windscreen.

I have given it a severe testing on the road, and the results have been very satisfactory. The vibration is very slight, and, although I have driven it over every condition of road, both wet and dry, I have never had the slightest skid or side-slip.

With my wife as passenger, our total weight being just over 24 stones, the vehicle has never yet refused a hill.

The machine can be turned in its own length.

F. HELLENS.

The H.S.M. double seated sidecar.

The Danger of Uncontrolled Dogs.

Sir,—I am glad Mr. Wilks (N.C.U.) is taking up the question of dogs, but would it be any good to report the matter to a policeman I was cycling through Ll—— the other day and a policeman's dog chased me for some distance and the owner did not seem to try to get him back until I shouted to him, and he was a sergeant too. Dogs are the greatest danger to motor cyclists and something should be done.

D.M.D.

Sir,—I think the suggestion of having a "black list" for dogs a very good one, and I am sure if motor cyclists will take the matter up, as suggested by Mr. Wilks, that we shall very soon see a great reduction in the number of uncontrolled dogs on the road. You were good enough, about a year ago, to insert a letter of mine, in which I suggested the same remedy, but, unfortunately, it was not taken up. But I think now that Mr. Wilks has kindly offered to do the greater part of the work, we as motor cyclists have an opportunity that ought not to be missed. I am sure the result will be well worth the small amount of trouble. I, personally, shall be pleased to take it up, and I should like to know the address to which particulars may be sent.

S. H. MERRICK.

Should Ladies Race?

Sir,—The several letters *re* ladies riding in speed competitions appear to have been prompted by the regrettable accident to Miss Hough at Harley Bank, and the writers imply, or seem to take it for granted, that the accident occurred *because* the rider was a lady, and for that reason did not possess the necessary nerve or ability a present day hill-climb demands. I am in no wise in favour of ladies racing, preferring to see them engaged in less dangerous pursuits; neither do I imagine the average lady is so mentally and physically fit for the sport as the average man; nevertheless, I think it is due to those courageous fair ones, particularly Miss Hough and Miss Muriel Hind, to say that many male riders would need considerably to improve to equal some of their performances. With no desire to flatter, I maintain that a comparison of Miss Hough's cornering with that of the *majority* of the men riders in the first two classes of the Sutton Club event at Harley Bank put the men to shame.

A clean sweeping curve with the machine at the limit of angle, it appeared on the verge of a skid the whole way round, and yet no trace of nerves or hesitation—not a wobble—and the same in the second heat until she struck that slight dip in the road centre, which at that speed meant a certain skid or a wider curve. She took the latter, and the spectators, who had been warned, proved her undoing.

Here I would like emphatically to contradict a report that has gained currency to the effect that Mr. Frank S. Whitworth, the agent for the machine she was riding, was responsible for the accident, owing to his expressing dissatisfaction, and asking her to do better on her next ascent. This is a gross injustice. He asked her to be careful, and to cut out if she found she could not keep on the inside of the crown of the road. Will irresponsible gossippers and others please note this?

Motor cycling for ladies generally, touring or competing in reliability trials, seems in no way to detract from the womanliness of the participant; but hurtling at dangerous speeds with bent back and tense muscles in a hill-climb does not impress me with the sense of gentleness one likes to associate with the sex, although not implying that such denotes an absence of these attributes.

JAMES L. NORTON.

Should Ladies Race?

Sir,—With your permission I would again encroach on your valuable space to convey to Mr. Acton Hill my thanks for the information he so kindly imparts in your last issue, especially for informing me of woman's mission. Now I shall know. The suffragette shot is an unfortunate one, as at present I am one of the anti's and would much prefer a Kempshall cover to a vote. Where the coal strike comes in, I hardly know—leave that to Mr. Hill. Possibly he is a min(o)r. Perhaps if I did not know that Mr. Stiggins's duties partly consisted of reporting hill-climbs, it had occurred to me that he was not writing merely for amusement. You will forgive me, I am sure, if I fail to see the point of the boat incident. In my ignorance, I imagined that self-sacrifice was a matter of temperament, not of sex. And why (forgive my questioning) "the usual thing"? Most people only need to drown once (except we cats). If I do not appear sufficiently grateful for the solicitude which he evinces towards those ladies who fall off at 40 m.p.h., he must not feel hurt; it is only because—as the young lady said to the young man—"this is so unexpected."

(Miss.) MAY WALKER.

Power Required for Sidecar Work.

Sir,—A sidecarist who can claim first-hand knowledge of a 3½ h.p. and a big twin has only to give a little advice on the question, when it immediately calls forth a host of epistles telling the readers what the writers have been doing in the way of climbing hills, etc. What do they expect to do? A 3½ h.p. machine to-day can be geared down to a farce, and, theoretically (putting aside friction in the gears, etc.), can be made to haul a heavy commercial load. But air-cooled engines get tired and hot and were never intended for hauling purposes, and that is what pulling a sidecar up a long steep hill with a 3½ h.p. machine amounts to.

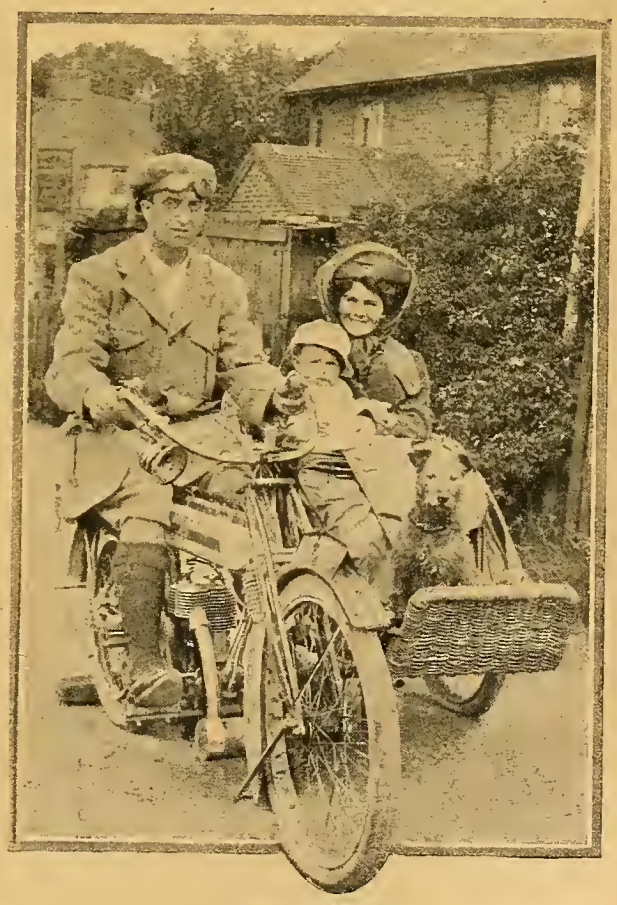
Did any 3½ h.p. men face the gale last Easter Monday? I did, on the much frequented road from Birmingham to Llandudno; but not one sidecar passed us, neither did we overtake one, so everybody on the road was going the same speed (not too much of the speed about it). The gas on full, occasionally a little extra air, the oil pump going continually, petrol also, and plenty of low gear work on the level thrown in to pile the agony on.

I hate cruelty of any kind, even to 3½ h.p. petrol motors, and after that ride of torture to both riders and motor and the gruelling which always takes place on any hill worthy of the name, whatever the weather conditions, I decided to practise it no more, but invest in a big twin, and certainly I shall not go back again to what is so often described as the marvellous 3½ h.p.

7-9 H.P.

Sir,—A word in reply to F. G. Townsend in his wholesale condemnation of the 3½ h.p. for sidecar work. If the 3½ h.p. two-speed to which he refers was of good make, one would think he must have been rather unkind to it. I have driven my 3½ h.p. two-speed Humber over 1,100 miles, fully half of them with sidecar; engine replacements to date, two new piston rings, one valve and springs. Only last Wednesday I took a ten and a half stone passenger 155 miles in the day (Dunmow to Wisbech and back, flat country I admit), the machine running perfectly and as well, or very nearly as well, as ever it did. We had several bursts of twenty-five miles an hour by speedometer. I pay my machine a good deal of attention; lots of riders do not like that work, hence the troubles we hear of. I am quite willing that Mr. Townsend take my cylinder down to ascertain wear—he will not find much.

R. H. ADAMS.



Sir,—*Re* the correspondence in *The Motor Cycle* as to the power required for sidecar work. At Whitsuntide my wife and I took a short tour on a 9 h.p. Singer tricar (1906 pattern), Riley engine and gear box (three speeds and reverse). We went *viâ* Ripon, up Wensleydale, branched off at Bainbridge as if to come down into Buckden, but instead swung round the foot of Semmerwater, and back by the other road to Bainbridge, on to Hawes, where we stopped the night. Next day we climbed the Buttertubs Pass to Swaledale, and then rode up through Keld to the Tan Hill (the highest public-house in England): from here down through Arkengarthdale to Reath and Richmond. We slipped down the Great North Road to Thirsk and finished the day's run by climbing Sutton Bank. The whole day's run was absolutely trouble free. Next day we returned home. The roads we took were in many cases excessively rough, and the gradients (as a glance at the contours will show) are very severe. We reached a point of 1,750-1,800 feet above sea level in several places.

On this run we saw many motor cycles and sidecars of all powers. One rider of a 3½ outfit we met at Aysgarth. He was going as far as Hawes, and was returning down the dale again for the very simple reason that he could not climb any of the passes or roads leading from Wensleydale into the neighbouring dales. One man on an 8 h.p. Chater-Lea with sidecar had come over from either Wharfedale or Ingleton way without trouble, and told me that he had not had too much power to spare. On the lonelier and less known parts of our run we met no motor vehicles at all, but I am sure that such bits as from Semmerwater to Countersett, Silver Hill at Keld, and one or two other places on the Buttertubs Pass, say, would effectually stop any 3½ h.p. machine and sidecar. It is common knowledge that no standard 3½ h.p. machine even in good every-day condition, with or without change-speed gear, will climb Sutton Bank with sidecar and passenger, and some of the hills we climbed were not far from being Sutton Banks, and the surfaces were worse.

On the occasion of Leathley climb on Easter Saturday, I know of a 3½ h.p. two-speed chain driven machine which was forced on to low gear on the level by wind alone.

Again, a truly variable gear gives the best chance of all, yet how many 3½ Zeniths does one see compared to their 6 h.p. models.

Perhaps, sir, the solution is that for those riders who take the main roads only, a 3½ h.p. machine is enough with two-speed gear, but the grandest and wildest, and in some cases the most picturesque scenery is a sealed book to such

A FAMILY SIDECAR.

Percy J. Newburn with his 3½ h.p. Rover sidecar combination, which is regularly used as a family turnout.

an outfit. The letters you receive from southern riders are strong testimony to this, and having ridden through nearly all the southern counties I can say that those hills I have come across were contemptible from a Yorkshire dale's point of view. How many of your southern 3½ h.p. contributors tell of tours into Devon and Cornwall.

Gradients of 1 in 7 or so are common up here in the dales and moors. Even my 9 h.p. was just enough for Sutton Bank, and no more.

In the above, of course, I am referring to machines in that every day condition in which nineteen out of twenty are found and can only be found. What a 3½ will do when tuned is another matter. — LOIDIS.

The Price of Motor Cycles.

Sir,—We all know that the motor cycle has come to stay, and we all know that the average price for a new machine is between £50 and £60. Admitting that it is excellent value for this amount, yet it is not everyone who can afford to put down such a sum, even though he does receive the utmost value for his money. Who has not heard the remark, "I would like a motor bicycle, but shall have to wait till they become cheaper"?

A great number of people have the idea that present-day motor cycles will cheapen to about half their present price in the course of two or three years. Anyone in the trade knows this cannot be done; if machines are £10 cheaper in two or three years, it is as much as they will be without sacrificing present-day refinements. Who would hope to get a 3½ h.p. magneto, various speeded touring motor cycle for about £25? This cannot be done, but I think I know what can be done for this amount. Many potential motor cyclists with limited purses would be satisfied with a much simpler mount than the ordinary machine if it could be depended upon. Supposing one could produce a simple medium weight motor cycle of about 3¼ h.p., engine to be as plain and simple as possible, fitted with a good system of dry battery ignition, and cheapened in other respects as far as luxury goes, yet fitted out ready for the road, do you think such a machine would sell at, say, from £20 to £25? By going very carefully into the matter, I think it can be done, and shall be grateful for any suggestion which anyone might offer, as I am thinking of putting such a machine on the market—that is, if there is any call for it.

WILLIAM JOHN FITCHETT.

Continental Touring—Duty on Sidecars.

Sir,—The R.A.C. Touring Department advise me as follows: In the case of motor cycles, to which are attached sidecars, etc., the above mentioned card (special Customs card, free of charge to members) does not apply, as the Continental Customs officials regard a three-wheeled vehicle as a car, and the ordinary Customs duty on cars has to be paid.

This difficulty is overcome by means of the club customs papers (triptyques).

Under this arrangement the duty is deposited with the club before departure and a set of Customs forms are issued. The duty thus deposited is returnable at the completion of the tour, provided the regulations, which are perfectly simple, are duly carried out.

So if I decide to take my bicycle and sidecar for a run down the coast after the English-Dutch Trial I must deposit with the club:

	£ s. d
For Holland, 5% *ad valorem* on, say, £60	= 3 0 0
For Belgium, 12% *ad valorem* on, say, £60	= 7 10 0
For France, £2 0s. 8d. per cwt. on 3 cwt.	= 6 2 0
	£16 12 0

or risk losing the same amount if I meet some crusty Customs officer who will not accept my version of the affair to the effect that the combination is a motor tricycle, or that I have a separate Customs card for the motor cycle and another for the sidecar.

But, perhaps, the Customs are not so black as they are painted.

Will any Continental tourists who have taken a sidecar give their experiences, and greatly oblige V.A.H.

The Glut of Open Hill-climbs.

Sir,—We read with interest your leaderette in the issue of June 13th with regard to the waning interest in hill-climbs. We are of opinion that your views are shared not only by most, if not all manufacturers, but also by all motorists interested in the sport.

Recent hill-climbs have had little interest, which may be accounted for, partly by their being so numerous, but to a great extent owing to the fact that many were of the freak character and the machines entered were hardly such as would be used for ordinary purposes.

We are staunch supporters of real sport, as we believe it materially assists in popularising motor cycling, and we are hoping you will use the great influence of your columns in supporting all types of reliability trials which embody an equal test of the rider's skill and the practical design of a motor bicycle. We should like to see more reliability trials which combine the severest tests the organisers can devise in the way of schedule time riding and combining the severest hills to be met on the main roads with very rigid specifications, so that the machines taking part shall comply with modern requirements of a high-class machine as regards its equipment for the road and not forgetting an efficient silencer and a good two or three-speed gear. Such competitions as held recently by the Coventry and Warwickshire Club we consider not only proved of great interest to the intelligent motor cyclist, but also served a very useful purpose in enabling the manufacturer to find out weak points.

THE LLOYD MOTOR ENGINEERING CO., LTD.

Petrol Consumption.

Sir,—As this is an ever interesting subject, I think it would perhaps interest other readers who cannot get good results to know what can be done with a good engine. I have a 3¾ h.p. Precision, geared 4½ to 1, B. and B. racing carburetter, which I recently drove a distance of eighty-three miles at an average speed of 29½ m.p.h., and a petrol consumption of 117 m.p.g. The journey included several stiff hills. A.H.C.

Sir,—Seeing several letters regarding petrol consumption in your paper, I think it might interest your readers to know the experiences of a late South African motor cyclist.

While in Johannesburg I owned two cycles, namely, a 3½ h.p. Humber, and, having sold this, I purchased a 2¾ h.p. New Hudson three-speed machine, geared 4, 6, and 10 to 1. I climbed all hills in the vicinity of Johannesburg on top gear, with the engine running well, and could take a person up most running on second, the third speed I rarely used except for starting. With this machine I have easily averaged 200 miles per gallon, and my brother, also a motor cyclist, can endorse my statement. I had no speedometer, and I reckoned the consumption by this means. I used to travel twenty miles or more per day, five days a week and sometimes the whole week through, and half a gallon of petrol lasted me the whole week. This works out to a little over 200 miles per gallon, which I have left it at to be on the safe side.

Seeing that this result was obtained with, I presume, the same make of engine and carburetter as the reader with the 6 h.p. Zenith, namely J.A.P. engine and B. and B. carburetter, I not only think it possible for him to do what he claims to have done on his machine, but I am certain that he could in ordinary circumstances.

W. B. SWART.

Riding Conditions in New Zealand.

Sir,—Generally speaking, our roads are not just as suitable for motor cycling as in the United Kingdom. This Dominion with its continual opening up of new country to meet the spread of the settler is compelled to build new roads, and until this work is greatly reduced we cannot expect much more attention to existing roads than they at present get. Consequently the surface of many roads leaves much to be desired.

My opinion upon the nature of machine required for this Dominion I still hold with one addition, and that is the engine clearance from the ground of the majority of machines should be greater. A large number of the machines I have seen exhibit beautiful results of the crank case, magneto, silencer, and undergear having come in contact with road obstructions. E. R. ROSKRUGE.

Westport, N.Z.

Lycett's

Speed and Reliability, Strength and Pliability.

See you get it for the T.T. Races!

Pure Para Dark Rubber, Gives Maximum GRIP. Special TOUGH CORE, 50% STRONGER than any other make, and exceptionally PLIABLE.

—It is the perfect "Power-Transmitter"—the Belt that has played such an important part in the recent LONDON—EDINBURGH, BRADFORD, BIRMINGHAM, LAND'S END records; including Mr. G. E. Stanley's SINGER Records (all made with a LYSO BELT.) Recently we gave you the Records—here we give you some of the Riders' opinions about the new "LYSO"—

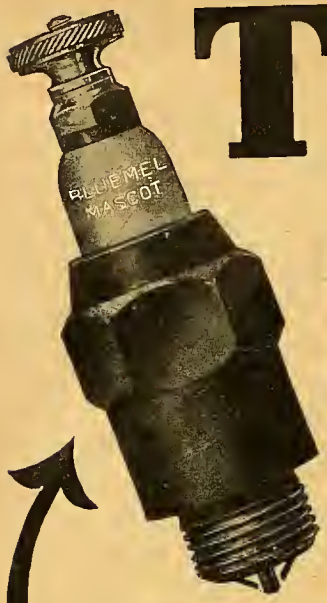
Read what users actually say of the New Dark Rubber "LYSO" in the LONDON—EDINBURGH RUN.

"I THINK IT SPLENDID.—Mr. A. Webster, on a Hobart, says—"The new LYSO BELT fitted to my Hobart for the LONDON-EDINBURGH RUN, etc., making a total of 1,000 miles, was never touched the whole journey and showed no signs of slipping. I think it splendid." AS NEW AS WHEN WE STARTED.—Mr. W. A. Jacobs, on a Rex, says—"The new 1⅛ LYSO BELTS we bought are splendid. Mr. Legrand, Mr. White, and I fitted them, and all three Belts look as new as when we started. What is more remarkable is the fact that the Belts have not frayed out at the fastening in the least."

BIRMINGHAM—LAND'S END RUN.

"GAVE ABSOLUTE SATISFACTION—NOT NECESSARY TO MAKE ANY ADJUSTMENT WHATEVER—SHOWED NO SIGNS OF WEAR.—Mr. T. Pollock on a JAMES says—"I am pleased to inform you that the new LYSO Belt gave absolute satisfaction. The belt was fitted new for the journey of over 570 miles, and it was not necessary to make any adjustment whatever, also at the end of the journey THE BELT SHOWED NO SIGNS OF WEAR." This gentleman won this event.

—Don't fail to fit YOUR mount with the New Dark Rubber "LYSO" and participate in the advantages accruing from a perfect "Power-transmitter." Obtainable of all Agents, Garages, etc., or direct, at our usual prices as below :—



Of all Agents. Prices: Size ⅝ in. 1/5; ¾ in. 1/9; ⅞ in. 2/1; 1 in. 2/4; and 1⅛ in. 2/9 per foot.

IN JAPAN WITH A SOCIABLE

HAVING read interesting accounts from time to time in *The Motor Cycle* of the doings of various makes of three-wheeled sociables, and the weekly discussions appearing on the merits and demerits of these handy vehicles, I am prompted to give an account of my experience with a 1911 model A.C. in Japan, in the hope that it may interest owners and prospective purchasers both at home and in the Colonies.

The rear wheel of my machine is shod with a 700 × 75 mm. Liversidge alternate steel and rubber-studded tyre, and the front wheels with 650 × 65 mm. plain Michelins, which combination has carried me so far 1,500 miles, over roads both good and vile, without a single puncture (umberufen!). The rear tyre is good for another 1,500 miles. The front tyres show practically no wear.

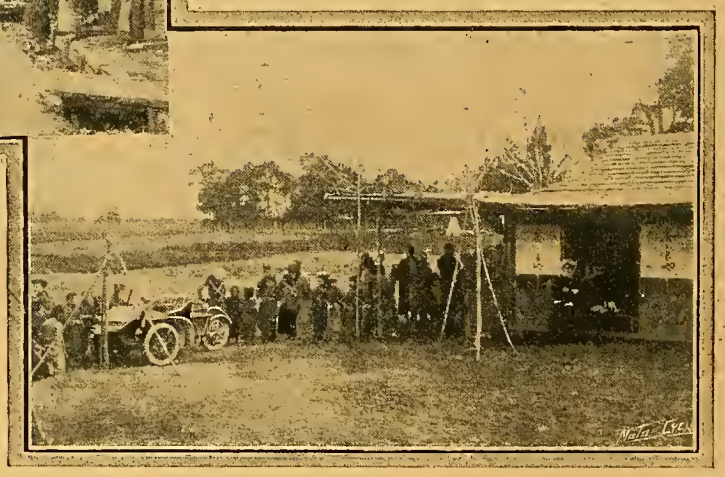
I use my little car, which I have named the "Butterfly," mostly in the city of Tokio, which covers an area of 100 square miles. Although only some ten years back this city possessed nothing but a single horse tramway, it is now traversed by a network of electric lines, and most of the streets being narrow, motoring in wet weather is no joy. Brother motor cyclists in Manchester would be in their element here! With the main thoroughfares, however, which, being modelled after European methods, are wide and excellent, no fault can be found, and though the speed limit is eight miles, this can be exceeded 500% with impunity. The Japanese Robert is not a speed specialist like our zealous officers, and looks on with utter unconcern.

There is quite a number of motor cycles in Tokio, the Triumphs leading, closely followed by the ubiquitous Humber lightweight, and I predict that in a couple of years a boom will set in. As to three-wheelers, I have only seen three or four Cyclonettes, one Kelsey Motorette (an American production), and two or three sidecars. No doubt these passenger machines will also increase in number, but at present American light cars are preferred, owing principally to the fact that there are as yet very few owner-drivers, and those who prefer to be driven naturally choose a car, not only for its appearance and comfort, but because there is only one tax for cars irrespective of class or power—that is whether they are the majestic Silent Knight Daimler or the humble 5 h.p. A.C. This motor tax, with sundry supplementary taxes, being about £8 10s. p.a., the upkeep in this country of even such an economical machine as the A.C. is almost too much for slender purses. Some improvement may be hoped for when numbers increase.

A crowd of Japanese who evinced great interest in the A.C.

The writer's A.C. sociable on one of the good military roads.

Overheating Troubles, nil.



I have made several non-stop runs of from twenty to fifty miles, the only troubles I have had being of the sooted plug order. There are some fine military roads, but after heavy rains they

In Japan with a Sociable.—

get frightfully cut up by the waggon traffic, and often have I had to cover two to three miles on the low gear over cart ruts inches deep, or in narrow lanes crawling behind a line of heavily-laden carts, without overheating. The engine has not once overheated, neither have the auxiliary fans given me any trouble, although I have read of other owners losing their fans through the holding down screw bolts working loose. I have not yet encountered a hill that I could not get up with a passenger and a full complement of accessories and spares, including the luncheon basket. The only drawback, perhaps, of the standard A.C. for Colonial use in some countries is the small ground clearance; nevertheless, I must add that I have only once "bumped" the under part of the car, and this without doing any damage beyond denting the metal shield that protects the engine. Although the A.C. has a track as wide as the average car, the short wheelbase enables me to negotiate narrow country lanes off the beaten track which abound in hairpin bends, and so we find our way to places where no motor cars have ever been seen before. One of the photographs shows my wife seated on a bench outside a tea-house, and a crowd of Japs evincing great interest not only in the wonderful "Jidosha" (self-propelling vehicle), but in the "foreigners." Another picture with the A.C. in the foreground depicts one of many military roads, along which motorists can fly to their hearts' content, but it behoves one to be careful, as, there being no rules of the road outside the city limits, the sound of a motor alarm causes great consternation, and the carts scatter all over the road.

A halt in a Japanese village. The fine condition of the road surface will be noted.

Outside a tea house; the usual crowd of sightseers.

Crowds of Children.

In passing through villages the toot-toot brings swarms of children in a moment from every house, lane, and backyard, who line the road to cheer you along. We often ask the question, "Where do they all come from?" The Japanese are certainly a prolific race. I have not yet driven my car in summer, but have no misgivings whatever as to its behaviour in the hot weather, when the thermometer often rises above 90° F. in the shade, but I propose fitting an auxiliary air inlet to the carburetter, also a Lodge double pole plug. I drain the oil from the crank case every 500 miles, and also scrape the carbon deposit from the top of the piston and the valve chambers, which I can easily do without removing the cylinder. The valves have not yet been ground in. I cannot speak too highly of the Liversidge non-skid, both as to its non-skidding and wearing properties. I use a Michelin butt-ender on the rear wheel, which I have not inflated for three months.

In conclusion, let me add how eagerly *The Motor Cycle* is awaited here by a small circle of enthusiastic motor cyclists. J.D.M.

T.T. FORM ON THE BOOK. Positions of 1912 Entrants in the 1911 Races.

Senior Race.	h.	m.	s.
1. O. C. Godfrey	3	56	10
2. C. R. Collier (disqualified)	3	57	13
3. C. B. Franklin	3	59	52
4. H. A. Collier	4	9	42
5. Hugh Mason	4	15	35
8. Quintin Smith	4	18	40
10. J. T. Bashall (rode a Bat in 1911) ...	4	24	56
11. H. Reed	4	32	45
17. J. R. Haswell	4	51	46
18. J. R. Alexander	4	58	1
20. N. F. Holder	5	5	26
22. John Gibson	5	16	37
26. F. A. Applebee	5	42	58

Also rode in 1911, but did not finish: K. Gassert, H. H. Bowen, F. Philipp, W. Creyton, J. W. Adamson, S. C. Perryman, P. Butler, A. H. Alexander (Rex in 1911, Indian in 1912), and J. Woodhouse. D. C. Bolton, J. F. Sirett, and E. Kickham rode in the Junior race last year, and did not finish. The remaining twenty-four did not take part.

Junior Race.	h.	m.	s.
1. P. J. Evans	3	37	7
3. H. J. Cox	3	55	56
4. D. M. Brown	3	56	24
6. K. Gassert	3	57	23
10. J. Haslam (Zenith in 1911)	4	4	44
17. N. D. Slatter	4	29	18

Rode in 1911 Senior: H. Mason (5th), W. H. Bashal' (7th), J. T. Bashall (10th), and W. Creyton (retired).

The other fifteen riders did not race last year.

"For the highway or the skyway."

"300 MILES IN 282 MINUTES"

"For the highway or the skyway."

The most astonishing ride in the world. Unprecedented in the annals of motor cycle history. At Brooklands, June 20th, 1912, Mr. C. B. Franklin, on a 7 h.p. "INDIAN," — not only covered the above distance but broke —

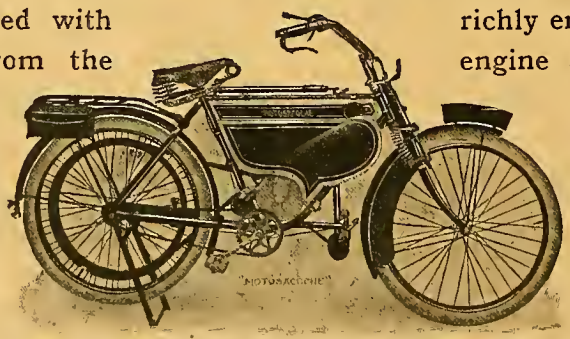
"It is by far the most luxurious seat I have used."—F. Gosnold, Tontine Street, Folkestone.

"To my mind your saddle has no rival, and I have tried all the leading makes."—E. S. Karak, 40, Adelaide Road, London, N.W.

XL-ALL, LTD., 7 & 9, Moseley St., Birmingham.



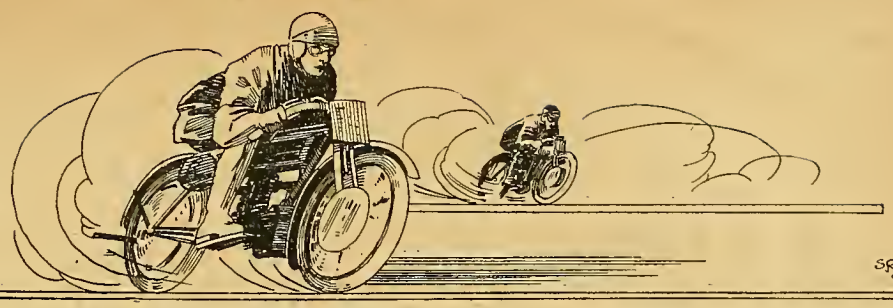
Would you own a MOTOR CAR without A BONNET over the Engine?

Yet, strange to say, some folk buy motor cycles with uncovered engines, which they practically sit on, and which fling oil all over them, the hot cylinders burning holes in their good clothes and other moving parts rubbing holes, etc., etc.

Now, with the MOTOSACOCHE

FOR GENTLEFOLK — NO VIBRATION

NO OILY DIRT — NO NOISE — NO GYMNASTICS



the engine is protected with richly enamelled shields which protect the rider from the engine and keep his clothes clean from oil and free from heat. Also they keep the engine from becoming too hot, and this is the reason why **the Motosacoche won't** overheat. **Motosacoches won't** rub or burn holes in your clothes, and it won't fling oil over them, therefore earning for itself the distinction of being

The ONLY MOTOR CYCLE for GENTLEFOLK.

¶ However, just sit down NOW lest you forget and send us a halfpenny postcard asking for our **"A"** catalogue—it is sent free of charge—and will interest you.

MOTOSACOCHE, LTD., 65, Holborn Viaduct, LONDON, E.C.

Telegrams—"Motosacoche, London." Telephone—Holborn 5439.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects

Bewdley—Swanage—Eastbourne.

(1.) May I ask the best route (surface and scenery) from Bewdley (Worcestershire) to Swanage? (2.) From Swanage to Eastbourne? Machine-a 3½ h.p. two-speed Humber and sidecar, with luggage only; no passenger.—E.C.H.

Your best routes would be as follows: (1.) Bewdley, Worcester, Tewkesbury, Gloucester, Stroud, Nailsworth, Bath, Beckington, Warminster, Shaftesbury, Blandford, Wareham, to Swanage. (2.) Swanage, Wareham, Wimborne, Ringwood, Cadnam, Totton, Southampton, Fareham, Havant, Chichester, Arundel, Worthing, Shoreham, to Brighton by the old road, Lewes, Polegate, to Eastbourne.

Iridium Points.

In view of the high price of platinum screws for replacing worn contacts of my magneto, I write to ask your opinion of the iridium contacts advertised in *The Motor Cycle*, and I should be glad of a reply to the following questions: (1.) Will iridium points wear well? (2.) Is iridium likely to cause misfiring or injure the windings of the armature? (3.) Does iridium require "facing up" oftener than platinum? (4.) In the advertisements is "Jebron" identical with and a trade name for iridium?—PLATINUM.

(1.) Iridium points are quite satisfactory. (2.) It will not cause misfiring or injure the magneto. (3.) No, not so far as our experience goes. (4.) Jebron is the name of a certain type of contact point, made by J. E. Brown, of Plumstead.

Registration of Runabouts.

Will you kindly give me the following information for a Morgan three-wheel runabout: (1.) The most suitable county to apply to for registration low numbers. (2.) Where to apply to for driving 5s. and taxation 20s. licence? (3.) Size of the number plates for a three-wheeler.—A.J.L.

(1.) We should recommend you to apply to one of the following Irish counties: Carlow, Clare, Donegal, Fermanagh, or Monaghan. (2.) Driving licence, nearest police office; local taxation licence, any post office. (3.) If over 3 cwts. car size number plates will be necessary. As a three-wheeler, however, it pays a motor cycle local taxation licence.

The Firing Intervals on a V Twin.

Can you tell me at what angle my cylinders should fire, and the order in which they should fire? Angle of cylinders 90°. Should they not fire thus: No. 1, firing; No. 2, suction (down stroke); No. 1, exhaust; No. 2, compression (up stroke)? Should they fire at 180° on the wipe contact, or 135°?—J.F.C.

Your assumption that No. 1 cylinder should be firing while No. 2 is on suction stroke, No. 1 exhausting with No. 2 on the compression stroke, is quite correct, but, of course, No. 2 cylinder being at 90° with No. 1, its suction stroke does not begin until the firing stroke of No. 1 is half way through. This means that between the beginning of the firing stroke in No. 1 and No. 2 cylinders, two complete strokes of No. 1—firing and exhaust—have to be taken besides half of the suction stroke; in other words, the crank has to turn a full revolution + 90°, that is 450° in all. As the contact maker shaft turns only half a revolution to every complete revolution of the main shaft, No. 2 cylinder contact should follow behind No. 1 at a distance of 225°. Thus the firing intervals will be in the proportion of 225 to 135, provided both connecting rods are on one crankpin.

Leicester to Bournemouth.

Will you kindly tell me the best route from Leicester to Bournemouth, also about the distance? I do not object to passing through towns for the best and nearest route. Shall I have to pass through any known police traps, and shall I encounter many bad hills on my journey? What is the most suitable gear to use for solo?—H.B.

Your best route would be as follows: Leicester, Lutterworth, Rugby, Southam, Banbury, Oxford, Abingdon, East Ilsley, Newbury, Whitchurch, Winchester, Romsey, Cadnam, Lyndhurst, Christchurch, to Bournemouth. We do not know of any police traps except an irregular one at Christchurch. There are no hills to speak of. Gear about 4¾ to 1 for 3½ h.p.

Dr. and Mrs. Fawssett (Chater-Lea and Lowen sidecar) and A. D. Arter (James), of the Birmingham M.C.C., leading a string of competitors in the M.C.C. Team Trial.

Harrogate to Brooklands.

(1.) Would you kindly tell me whether there will be any motor cycle races at Brooklands on August Bank Holiday, and if so what time the meeting starts? (2.) Could you also work out a route to Brooklands from Harrogate with the approximate mileage, and missing the large towns?—C.E.H.M.

(1.) There will sure to be at least two motor cycle races at Brooklands on August Bank Holiday. The Brooklands meetings always start at 2 p.m. (2.) Your best route from Harrogate to Brooklands would be as follows: Wetherby, Aberford, Doncaster, Bawtry, Retford, Tuxford, Newark, Grantham, Stamford, Stilton, Eaton Socon, Biggleswade, Paldock, Stevenage, Hatfield, St. Albans, Watford, Rickmansworth, Uxbridge, Colnbrook, Staines, Chertsey, Weybridge, to Brooklands. The distance is approximately 236 miles.

Rubber Belts. Red-hot Exhaust Pipe.

(1.) Are all the rubber belts on the market internally constructed of canvas fabric? (2.) What is the reason of occasional overheating when driving with sidecar and passenger? (3.) Is it safe to continue driving when the exhaust pipe gets red hot? (4.) Will gauze placed in the induction pipe atomise the petrol and improve the running? (I have been informed that a vast improvement results from such a procedure.)—B.J.B.

(1.) Yes, rubber belts are built up on canvas fabric. (2.) Simply that the engine, being air-cooled, is not able to get rid of the heat developed, probably through being over-driven. (3.) Yes; this does not much matter, but it points to the ignition being too late. (4.) The experiment mentioned here is certainly worth trying. In cold weather, however, the gauze gets choked up through water forming owing to condensation.

Loss of Power.

I have recently purchased a 1910 3½ h.p. machine, which does not develop more than two-thirds of the power which I think it should. Geared 5½ to 1, it will climb White Hill, Henley, on the main London-Henley Road, steadily but not fast, and requires the throttle full open to do it. Compression is very good, and the engine was recently taken down (about three weeks ago), and seemed in good condition. It requires a lot of extra air even to start from cold. My weight is 10 stones 8 lbs. I think it should be able to climb the hill (which is threequarters of a mile long and about 1 in 8 at the steepest) on a 4½ gear, which is what I want to run on if possible. Will you please advise me what to try? I have not much experience.—J.R.A.

Perhaps you are using rather too large a jet. It is not right that you should require extra air when starting from cold, unless the throttle has to be fully opened. Also the valve springs may have become somewhat weak, and this may account for loss of power. You should certainly climb 1 in 8 with a 4½ to 1 gear.

Cleaning Cylinders.

Can you recommend any of the new methods advertised for removing carbon deposit from cylinder? I cannot remove my cylinder without taking off the flywheel, and taking down crank case, timing gear, and magneto. Does it do any harm to scrape carbon off by means of a bent piece of steel introduced by way of the valve cap opening?—J.C.

Probably the most satisfactory way would be to run the machine over to Messrs. Sully and Co., 10, Old Town, Clapham, S.W., and let them clean your cylinders by the oxygen process, which is quite satisfactory, very quickly done, and not expensive. Cleaning by means of a scraper does not do a bit of harm, provided that it is carefully done, but it cannot be properly done without taking the cylinder off. Of course, the oxygen method is rather more thorough.

EXPERIENCES WANTED.

"A.H.C." (Bristol). D.H.K. free engine hub.

"R.N." (Denbigh). L.M.C. water-cooled with sidecar.

"T.Z." (Monmouth). P. and P. decompressor.

"W.H.D.S." (King's Cross). Cowey and Jones speedometers.

"W.A.B." (Woldingham). Two-cycle engines, hill-climbing, petrol consumption and all-round efficiency.

"E.H." (London, S.W.) Mabon variable gear fitted to an 8 h.p. engine.

"A.S.J." (Ilfracombe). 1912 Lincoln Elk for solo and sidecar use.

"W.B.S." (Manchester.) 2¾ h.p. twin Humber with and without three speeds.

"W.D.W." (Liverpool). Open belt drive on a 2½ h.p. 1911 Motosacoche.

[If "W.H." will send a stamped envelope, his letter will be answered.—ED.]

KINGSTON MILLS BRADFORD-ON-AVON, WILTS.

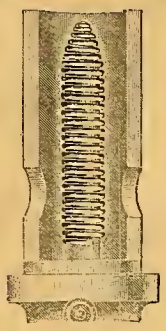
Dear Sirs, 30th May, 1912.

On Monday last with my 3½ h.p Ariel and sidecar I journeyed from Thetford to Haywards Heath in 5 hrs. using Huile de Luxe. Being unable to purchase any in Haywards Heath, the shop not being open at 8 o'clock, on the following journey I bought some————Oil and filled the tank, with the result that the engine simply would not pull like it had done.

Not thinking that a change of oil would make so much difference.

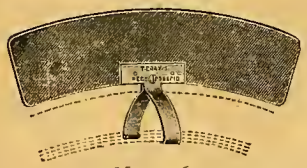
I changed the plug and cleaned the points and overhauled the carburetter, but, still could not get satisfaction.

After much coaxing and lowering of gear we managed to get to Stevenage where we emptied the tank of the other oil and filled up with Huile de Luxe at Butler's garage.



After the first mile, the engine picked up its accustomed vigour and the muffled exhaust changed to a healthy bark, enabling me to finish the journey without a grumble having learnt a lesson never to do long journeys without a spare tin of Huile de Luxe.

Congratulating your company on its excellent product.



Yours faithfully, F. C. K.

THE "BURNETT" PATENT SUCTION-CUP TYRE.

NON-SKID

TESTIMONIAL.

30, Upper Sandhurst Road.
Brislington.
BRISTOL.
March 27th, 1912.

Messrs. The Burnett Motor Tyre Co.,
Melksham, Wilts.

Dear Sirs,—It is with much pleasure that I express to you my satisfaction of excellent results I have had from one of your Special 3-ply Motor Cycle Tyres, which I purchased from you in 1910.

I fitted tyre to the rear wheel of my 4½ h.p single-cylinder motor cycle, sidecar attached, and ran about 3,000 miles without having the least bit of trouble, not even a puncture. I have since removed tyre to wheel of sidecar, and after 1 000 miles is still in excellent condition.

It is also interesting to note that during the time tyre was running on rear wheel of motor cycle, I used no less than three tyres of well-known makes on front wheel, which caused me no little inconvenience.

I may also add that I found tyre excellent as a non-skid during bad weather and far superior to any other make of tyre which I have ever tried.

Yours truly, W. H. WHITE.

184, Great Portland Street, W.

Tele { phone: 4839 Mayfair.
grams: "Motenance, London."

For the convenience of tourists the size of the book has been made suitable for the pocket or valise.

Know your road before you start.

It will save much time and discomfort.

"The Motor Cycle" Route Book contains carefully selected routes for the whole of the British Isles, with distances clearly shown; 45 Sectional Maps and Index Map (by Bartholomew), Speed Limits, and a copious index.

In every case the BEST route—and not necessarily the shortest—has been chosen. Large towns, congested districts, and bad roads are avoided.

Before commencing a tour every motor cyclist should study this book carefully. He will be well repaid by the added enjoyment which comes of freedom from worry.

Price 1/6 net. **By Post 1/9.**

Obtainable from ILIFFE & SONS LTD., 20, Tudor Street, LONDON, E.C.

And from all Booksellers and Bookstalls. *(Remittance should accompany orders sent by post.)*

WHY HESITATE?

We supply any make of Motor Cycle, Tricar, or Runabout, at from £10 down, and the balance by instalments within 12 months! What can be fairer? What can be better? The trifle that we charge extra for the accommodation you will never miss, while you have the pleasure of riding the machine; you have the pleasure of having a new machine, and your Capital is left untouched. Don't hesitate, remember we have the machines in stock, ready for immediate delivery. We are NOT advertising from other people's lists, neither are we advertising from other people's stocks. We have bought the largest stock of new Motor Cycles in the whole world, and we recommend the following, amongst which, where more than one Model is made, we stock the lot:

Rudges, Scotts, P. & M.'s, Bradburys, Zenith, Humbers, Matchless, Bat-Jap, Clyno, Premier, Morgan Runabout, A.C.'s, G.W.K.'s, Motosacoches, Lincoln Elks, Rex-Japs, etc., etc.

We can also supply any of the high-class accessories, such as F.R.S. and Lucas Lamps, and all other things that you can mention. You need not go further. They will all be added to the bill, and can be paid for on the same terms.

If you have the cash, you save money by dealing with us.

We have a few second-hand machines left, also a few hundreds of pounds worth of accessories, and these you can hear all about by writing for one of our lists—free to all.

Remember, in the past we did the largest swapping trade in the kingdom, and we are now hoping to do the largest Deferred Payment trade in the kingdom. Our terms are better than others, and our reputation has stood the test of time. We DO NOT sell our debts to Jewish Moneylenders, who will serve you with a writ the first time you miss. It is our interest to treat you well, and you will find us do so.

In the matter of deliveries, remember that all high-class Motor Cycles are difficult to get hold of. WE have them, and want YOU to have them. We are still at the same address, and have no other depots.

The canaries are in full song, and if you come to Morecambe, don't forget to come in and see them.

We can now Garage you, Bhoys, please remember that, and shall be glad for you to blow in.

Note the old address:

Hitchen's, Ld.,
MORECAMBE.

Telephone: 112.
Telegrams: "Motor, Morecambe."

WRITE—CHAPPELL & CO., 11, Hatton Garden, LONDON.

See that Security Sleeve?

It overcomes the one disadvantage of the Butt-ended Tube—bursting at the ends. It is the feature of the **"Challiner" Patent Butt-ended Tube.** With it you have the security of the endless tube and the handiness of the butt-ended one.

The Security Sleeve is fixed to the rim by the winged nut and bolt; the butt ends of the tube fit in it like a glove.

The centre of the Security Sleeve is a bulkhead of insulated canvas which makes *bursting of the ends an impossibility.*

'Challiner' Patent Butt-ended Tubes are burst-proof at the ends.

If a tyre fitted with this tube were inflated to bursting point, *the burst could not occur at the ends.*

The bulkhead keeps the Tube ends firmly in position; and being fixed to the rim directly opposite the valve, it prevents all 'creeping.' "Creeping" of the Butt-end Joint is what causes other tubes to burst.

Fit "Challiner's" to your mount now!

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns.—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Somerset, Devon, Dorset, and Cornwall.

SECTION X.
Scotland.

SECTION XI.
Ireland and Isle of Man.

'Phone: Holborn, 5777.
Wires: "Opificer, London."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

LAMPS on SIDECARS.

The compulsory fitting of lights to sidecars is bound to come. We saw this long ago, and for the past 5 months have included a lamp with all our sidecars without extra charge.

OUR REED CANE BODIES

have undoubtedly hit the mark.

Undoubtedly this class of cane is far superior and more classy than ordinary cane or wicker work, besides being considerably lighter. These beautiful sidecars appeal to those who want absolutely the best.

Model E

£7 10s.

Model F

Crowned by its own Successes!

For many seasons our bands have been recognised as the entirely dependable

Motor Cycle Detachable Bands.

The prices are moderate, and the lasting qualities are unique. May we send you full particulars?

Roberts Belts are as good as their Bands —further recommendation is unnecessary. Illustrated particulars free on request.

THE ROBERTS MOTOR TYRE CO.,
Gripwell Works, St. Mary's Row, BIRMINGHAM.

"U.H." MAGNETO

Represents the highest development in ignition apparatus.

POINTS WORTH REMEMBERING.

The "U.H." magneto requires no adjustment. It furnishes a spark more powerful than that produced by a battery system. Moreover, its heat is so intense that the sparking plugs will never become short-circuited from soot, as any deposit is burned off as quickly as it forms.

Booklet post free on request.

Two-speed Hub

"MILLENNIUM" MAKE

Completes the luxury of Motor Cycling by giving wonderfully easy control, such as the Car driver enjoys. It is the last word in 2-speed Hubs, being exceptionally efficient, reliable, and durable. Both gears controlled by friction clutches. Unimpaired efficiency on High Gear. Fits almost any machine. Full particulars supplied on request.

READY TO FIT.

In answering these advertisements it is desirable to mention "The Motor Cycle."

The Topic of the Hour.

"The Evolution of Transmission."

THE belt drive has been weighed in the balance and found wanting. It is a cause of too much worry, labour, and expense, especially in rainy weather. Many experienced motor cyclists are abandoning much-loved and lauded machines because they are belt driven. The chain drive does not prove the way out; it also has faults—too well-known to need detailing—which are beyond correction. The evolution of transmission in the motor cycle is proceeding in the same direction as that in the car, namely, towards bevel gear shaft drive. It is the only system of transmission which experience has proved thoroughly efficient and reliable.

Present day opinion is consolidating in favour of the shaft-driven motor cycle.

THE makers of the F.N. machines are the pioneers of the bevel gear shaft drive in motor cycling. It is nearly seven years since the first gear-driven 4-cyl. F.N. motor cycle was introduced. In those years we have brought this form of transmission to the highest pitch of efficiency, with the result that the number of F.N. riders grows by leaps and bounds.

The machine of the Future will be the machine of To-day — the bevel gear shaft-driven F.N.

REMEMBER, the F.N. has a long lead—the others a big leeway to make up. Choose the machine which offers you the best service and the best value, and your choice must be an

"The Car on Two Wheels."

"The Car on Two Wheels."

The shaft drive is only one of many great features in the F.N.—"the car on two wheels." There are the multiple disc clutch contained in the fly-wheel; the automatic lubrication; the automatic carburetter; the special F.N. forks, etc., all exclusively F.N. design.

Write for our Booklets—post free— which give full information on all points.
